

Gainesville Public Library Association.

Regulations in Relation to the Retention of Books.

1. Each member of the Association may withdraw one volume, and retain the same ten days, with the privilege of renewing for ten days longer.

2. A fine of two cents per day shall be imposed for the detention of every book beyond the limited time; and if a book be not returned within three months, it shall be deemed lost, and the borrower shall, in addition to his fine, forfeit its value.

3. Should any book be returned injured, or marked by pencil or otherwise, the borrower shall pay for the injury or replace the book, as the Library Committee may direct; and if a book belonging to a set be lost, the borrower shall pay the full value of the set, and may take the remaining volumes.

4. No member shall be permitted to receive a book from the Library until he shall have paid all sums due from him to the Association.

5. Members of the Association are earnestly requested not to loan Library books to persons who are not members.

6. No Reference Book is to be taken from the Library.

Popular Dictionary

OF

GENERAL KNOWLEDGE.

EDITED BY

GEORGE RIPLEY AND CHARLES A. DANA.

WITH SUPPLEMENT.

VOLUME VI.

DEMPSTER—EVERETT.

NEW YORK:

D. APPLETON AND COMPANY,

1, 3, AND 5 BOND STREET.

LONDON: 16 LITTLE BRITAIN.

1881.

ENTERED, according to Act of Congress, in the year 1859, by D. APPLETON AND COMPANY, in the Clerk's Office of the District Court of the United States for the Southern District of New York.

ENTERED, according to Act of Congress, in the year 1874, by D. APPLETON AND COMPANY, in the Office of the Librarian of Congress, at Washington.

ENTERED, according to Act of Congress, in the year 1880, by D. APPLETON AND COMPANY, in the Office of the Librarian of Congress, at Washington.

Among the Contributors of New Articles to the Sixth Volume of the Revised Edition are the following :

Prof. CLEVELAND ABBÉ, Washington, D. C.

DEW.
EARTHQUAKE.
ECHO.
ELASTICITY.

Prof. C. W. BENNETT, D. D., Syracuse University.

DEMPSTER, JOHN.
DICKINS, JOHN.
DURBIN, JOHN PRICE, D. D.
EMERY, JOHN and ROBERT.

FRANCIS C. BOWMAN.

DUSSEK, JOHN LOUIS,
ERNST, HEINRICH WILHELM,
and other musical articles.

W. T. BRIGHAM, Esq., Boston.

EUCALYPTUS,
EUPHORBIA,
and other botanical articles.

EDWARD L. BURLINGAME, Ph. D.

DOUGLAS, FAMILY OF,
DRESDEN,
EPAMINONDAS,
and other articles in biography and geography.

ROBERT CARTER.

DIPPEL, JOHANN KONRAD,
DISRAELI, BENJAMIN and ISAAC,
DOUGLAS, STEPHEN ARNOLD,
EASTER ISLAND,
EGYPT,
and other articles in biography and geography.

JOHN D. CHAMPLIN, Jr.

DIANA,
DONATI,
DREAM,
DRUSUS,
ENGRAVING,
ECKMANN-CHATRIAN,
and articles in biography and geography.

Prof. E. H. CLARKE, M. D., Harvard University.

DIAPHORETICS,
ELATERIUM,
ETHER,
and other articles of materia medica.

Hon. T. M. COOLEY, LL. D., Ann Arbor, Mich.

DIVORCE,
DOMAIN,
DOMICILE,
DOWER,
EASEMENT,
and other legal articles.

Prof. J. C. DALTON, M. D.

ELLIOT, GEORGE THOMSON,
and medical and physiological articles.

EATON S. DRONE.

EDUCATION,
EMIGRATION,
and various articles in American geography.

Col. H. A. DU PONT, U. S. A.

DU PONT, SAMUEL FRANCIS.
DU PONT DE NEMOURS, PIERRE SAMUEL.

ROBERT T. EDES, M. D., Harvard University.

Articles in materia medica.

THE AMERICAN CYCLOPÆDIA.

DEMPSTER

DEMPSTER, John, an American clergyman, born in Florida, Fulton co., N. Y., Jan. 2, 1794, died at Evanston, Ill., Nov. 28, 1863. His father, the Rev. James Dempster, though educated at the university of Edinburgh and bred a Presbyterian, was a colaborer with John Wesley, and was sent by him as a missionary to America, and died while his son was a child. Becoming a peddler of tinware, young Dempster manifested no marked characteristics till his conversion in his 18th year, when he set about repairing the defects of his earlier education by most persistent study. In 1816 he was admitted into the Methodist general conference, and till 1825 was stationed at various places in Canada and New York. In 1835 he was sent as missionary to Buenos Ayres. Returning in 1842, for three years he had charge of churches in New York city. Meanwhile he had decided on Newbury, Vt., as a favorable site for a theological seminary, which soon after was removed to Concord, N. H. Here in 1847 was inaugurated the Biblical institute, which now constitutes the school of theology of Boston university. After seven years' labor in this institute, Dr. Dempster departed for the west, to seek a favorable location for the second in the chain of theological seminaries that he proposed to establish between the Atlantic and Pacific coasts. A property for the adequate endowment of a Biblical institute in or near Chicago was obtained, and he was appointed senior professor in 1856. The steps he had taken for planting like institutions at Omaha, and next in California, failed, chiefly from the financial revolution which the entire country suffered in 1857. Preparatory to a contemplated journey to the Pacific coast to further his favorite plan, he submitted to a surgical operation that proved fatal. He left very extensive manuscripts, only one volume of which has been published, "Lectures and Addresses" (Cincinnati, 1864).

DEMPSTER, Thomas, a Scottish professor and author, born at Muiredale, Aberdeenshire, Aug. 23, 1579, died near Bologna, Sept. 6, 1625. He was the 24th in a family of 29 children by the same mother, and at the age of three mastered the alphabet in one hour. He went in his 10th year to the university of Cambridge, and studied for some time at Pembroke hall, whence he passed over to France. For several years he wandered from one university to another, and in 1596 he received the degree of D. C. L., and was appointed regent of the college of Navarre in Paris. His violent and quarrelsome temper often involved him in serious broils with his fellow students and professors. He was subsequently engaged as professor for brief periods at Toulouse and Nîmes, and early in the 17th century went to Scotland to recover a portion of the paternal property. Returning to Paris, he was for seven years connected with various colleges of the university, and while acting as temporary principal of the collège de Beauvais he preserved the most rigid discipline in that institution. He afterward went to England, and was appointed by James I. historiographer royal. In 1615 he received from the king a handsome present in money, but his hopes of preferment being defeated by the opposition of the clergy on account of his being a Roman Catholic, he betook himself in 1616 to Pisa, where for several years he lectured on the civil law. A personal difficulty induced him to go to Bologna, where, after engaging in a number of disputes, he rose to eminence as professor of humanity, was knighted and pensioned by the pope, and loaded with distinctions. In the midst of this prosperity his wife eloped with a student, and the mental and physical suffering which he experienced in an attempt to overtake the fugitives put an end to his life. Dempster's works are exceedingly numerous, and embrace a variety of subjects. He wrote

and spoke Greek and Latin with great facility, and was thoroughly versed in philosophy, civil law, and history. His elaborate works, *Antiquitatum Romanarum Corpus Absolutissimum* and *De Etruria Regali*, evince remarkable industry and erudition. His *Historia Ecclesiastica Gentis Scotorum* is a biographical dictionary of Scottish worthies, in which fable and fact are mingled. Many names of authors who never were in Scotland are claimed as Scottish, and the history of many others who never existed is given with minute particularity. He was as remarkable for personal courage and skill in the use of weapons as for scholarship.

DEMURRAGE (Lat. *demoror*, to delay), in maritime law, the detention of a vessel beyond the time allowed by the charter party (or by custom if there is no special contract) for loading or unloading or sailing; also the compensation paid or damages claimed for such detention. It is usually stipulated in the contract between the owner of the ship and the freighter that the ship shall not be detained beyond a certain time for the loading or delivery of goods, or for sailing. If there is no such stipulation, the time is fixed by usage, and called lay days. The claim for demurrage is reciprocal, by the owner against the freighter, and by the freighter against the owner; the latter case being, however, only for delay in sailing. Demurrage is allowed only for voluntary detention, and not for any accidental delay; as, if a vessel is detained for a cargo over the stipulated time, and after sailing is driven back by a storm, which would have been avoided if she had started at the time appointed, no damages are allowed for the incidental delay. Yet it would perhaps be otherwise if by the detention a further delay is caused by anything which could be foreseen, as a periodical wind, or the freezing up of a harbor, or the like. In inland transportation, where the latter cause of delay most frequently occurs, as upon rivers or canals, the rule is that the carrier is not responsible for the delay when there has been no fault on his part, but is entitled to deliver the cargo after the breaking up of winter, and earn the entire freight; or if the freighter elect to take the goods at the place of detention, he must pay *pro rata itineris*. But if there has been voluntary delay by either party, in consequence of which the vessel is frozen up by the coming on of winter, he is responsible for damages; but the measure of such damages would not be according to the rule of demurrage in respect to sea vessels.

DEMURRER, in law, an exception by a party to a suit to the sufficiency of the pleading of the opposite party. In the common law courts a demurrer may be general or special; the former specifying no particular ground of objection, and therefore raising only the question of the sufficiency in substance of the pleading demurred to; the latter being a specification of certain objections to the form of the plead-

ing. It may be interposed by either party to the last pleading of his opponent, but on the argument the sufficiency of any prior pleading may be inquired into, and judgment will be given against the party committing the first substantial error. In equity the demurrer is only applicable to the complainant's bill. A demurrer always raises a question of law to be determined by the court; but if the pleading demurred to is held bad, liberty to amend is usually given, unless the case is such that amendment can be of no avail.

DENAIN, a town of France, in the department of Le Nord, on the left bank of the Scheldt, which is here navigable, and on the Northern railway, 6 m. W. S. W. of Valenciennes, and 14 m. E. S. E. of Douai. Owing to the successful working of the neighboring coal and iron mines, the population increased from 900 in 1826 to 11,022 in 1866. The town has manufactories of iron and of beet sugar. Denain was the scene of a brilliant victory achieved in 1712 by the French under Villars over an army of the allies commanded by the earl of Albemarle.

DENARIUS, a Roman silver coin, containing at first 10, and afterward 16 ases, first coined in 269 B. C. The average weight of a large number of denarii shows them to have con-

Roman Denarius (exact size).

tained about as much silver as three half dimes of our currency. The *denarius aureus* was a gold coin, the average value and weight of which it is difficult to determine. The specimens in the British museum differ much in these respects. The gold denarius does not seem to have been in common use in Rome.

DENBIGH, a municipal and parliamentary borough, market and county town of Denbighshire, North Wales, built on an eminence near the centre of the vale of Clwyd, 22 m. W. of Chester, and 180 m. N. W. of London; pop. of the borough in 1871, 6,322. The principal edifices are three Anglican churches, one Catholic and four dissenting chapels, a town hall, grammar school, lunatic asylum, and a spacious market hall. The shoe and leather trade is the main support of the town, but Denbigh is best known as a pleasant spot for retirement. Denbigh castle, a magnificent edifice, parts of which are well preserved, is supposed to have been built by Henry Lacy, earl of Lincoln, who received the lordship of this place from Edward I. Edward IV. was besieged in it by the army of Henry VI., and Charles I. took refuge here after the battle of Rowton Heath in 1645. At the close of the civil war it was garrisoned by royalists, but after a siege of two months

surrendered to the parliamentarians by order of the king. A great part of its defences was blown up after the restoration.

DENBIGHSHIRE, a maritime county of North Wales, bounded N. by the Irish sea, and bordering on England; area, 603 sq. m.; pop. in 1871, 104,266. Its surface is much diversified; there are some level tracts in the north, but along the E. and W. borders extend mountain ridges. The principal rivers are the Conway, Dee, and Clwyd, none of which are navigable within its borders. The valleys and level tracts are remarkably fertile, producing grain, beans, and peas; the uplands yield some crops of barley, oats, and potatoes, but are mostly occupied by pastures; cattle, sheep, and goats are reared in great numbers, and excellent cheese is made. Among the minerals are coal and iron, both very valuable, lead, slate, freestone, and millstone. Immense quantities of limestone, used for fluxing ironstone, are exported into Staffordshire, and the yield of one quarry, near Llan-gollen, is said to be sometimes between 70,000 and 100,000 tons in a single year. The county has no seaport, and its chief channel of transportation is the Chester and Holyhead railway, which crosses it near the coast. The Chester and Shrewsbury railway runs S. about 14 m., just within its E. boundary. A branch of the Ellesmere canal traverses the vale of Llan-gollen. The chief towns are Denbigh, Ruthin, and Wrexham.—Before the Roman conquest

Denbighshire was the territory of the Ordovices, and it was annexed to the empire only after long struggles. It contains several interesting Roman remains. It was the scene of many fierce contests under the Saxons and the Normans, in the wars of the Roses, and in the revolution of the 17th century.

DENDERAH (anc. *Tentyra*), a ruined town of Upper Egypt, near the left bank of the Nile, in lat. $26^{\circ} 10' N.$, lon. $32^{\circ} 37' E.$, 40 m. E. S. E. of Girgeh. Its antiquities are among the most interesting and complete in Egypt. The principal building is a magnificent temple, enclosed with some other edifices, in a space 1,000 ft. square, by a wall of sun-dried brick, 15 ft. thick and 35 ft. high. It was dedicated to the goddess Athor or Aphrodite, or, as some believe, to Isis. A richly sculptured gateway faces it in the enclosing wall, on which the emperors Domitian and Trajan, whose names occur in accompanying inscriptions, are represented in the act of worship. The portico of the temple

is 135 ft. wide, and has 24 columns arranged four deep, each 32 ft. high and nearly 22 ft. in circumference. The capitals have a full face of the presiding divinity on each of their four sides; the architrave is covered like the portal with sculptures representing a religious procession, and the projecting fillet of the cornice bears an inscription in Greek setting forth that the portico was added to the temple in the reign of Tiberius Caesar, in honor of the goddess Aphrodite. On the ceiling of the portico is the famous basso-relievo, at first supposed to represent the signs of the zodiac and to be of very remote antiquity, discovered in 1799 by the French savants under Bonaparte; and on the ceiling of one of the inner chambers was a small and somewhat similar planisphere, which was removed to Paris in 1821. But the supposed zodiac lacks the sign of Cancer, and all scholars are now agreed that it is not older

Ruins at Denderah.

than the Ptolemies, and that a zodiac was not used under the Pharaohs. In the portico or on the front of the temple may be distinguished the names of Augustus, Caligula, Claudius, Nero, Ptolemy Caesarion, and his mother Cleopatra. The last two are also represented by rude portraits. The interior consists of three large halls, an isolated sanctuary, and several small chambers. Rows of columns stand in some of the rooms, displaying on their capitals the budding lotus, and all the apartments but two are profusely sculptured. The roof is flat and formed of oblong masses of stone. Small holes cut in the ceiling or sides admitted the light, and some of the rooms on the ground floor were lighted only by the few rays which found their way through apertures communicating with the rooms above. There are two smaller temples of Roman date near that of Athor, one dedicated to Isis.

DENDERMONDE, or **Termonde**, a town of Belgium, in the province of East Flanders, at the

junction of the Scheldt and Dender rivers, 16 m. N. W. of Brussels; pop. in 1867, 8,300. It contains nine places of worship, many charitable and educational institutions, an academy of design and architecture, and several fine private collections of art. In the church of Notre Dame are two pictures by Vandyke and other works of art. The surrounding country is fertile, and produces the finest flax in Flanders. An active trade is carried on in this article, in grain, linseed, hemp, and oil, and in various manufactures, the most important of which are woollen cloths, cotton yarn, and lace. The town is supposed to date from the 8th century. Many Roman antiquities have been found in the neighborhood. In 1667 it resisted a siege of Louis XIV. by opening the sluices. In 1706 it was taken by Marlborough only after a long drought, and in 1745 by the French. The present fortifications date from 1822, and the bridge over the Scheldt from 1825.

DENDROBIUM, a genus of epiphytes or parasitical plants, found chiefly in the damp tropical parts of Asia, and belonging to an order remarkable for the grotesqueness as well as beauty of its flowers. The species number more than 200, and vary from a very small plant to a very tall one. In some instances they affect dry and open places on the bark of trees in Australia, and even on bare rocks exposed to the sun. Dr. Royle found *D. alpestre* on the Himalaya mountains, at an elevation of 7,500 ft. The flowers of most species are of some shade of purple; some are of a rich yellow, and a few are green. They possess a high fragrance. In cultivation they thrive best when planted in pots filled with earth, but require an artificially elevated temperature to insure success.

DENGUE, a term of uncertain derivation, used to denote an epidemic disease popularly known in this country as the breakbone fever. It prevailed extensively in the West India islands in 1827 and 1828, and at the same time in many parts of the southern states of the Union. It was at that time described by Prof. Dickson, then a resident of Charleston, S. C., and the same author subsequently published several papers relating to it. It prevailed in Philadelphia in 1780, and was described by Dr. Rush. It is supposed to be identical with epidemics variously designated which have occurred at different periods in other parts of the world. The disease is an essential fever which has a short career, the average duration being about 36 hours. Sometimes it commences abruptly, and sometimes the development occupies several days. The usual symptoms of fever are present, namely, frequency of the pulse, increase of temperature, loss of appetite, chilly sensations, thirst, lassitude, &c. The disease, however, is characterized by excruciating pains in the head and eyes, and in the muscles of the neck, loins, and extremities; hence the name breakbone fever. An eruption frequently occurs, but its character differs in different cases.

It resembles sometimes the eruption of scarlatina; hence the name *scarlatina rheumatica* has been applied to an epidemic supposed to be identical with this by Cocke and Copland. The eruption in some cases resembles that of measles, and in other cases it is like lichen or urticaria. Vesicles like those of sudamina and varicella have been observed. Erysipelas and purpura may occur, the latter being sometimes accompanied by hæmorrhage from the nose, mouth, bowels, or uterus. Convalescence is apt to be tedious, and relapses are not uncommon. Rheumatism, abscesses, boils, and carbuncles are occasional sequels. This epidemic rarely occurs except in warm climates, and it prevails especially in cities and large towns. The number of persons affected is sometimes remarkable. Dr. Wragg computed the number of cases at one time in Charleston, S. C., at 10,000, and during the epidemic seven or eight tenths of the population were affected. It attacks persons of either sex and of all ages. The epidemics have a brief duration, rarely extending beyond six or eight weeks. The causes are unknown. Prof. Dickson regarded the disease as contagious, but this view is not generally held, and it is opposed by facts which render it untenable. Although the intensity of the fever is great, the disease is rarely if ever fatal. This is explained by its short duration, and the absence of any important complications. The treatment consists chiefly in the use of opium in some form to alleviate the pains, and in other palliative measures. The convalescence is hastened by tonic remedies, together with a restorative diet.

DENHAM, Dixon, an English traveller, born in London, Jan. 1, 1786, died in Free Town, Sierra Leone, June 9, 1828. He entered the British army in 1811, and served with credit through the Peninsular war and in all the subsequent campaigns against Napoleon. In 1815 he travelled through France and Italy, and on returning to England devoted himself to military studies. In 1821 he joined the government expedition to Africa, under Oudney and Clapperton, with the rank of major. Setting out from Tripoli, the expedition arrived at Moorzook, in Fezzan, April 8, 1822. Here its progress was stopped by the refusal of the sultan of Fezzan to furnish an escort across the desert. After considerable trouble Denham started for England to lay the matter before the government, but was recalled from Marseilles, where he was detained in quarantine, the expedition having received an escort and permission to proceed, mainly in consequence of his activity and firmness. They crossed the desert to Lake Tchad, which they reached in February, 1823. Leaving his companions at Kuka to recruit their health, Denham explored the region around the lake, and afterward joined an expedition of the Arab escort against the natives to the southward. In a disastrous fight Denham was wounded and separated from the company, and found his way back to Kuka through great

perils and suffering. He afterward continued his explorations of the interior, and returned to England with Clapperton in 1825. In 1826 he published in London his "Narrative of Travels and Discoveries in Northern and Central Africa, in the years 1822, 1823, and 1824." In the same year he was promoted to the rank of lieutenant colonel and appointed superintendent of the liberated African department of Sierra Leone, and in 1828 governor of the colony.

DENHAM, Sir John, an English poet, born in Dublin in 1615, died in London, March 19, 1668. In 1641 he published "The Sophy," a tragedy, which was praised by Waller, and had an immediate success; and in 1643 appeared his poem "Cooper's Hill," on which his fame rests. The following two famous lines occur in the apostrophe to the Thames in that poem:

Though deep, yet clear; though gentle, yet not dull;
Strong without rage, without o'erflowing full.

During the imprisonment of Charles I. Denham performed many secret services for him, and being detected fled to France. On the restoration he was appointed surveyor general of the royal buildings.

DEMINA, Giacomo Maria Carlo, an Italian historian, born at Revello, Piedmont, Feb. 28, 1731, died in Paris, Dec. 5, 1813. He took holy orders, acted as professor at Pinerolo and Turin, and was subjected to persecutions on the part of the Jesuits. About 1782 he went to Berlin, in compliance with an invitation of Frederick the Great, and wrote there his *Rivoluzioni della Germania* (8 vols., Florence, 1804), several works on North German literature (in French), and an effusion in praise of Peter the Great (*La Russiade*, Berlin, 1790). While at Mentz in 1804 he was introduced to Napoleon, to whom he dedicated his *Clef des langues* (Berlin, 1804), and who shortly afterward appointed him imperial librarian at Paris. Demina wrote many other literary, critical, and historical works; but his literary fame rests chiefly upon his *Istoria delle rivoluzioni d'Italia* (3 vols., Turin, 1769-'70; best edition, Milan, 1820; translated into several European languages), which contains a general history of that country from the time of the Etruscans. He left in manuscript three volumes of a history of Piedmont, which have not been published in Italian, but have appeared in German.

DENIS, or **Denys** (Lat. DIONYSIUS), Saint, apostle and first bishop of Paris in the 3d century. He was one of a company of missionaries who were sent from Rome, about 250, to revive the drooping church in Gaul; and after preaching in various parts of that country and suffering much at the hands of the pagans, he arrived at Lutetia (Paris), where he made many converts. He built a church there, and made it the seat of his bishopric. During the persecution under Aurelian he was condemned to death by the Roman governor Pescennius, and with a priest named Rusticus, and a deacon Eleutherus, was beheaded in 272. The bodies

were thrown into the Seine, but were recovered by a Christian woman, Catulla, who caused them to be interred near the scene of the execution. A chapel was built over the spot, and after it had fallen to ruin was replaced by St. Genevieve with a church in 469, which was afterward united to the famous abbey of St. Denis, founded by Dagobert about 636. St. Denis became the patron of the kingdom, and his name served as a war cry to the French, who used to rally in battle at the words *Montjoye Saint Denis*. His festival is kept Oct. 9. The popular belief that after his decapitation he walked about with his head in his hands may have originated in the ancient paintings, which represented him so engaged, as an emblem of the manner of his death.

DENIZEN, in English law, an alien born who has received by letters patent from the king certain privileges belonging to natural born subjects. Thus he may take lands by purchase or devise, but not by descent. In American law there is no middle class of this kind between aliens and citizens, unless we may designate as such those who have declared an intention to become citizens, but have not become fully naturalized. In some of the states, by statute, such persons are allowed to take and convey real estate, the difference between them and aliens being that, although the latter can take real estate and hold it until some proceeding is taken by public authority to divest the title, commonly called office-found (*i. e.*, an inquest by official action), yet upon such proceeding being had, the land would escheat to the state although the alien should have conveyed to another. Another signification is sometimes attached to the term, in a more popular sense, though it is also to be found in some law writers, viz., a resident. This meaning is not wholly inconsistent with the other, as it may at an early period, when the doctrine of citizenship was not well settled, have been understood of the children of aliens born in England. By the present law of that country such children are recognized as subjects, except in certain cases, as the children of persons representing or in the service of foreign governments who are temporarily in England. The same rule is recognized in the United States, and as a consequence it was thought necessary to provide by law that the children of Americans born abroad should be held to be American citizens.

DENIZLI, a town of Asia Minor, on the main road between Smyrna and Isbarta, 110 m. S. E. of the former and 70 m. W. of the latter place; lat. 37° 50' N., lon. 29° 15' E.; pop. about 7,000. The town, which is situated not far from the base of the Baba Dag (the ancient Mount Cadmus, on the confines of Caria and Phrygia), in a well wooded country, has been called the Damascus of Anatolia on account of the beauty of its surroundings. There are many villas in its environs, and the hills are covered with vineyards. Within the town

are two khans, a bazaar, and numerous tanneries. The chief manufactures are red and yellow leather and morocco, made from sheep and goat skins, raisins, and a kind of grape sirup which is used instead of sugar. Denizli is the capital of a sanjak in the vilayet of Aidin. In 1715 it was destroyed by an earthquake, in which 12,000 people perished. About 5 m. N. is the town of Eski Hissar, with the ruins of ancient Laodicea.

DENMAN, Thomas, lord chief justice of England, born in London, Feb. 23, 1779, died at Stoke Albany, Northamptonshire, Sept. 22, 1854. The only son of Thomas Denman, M. D., author of a well known work on midwifery, he graduated in 1800 at St. John's college, Cambridge, was called to the bar in 1806, returned to parliament for Wareham at the general election of 1818, and in 1820 for Nottingham, representing that town from this time till 1826, and again in 1830-'31. In 1820 he took a distinguished part as solicitor in the trial of Queen Caroline. In 1822 he was appointed common serjeant of the city of London; from 1830 to 1832 he was attorney general; and from 1832 till 1850, he was chief justice of the king's bench. He was raised to the peerage in 1834. His "Life," by Sir Joseph Arnould, was published in 1873.

DENMARK (Dan. *Danmark*, Ger. *Dänemark*, Fr. *Danemark*, "the land or mark of the Dane;" called also the *Danske Stat*, "state of Denmark"), a kingdom in the north of Europe, situated between lat. 54° 30' and 57° 45' N., and lon. 8° 5' and 12° 45' E.; the small island of Bornholm, in the Baltic, lies in lon. 15° E. It is bounded N. E. by the Skager Rack, N. E. and E. by the Cattegat, the Sound, and the Baltic, S. by Femern strait, the Little Belt, and Schleswig, and W. by the North sea. It consists of the peninsula of Jutland and the islands of Seeland, Fünen, Laaland, Falster, Langeland, Møen, Samsø, Läsö, Arrö, Bornholm, and many smaller ones; besides which it possesses the Faroe islands, Iceland, and Greenland, and the islands of Santa Cruz, St. Thomas, and St. John, in the West Indies. The following table shows the area and population of Denmark and its colonies in 1870:

MAIN DIVISIONS.	Area in sq. m.	Population.
Seeland, Møen, and Samsø.....	2,584	637,711
Bornholm.....	225	31,894
Fünen, Langeland, and Arrö.....	1,815	236,311
Laaland, Falster, &c.....	640	90,706
Jutland.....	9,738	788,119
	14,752	1,784,741
COLONIES.		
Faroe islands.....	510	9,992
Iceland.....	39,753	69,763
Greenland (region free from ice).....	46,774	9,825
West India islands.....	119	37,821
Total.....	87,161	127,401

The Danish colonies in the East Indies and Africa were acquired by Great Britain in 1846.

The duchies of Schleswig, Holstein, and Lauenburg, which formed more than one third of the kingdom, were lost by the Danish crown in 1864.—The seacoast of Denmark, along the North sea, the Skager Rack, the Cattegat, the Sound, the Baltic, and the Little Belt, is more than 900 m. long, and generally low, flat, and sandy. Next to Copenhagen the principal seaports are Elsinore, Odense, Aarhus, Aalborg, and Frederikshavn. The fiords or arms of the sea which indent the coasts are among the most remarkable natural features of the kingdom. The Liim or Lym fiord entirely insulates the N. part of Jutland; it was formerly separated from the North sea by a narrow strip of land, through which in 1825 the sea broke in two places. The Ringkiöbbing fiord in W. Jutland and the Ise fiords in Seeland are also notable for their size. The lakes are numerous, but small, and some contain excellent fish. Since the loss of the duchies, the only rivers deserving mention are the Varde, flowing into the North sea, and the Guden, 80 m. long, flowing into the Cattegat. The broad passage called the Great Belt lies between the islands of Seeland and Fünen, and the Little Belt separates Fünen from Jutland and Schleswig. The surface of the kingdom is an almost unbroken plain, in most places but a few feet above the ocean, and in others below the level of the sea. The N. W. part of the peninsula is a desolate region, over which tempests and drifting sands sweep with destructive fury. To consolidate the soil and break the force of the winds, various kinds of trees and shrubs, of which the improvidence of former generations had nearly stripped the country, are now planted here, and their destruction is forbidden under severe penalties. From the promontory of Skagen, at the extreme north, a low barren ridge runs through Jutland, attaining an elevation of upward of 500 ft. The island of Fünen contains a range culminating at the height of 400 ft., called the Fünen Alps, and Seeland has eminences of about the same height. All the rocks belong to the tertiary and upper secondary formations, and, with hardly an exception, are disposed in regular strata. Several species of chalk are found, above which is an extensive boulder formation traversed by seams of lignite, and above this again beds of clay and marl are spread over a large part of the country. The soil is almost wholly alluvial, and in the E. part of Jutland is covered with rich vegetable mould. The N. and W. parts of Jutland, however, are sandy wastes, and for 200 m. along the coast there is an almost continuous line of sterile flats called *Klitte*. The larger islands are fertile and characterized by a rich marshy loam, interspersed with occasional tracts of moor. The climate, owing to the low and almost entirely insulated position of the country, is temperate and humid, the cold being greatest in Jutland. The winters are seldom severe for that high latitude, and rather milder than

in the northern parts of Germany, though in January and February the thermometer sometimes falls to 22° below zero. The extreme heat is about 85°. The shortest day is 6½ hours, and the longest 17½. The weather is very variable, but thunder storms seldom occur. Violent winds, rains, and fogs frequently occur, and drought is rare. The mineral products are of little value, and are confined principally to fullers' earth, potters' and porcelain clays, freestone, and salt. Coal mines were formerly worked in the island of Bornholm, but are now abandoned; peat is abundant, and amber is collected on the shore of the North sea. The fine forests which once adorned Denmark have decayed or been cut down, and of the scant woods which remain, chiefly on the coast of Jutland and in the island of Fünen, one fourth is the property of the crown. Pine, beech, oak, and birch are the principal varieties of timber. The crops are wheat, rye, oats, barley, buckwheat, peas and beans, potatoes, other common vegetables, and fruits. A great portion of the land is devoted to pasturage, and the rearing of horses and cattle forms a considerable source of national wealth. Cattle are valued chiefly in connection with the dairy, from which is drawn the principal revenue of the farm. The breeds of horses are excellent for cavalry or for draught; sheep are kept more for their milk (of which butter is made) and their flesh than for their wool; there are three species of swine, and poultry of all kinds abounds. In 1866 there were 352,603 horses, 1,193,861 horned cattle, 1,875,052 sheep, and 381,512 swine. The rivers and fiords furnish valuable fish, among which are the herring, cod, mackerel, and salmon.—More than half the population are engaged in agriculture, which is conducted with great industry; but from the subdivision of land into small farms it is seldom carried on with appliances requiring much outlay. The art of husbandry, however, is steadily progressing. Manufactures are also making progress. They comprise silk, linen, woollen, and cotton goods, leather, lace, gloves, straw hats, sail cloth, thread, paper, soap, glass, earthenware, plated ware, iron ware, saltpetre, gunpowder, arms, refined sugar, tobacco, soda, potash, brandy, and malt liquors. The peasantry make most of their wearing apparel and domestic utensils with their own hands.—Lying between two seas, in easy communication with all the maritime nations of Europe, commanding the entrance to the Baltic, abounding in good harbors, and possessing a large body of hardy and excellent seamen, Denmark enjoys unrivalled facilities for commerce, and besides its own import and export traffic conducts a large carrying trade for other countries. The principal articles of export are grain, butter, cheese, brandy, smoked and salted meats, horned cattle, horses, skins, hides, whale and train oils, fish, eider down, woollens, tallow, and bristles. Among the imports are wines, salt, drugs, silk, wool, cotton, cotton fabrics, timber, coal, iron,

colonial produce, spirits, glass, flax, hemp, coffee, rice, tobacco, and whalebone. During the five years 1868-'72 the average annual imports from Germany and England were respectively £2,000,000 and £1,500,000, and the exports to those countries £3,500,000 and £2,300,000. The trade with Sweden and Russia is also extensive. In 1871 the entrances were 41,411 vessels of all descriptions, of 1,064,582 tons, and the clearances 41,705 vessels, of 644,052 tons; for the foreign trade alone, entered 18,457 vessels, of 745,264 tons; cleared 18,298 vessels, of 347,478 tons. The merchant marine consisted of 2,727 sailing vessels over 4 tons each, of 176,093 tons, 88 steamships of 12,007 tons, 11 tugs of 642 tons, and 10,610 boats under 4 tons. Until about the close of the 18th century the commerce of Denmark was oppressed by legislative enactments which tended more to the immediate emolument of the crown than to the general prosperity and wealth of the kingdom. Imported manufactures had to be sold at auction by the revenue officers, and the importer received the proceeds after the duties had been deducted. These duties were excessively high; monopolies were often granted to rich companies for trading even with the colonies; and heavy taxes were also laid on the domestic traffic between different provinces. But at the close of the 18th century a more liberal policy began to prevail; the customs regulations assumed the form of a more permanent tariff; many of the most burdensome restrictions were taken off, and commercial treaties have since been made on a basis of reciprocity with the United States and other nations. Connected with the commercial regulations was the question of the Sound dues, which a few years ago acquired considerable prominence. The Sound is a strait leading from the Cattegat into the Baltic, between Seeland and Sweden, its width at the narrowest part being about 3 m. Both coasts were once owned by Denmark, which has consequently from a forgotten period claimed the right of imposing tolls on all vessels navigating this passage. This exaction was from time to time resisted by various nations, and several obtained exemption either by payment of an annual commutation or by treaty. In 1848 the United States government declared its purpose not to submit any longer to the old usage. The Danish government offered to renounce its claim for a sum the interest of which would equal the annual revenue derived from the tolls; and the result of this offer was the assembling of a conference of the European powers at Copenhagen in the first months of 1856, at which Denmark agreed to accept as compensation for the removal of the tolls the sum of 35,000,000 rix dollars (\$19,145,000), payment of which was to be apportioned among the various states interested in the trade of the Baltic. The proposal was accepted by the United States as well as other powers, and a convention between the former and Denmark was signed in Washington, April 11,

1857. Great Britain paid 28·90 per cent. of the indemnity, Russia 27·80 per cent., Prussia 12·60 per cent., and the United States 2·03 per cent. or \$393,011.—The domestic shipping trade of Denmark is very large, and as no inland point is much more than 40 m. from the sea, most of the internal communication is carried on by water. The Daneskiold canal is in the island of Seeland, and that of Odense connects the capital of Fünen with the sea. The principal railroad line runs from Copenhagen via Røskilde to Korsør on the Great Belt; another line goes through the island of Fünen, and there are several lines in Jutland running from Aalborg to the frontier of Schleswig with branches. The total length of railroads at the beginning of 1872 was 530 m. In 1870 there were 1,225 m. of telegraph, with 3,160 m. of wire and 150 stations. The high roads, which are wide, macadamized, and well kept, are under the care of a corps of royal engineers.—The inhabitants of Denmark are almost entirely Scandinavians. The business language is everywhere Danish, even in the West India islands. In Iceland, and less purely in the Faroe islands, the old Norwegian or Icelandic is spoken. The Danes are an industrious, patient, and contented people, and make good soldiers and seamen. They have regular features, blue eyes, and light hair. The religion of Denmark is Lutheran, but all creeds are tolerated. The national church is governed by seven bishops nominated by the crown. It embraces almost the whole population, and has at Copenhagen a missionary college founded in 1777, and a seminary for approved candidates in divinity. According to the census of 1870, the Lutherans numbered 1,769,583; Jews, 4,290; Baptists, 3,223; Mormons, 2,128; Roman Catholics, 1,857; Reformed, 1,433; free congregations, 1,211; other sects, 811; and 205 were without any creed. The Baptists have about doubled their number during the last ten years. Some progress was also made by the Catholics, who are under the administration of a vicar apostolic. In 1873 this office was filled by the Prussian bishop of Osnabrück. Great attention is paid by government to education, and there is in the ministry a department of public worship and instruction, under which are superintendents for the several divisions of the kingdom. The ministers appoint teachers and regulate the course of studies in the public schools, of which some are free. Every village has at least one school, and there are more-over 22 gymnasia and 7 normal seminaries. There are asylums for the deaf and dumb, and literary and scientific institutions of various kinds are established throughout the country. Every child between the ages of 7 and 14 is obliged by law to attend some school, and it is rare to meet a Danish peasant, however poor, who cannot read and write. The university of Copenhagen, which dates from 1478, has 40 professors and upward of 1,100 students, and

there are colleges in all the large towns, besides 2,940 public schools. The number of periodicals is large in proportion to the population.—The government of Denmark is a hereditary constitutional monarchy. By the constitution of June 5, 1849 (which was modified in some important respects in 1855 and 1863, but was restored, with various alterations, by a statute which received the royal sanction July 28, 1866), the king must confess the Evangelical Lutheran religion, and give his oath to the privy council of state that he will maintain the fundamental laws. He attains his majority at the age of 18. All his ordinances must be countersigned by the minister of state, who is appointed by him, and is responsible to the king or diet before the supreme court of the state. The king appoints officers, declares war, and concludes treaties of peace, alliance, and trade; but he cannot alienate the territory or essentially modify the political relations of the state without the consent of the diet. By the organic law of 1866 the Danish diet or *Rigsdag* consists of two chambers, the *Folkething* or lower house, and the *Lands-thing* or upper house, which assemble every year on the first Monday in October. The proportion of representation in the lower house is one deputy for 16,000 inhabitants, the deputies being elected for three years. The upper house numbers 66 members, of whom 12 are nominated for life by the king, the rest holding their office only for eight years. The diet proposes laws, which are not valid till sanctioned by the king; and taxes cannot be imposed without its consent. The supreme court of the kingdom consists of 15 members, 5 of whom are chosen from the diet, and 10 from the high courts of the country. Personal freedom, freedom of the press, religious freedom, the inviolability of private residences, and the right of public assembly are secured. The highest court of the kingdom is the privy council of state, presided over by the king. The administration of the government is carried on by eight responsible ministries: of foreign affairs, of interior affairs, of justice, of public worship and instruction, of war, of naval affairs, of public works, and of the finances. The budget of 1873-'4 estimates the net receipts at 23,736,161 rix dollars, and the expenditures at 22,989,633. (The rix dollar is about 60 cents.) The chief source of revenue is from indirect taxes, which bring nearly 10,000,000, while the greatest expenditure is for the payment of the interest on the debt, which with the sinking fund demands upward of 7,000,000. The national debt, March 31, 1872, was 114,660,781 rix dollars.—Every able-bodied male inhabitant of the age of 22 is bound to enter the army, the term of service being four years in the line and four years in the reserve; and every person who has served his time is also liable to be enrolled under the second call. The infantry numbers 20 battalions of the line and 10 of the reserve, besides a battalion of royal guards; the cavalry consists of 5 regi-

ments; the artillery of 2, forming 12 batteries, and 2 battalions of sappers and engineers. The numerical strength of the army on a peace footing is 36,782 rank and file, with 1,058 officers; on a war footing, 47,925 rank and file. The navy in September, 1872, comprised 25 screw steamers (6 ironclads, 12 unarmored vessels, and 7 gunboats) and 6 paddle steamers. The commercial navy in 1871 numbered 2,735 vessels (exclusive of those of less than 4 tons) with an aggregate tonnage of 181,494. The principal arsenal for both army and navy is at Copenhagen, the capital and principal town.—There is no authentic account of the early settlement of Denmark, but the Cimbrs seem to have occupied the continental part of it toward the end of the 2d century B. C. Some three centuries later the country was occupied by the Goths, whose chief Skiold, according to the legends the son of Odin, is mentioned as the first monarch of Denmark. During the 8th and 9th centuries the Danes, then the foremost among the Northmen (see *NORTHMEN*), began to acquire renown by their maritime expeditions, in which they invaded England and Scotland and conquered Normandy. In the 9th century the different states of Denmark became united under one monarch, and in 1000 and 1014 Norway and the greater part of England were added to the kingdom. In 1017 Canute, under whom Denmark became Christian, completed the conquest of England, where his race continued to rule till 1042. The feudal system was introduced into Denmark in the 12th century, and contests took place here between the sovereign and the barons similar to those which convulsed England during the same period. In 1387 Margaret, styled the northern Semiramis, widow and successor of Haco, king of Norway, and daughter of Waldemar III., a descendant of Canute, mounted the thrones of Denmark and Norway, and, claiming the Swedish crown also in right of her husband, vanquished a competitor in that country, and united the three powers by the compact of Calmar in 1397. But the Swedes always resisted this union, and after a series of contests, in which they were finally led by Gustavus Vasa, seceded from it in 1523. During this period the population dwindled, the seas swarmed with pirates, commerce fell away, and incessant quarrels between the king and his nobles or the latter and the clergy added to the disasters of the kingdom. On the deposition of Eric, Margaret's successor, in 1439, the states elected Christopher of Bavaria, and in 1448 Christian, count of Oldenburg, king, from whose grandson, Christian II. (since whose time all the kings have been alternately named Frederick and Christian), the crown passed in 1523 to Frederick I., duke of Schleswig and Holstein. Frederick's son, Christian III., united these two duchies to the crown 11 years later, and divided the greater part of them between his brothers, a measure which caused a long series of disturbances. In his reign a code of laws

called the "Recess of Kolding" was promulgated. In the 17th century Christian IV. sided with the Protestants in the great religious war, but was worsted by Wallenstein in 1626–7, and compelled to sue for peace. Toward the end of his reign he waged several wars with Sweden, which lasted till 1645, and cost Denmark some of its provinces. A few years later the Swedes under Charles Gustavus overran Holstein, crossed the frozen Belt into Fünen, took Odense, and invested Copenhagen, but were successfully opposed by Frederick III. In 1658 they again besieged Copenhagen, and continued their operations until the death of Charles Gustavus in 1660, when Denmark secured a peace by the sacrifice of territory. The same year was marked by the restriction of the power of the nobility and the extension of the royal prerogative. The succession, too, which had formerly been to some extent elective, was by the commons, who sided with the king in his struggle with the nobles, acknowledged hereditary in the family of Frederick. A new war with Sweden terminated in 1679, and another was occasioned in 1699 by an attempt of Frederick IV. to invade the dominions of the duke of Holstein, an ally of Sweden. Copenhagen again became the seat of war, when the Danes, terrified by the energy of the young Charles XII. of Sweden, bought peace by the payment of a sum of money, and remained neutral until the disasters of the Swedes in the Ukraine tempted them to renew hostilities. The war lasted until the death of Charles XII. in 1718, after which Sweden began to decline and Denmark to pursue the wise policy of peace. The latter half of the 18th century, embracing most of the reigns of Frederick V. and Christian VII., was the period of great reforms, under the lead of the two Bernstorffs and the unfortunate Struensee. But by a defensive alliance with Russia, Prussia, and Sweden in 1801, Denmark involved herself in a quarrel with England, suffered severely in the naval battle off Copenhagen, and lost her colonies in the East and West Indies, which were restored to her, however, by the treaty of peace which followed. In 1807, when England suspected Denmark of entering into an alliance with Napoleon, an English fleet was sent to the Baltic to compel the surrender of the entire Danish navy. The British landed near the capital, and soon forced the government to give up its fleet. A war of exasperation naturally followed. Hostilities were carried on by sea, partly at the entrance to the Baltic, partly off the Norwegian coast, the Danes fighting with spirit, and sometimes with success, and both parties suffering severely in their commerce. After the reorganization of Europe by the treaties of 1814 and 1815, Denmark was obliged to cede Norway to Sweden, as an equivalent for Pomerania, which province Denmark had received from Sweden, and which in 1815 she made over to Prussia, in exchange for the duchy of

Lauenburg and a large sum of money. Serious complications, caused in part by the fact that Denmark by the possession of Holstein and Lauenburg became a member of the German confederation, now arose between the crown and the duchies. The population of Holstein especially sympathized more with Germany than with Denmark, and an antipathy of races sprung up, which various political measures deepened into an alarming disaffection. A prominent subject of complaint was the royal succession. The expected extinction of the male line in the reigning family afforded a prospect of rendering the duchies, in which the Salic law of succession prevailed, independent of the Danish crown, and the project of annexing Schleswig to the German confederation was openly advocated in the provincial assembly. In this state of affairs Christian VIII. in 1846 issued letters patent, proclaiming that with the exception of certain parts of Holstein the laws of succession should be uniform in all parts of his dominions, the effect of which was to add greatly to the popular discontent; and when Frederick VII. mounted the throne in 1848, the duchies, emboldened by the revolutionary outbreaks of the time, resorted to arms, and appealed to their German brethren for assistance. Frederick William IV. of Prussia, then forced to yield to the current of revolution, sent a large force into Schleswig under Gen. Wrangel, which drove out the Danes, who had found little difficulty in putting down the insurgents there, and followed up its success by an invasion of Jutland. Meanwhile England and Russia interfered; an armistice was signed at Malmö, Aug. 26, on terms highly displeasing to the duchies; and although Prussia undertook a second campaign in the spring and summer of 1849, Schleswig and Holstein thenceforth relied mainly on their own resources. They placed their army under Gen. Willisen, and maintained a spirited resistance, until signally defeated at Idstedt, July 25, 1850. Prussia had now definitely withdrawn from the contest, and with Austria gave her influence on the side of Denmark. The Holstein army was disbanded, the duchies were forced to submit, and the question of succession was referred to a convention of the plenipotentiaries of the principal powers of N. and W. Europe. By a treaty signed by these representatives at London, May 8, 1852, the succession was settled upon Prince Christian of the Sonderburg-Glücksburg line and his male heirs; an arrangement which gave great dissatisfaction both to Denmark and to Schleswig and Holstein, as in the event of the extinction of this family Russia reserved the ancient right of succeeding to a portion of the duchies. The new order was announced to the diet in October, 1852, and was at once rejected. It met the same fate before a new assembly in February, 1853; but the king, guided by his new prime minister Oersted, feeling himself pledged to the foreign powers, resolved upon a second

dissolution, and the measure was finally adopted by a third parliament, June 24. The settlement of the succession, however, failed to produce a real state of peace. Holstein continued to protest against the acts of the Danish government, and the agitation was communicated to Schleswig, where the German population were a small minority, and which never formed part of the German empire. Holstein carried its complaints before the German diet, which willingly exercised its right of interference and decreed a "procedure of execution," that is, compelled the Danish government to make concessions. In the midst of these troubles King Frederick VII. died (Nov. 15, 1863), and was succeeded, according to the treaty of 1852, by Prince Christian of Glücksburg, who was crowned as Christian IX.; but Holstein refused to acknowledge the new sovereign, one party supporting the pretensions of the Augustenburg family, another asking the independent union of Holstein and Schleswig, and a third desiring a union with Prussia. An Austro-Prussian army, under the command of the Prussian general Wrangel, entered Holstein early in 1864, crossed the Eider, took Eckernförde, compelled the evacuation of the Dannevirke (Feb. 5), marched through Schleswig and Jutland as far as the Lym fiord, and captured Düppel, a strong position opposite the island of Alsén, fortified with four different lines of trenches, after a two months' siege (April 18). Soon afterward the fortress of Fridericia surrendered to the Austrians. After protracted negotiations, peace was concluded at Vienna, Oct. 30, 1864, by the terms of which Denmark ceded her rights over Schleswig, Holstein, and Lauenburg to Austria and Prussia. By the convention of Gastein (August, 1865), between Austria and Prussia, the temporary management of affairs in Holstein was assumed by Austria and in Schleswig by Prussia, while Lauenburg was sold by Austria to Prussia for 2,500,000 rix dollars; Prussia besides receiving the right to occupy the port of Kiel and Rendsburg, the use of two roads through Holstein, and the right to make a canal through that country. In the treaty of Prague between Austria and Prussia, in 1866, was inserted an article providing for the retrocession of northern Schleswig, if the people by a vote should declare their wish to return to Denmark; but no vote has yet been taken. Denmark was dreadfully exhausted by the war, but has since been gradually recovering from its prostrate condition. The marriage of the Danish crown prince to the only daughter and heir of the king of Sweden in 1869 revived the idea, long cherished by many on both sides of the Sound, of a reunion of the three Scandinavian kingdoms.

DENMARK, Language and Literature of. The Danish language (*danske Sprog*) belongs to the Gothic family of languages, which early separated into two branches: the Norsk, or Scandinavian, and the Germanic. The former, which was called by the ancient Danes the

norœna mál, northern tongue, or *dœnsk tunga*, Danish tongue, was spoken with little dialectic variation over the whole of Scandinavia, and was carried to Iceland by Norwegians in the latter part of the 9th century. The *norœna mál* developed into three distinct languages, Icelandic, Swedish, and Danish. While Icelandic retains the mother tongue almost unaltered, Danish has lost nearly all its distinctive features. Foreign elements were introduced into it principally in two ways: Anglo-Saxon, by the Danish invasions of England in the 11th century; German, in consequence of the warlike expeditions of the Waldemars (first, 1157-'82; second, 1202-'41; third, 1340-'75, &c.) and other Danish kings, of the wars and commerce with the Hansa, and in consequence of the rule of German dynasties (Eric VII. of Pomerania, Christopher of Bavaria, Christian I. of Oldenburg, 1448, and his successors). Its development was retarded by the use of German as the court language and of Latin as the language of literature, and in the 17th century by the inroads of French taste and phrases. In the 18th century it was again affected by the predominance of German culture, but the subsequent revival of ancient Norse studies and of a national literature developed the Danish into one of the richest and most refined European tongues. It is now not only the language of Denmark proper, but also of Norway, and of the northern part of Schleswig. It is also used in the churches among the Esquimaux in Greenland, and as a business language in the islands of Santa Cruz, St. Thomas, and St. John, in the former Danish factories in Guinea, and by well educated Icelanders. The Norwegians pronounce it a little harder than the Danes, dropping principally the soft *d*, but their literary language is entirely the same. The main difference between Danish and Swedish is that the latter has retained more of the ancient Scandinavian elements and embodied more French. Danish is also related to English and Dutch. Considering the smallness of the land in which it is spoken, it has given birth to a large number of dialects. The principal ones are: 1, the dialect of Seeland (*sjællandske*), which comprises the dialects of North Seeland (*nordsjællandske*), Copenhagen (*kjøbenhavnske*), which is the normal dialect and basis of the literary language, and the dialect of South Seeland, which includes again those of Laaland and Falster; 2, that of Fünen (*fjenske*), which is spoken in Fünen, Lange-land, and several small islands; 3, that of Jutland (*jydske*), which is verbally and grammatically the most peculiar of all, and comprises the dialects of West Jutland (*vesterjydske*) and of East Jutland (*østerjydske*); 4, that of South Jutland (*sønderjydske*), also called the dialect of Schleswig (*slesvigske*), which makes use of many Anglo-Saxon- and Low German words; 5, that of Bornholm (*bornholmske*), which has many affinities with Swedish; and 6, that of Schonen (*skaanske*), which is a mixture of

Swedish and the dialect of Seeland.—The alphabet numbers 28 letters, which are represented either in German or Latin characters. There are 9 vowels: *a*, *aa*, *e*, *i*, *o*, *u*, *y*, *æ*, and *ø*. *A*, *e*, *i*, *o*, *u* are pronounced as in German and Italian; *y* is sounded like the French *u*, and *ø* like the French *eu* in *peu*; *aa*, which is also a simple vowel, though written with two letters, has the sound of *ou* in brought; and *æ* corresponds to the German *ä*. They are generally long at the end of syllables and before liquids and labials, and otherwise short; *e* is, however, nearly always short at the end of a word, and becomes mute at the end of a syllable when preceded by a vowel; *ee* has the sound of *a* in late. *De*, the pronoun used in addressing a person, and corresponding to our *you*, is pronounced as if it were written *dä*, in order to distinguish it from *dø*, they. The consonants are the same as in English, with the exception of *v*, and are as a rule pronounced with a peculiar softness which a foreigner finds it difficult to imitate. When *d* is preceded by a vowel and stands in the middle of a word, it receives a pronunciation somewhat similar to *th* in bathe; it becomes mute when preceded in the same syllable by *l* or *n*, or by *r* after a long vowel, or when followed by *sk*, *st*, *t*, or *s* (if it is not the sign of the genitive); and it assimilates with the consonant that precedes it when it is placed between *l* and *e* or *n* and *e*, and frequently also when preceded by *ds*. When *g* stands between two vowels it is generally almost mute, and at the end of words it is sometimes as soft as an aspirate, and sometimes as hard as a *k*; *eg* is sometimes pronounced like the English *i* in lie, and *og* like *oy* in toy. In the middle of a word, before *j* and *v*, and after *t*, the letter *h* is not sounded; it serves to lengthen the vowel that precedes. In the combinations *gj*, *kj*, and *skj*, when followed by *e*, *æ*, or *ø*, the *j* is frequently silent. *N* is nasal before *g* and *k*; in *ps* the *p* is mute in words derived from Greek, and the sound of *v* is lost at the end of a word when preceded by *l* or *r*. Diphthongs are: *ai*, *ei*, *oi*, *ui*, *øi*, *au*, *eu*, and *ou*. The first two are pronounced like *i* in lie; *oi* like the English *oy*; *ui* like the English *e*; *øi* very nearly like *oy*; *au* like *ou* in house; *eu* like the French *eu*, with a final sound of a *v*; *ou* as in brought. The accent rests mostly on the root syllable, except when the word begins with *gjen*, *mis*, *sam*, *u*, *und*, or *ran*, or ends in *eri*, *inde*, *artig*, or *ere*.—Two genders are distinguished: *fælleskjøn*, common, and *intetkjøn*, neuter; only the personal pronoun of the third person and a few suffixes have separate forms for the masculine and feminine genders; four fifths of the nouns in the language are common, and only the names of countries, cities, metals, letters, languages, clothing material, and a few others, are *intetkjøn*. The definite article of a noun preceded by an adjective is *den* in *fælleskjøn*, *det* in *intetkjøn*, and *de* in the plural of both genders; thus: *det skjøne Land*, the fine country; *den*

gamle Stol, the old chair; plural, *de gamle Stole*. When there is no adjective it is suffixed to the noun, after dropping the *d*; thus: *Land-et*, *Stol-en*, the country, the chair; but it is *ne* or *ene* in the plural, as *Lande-ne*. The indefinite article, derived from *eet*, *een*, a, one, is *et*, *n*, *en*; e. g.: *et Land*, a country, *en Stol*, a chair. The nominative, dative, and accusative cases cause no change in the noun; there is only the suffix *s*, *es*, for the genitive of both numbers. The plural is formed in three ways, viz.: by suffixing *e*, as *Land-e*; or by *er*, as *Sag*, thing, *Sag-er*, things; or by leaving it unchanged with the exception of the radical *a* and *o*, which assume the forms of *æ* and *ø* in many nouns of the three declensions, as *Barn*, child, *Børn*, children; *Bog*, book, *Bøger*, books. Adjectives not preceded by the article or preceded by the indefinite article remain unchanged in *fælleskøn*, and receive *t* in *intetkøn*, singular, and *e* in the plural of both genders; but when they are preceded by the definite article they receive *e* in both genders and numbers; thus: *god Dreng*, good boy, *en god Dreng*, a good boy, *gode Dreng*, good boys, *den gode Dreng*, the good boy, *de gode Dreng*, the good boys; *stor*, large, *stort Bord*, a large table, *store Børde*, large tables. The comparative degree is formed by adding *re* or *ere*; the superlative by *ste* or *este*; e. g.: *et lærdere Fruentimmer*, a more learned woman; *den hvideste Farve*, the whitest color. Some of the irregulars are: *ung*, *ynge*, *yngst*, young, younger, youngest; *lille*, *mindre*, *mindst*, little, lesser, least; *megen*, *mere*, *meest*, much, more, most; *mange*, *flere*, *fleest*, many, more, most; *god*, *bedre*, *bedst*, good, &c.; *ond* or *slem*, *værre*, *værst*, evil or bad, worse, worst; *gammel*, *ældre*, *ældst*, old, &c.; *nær*, *nærmere*, *nærmest*, near, nearer, next; *ydre*, *yderst*, utter, utmost, &c. The numerals are: *eet*, *een*, 1; to, 2; *tre*, 3; *fire*, 4; *fem*, 5; *six*, 6; *syr*, 7; *otte*, 8; *nå*, 9; *ti*, 10; *elleve*, *tolv*, *tretten*, *fjorten*, &c.; *tyve*, 20; *een og tyve*, 21; *to og tyve*, 22; *tredive*, 30; *fyrgetyve*, 40; but the following four decades are peculiar: *halvtreds* or *halvtredsindstyve* (half 60 and 20) for 50; *treds* or *tredsindstyve* (3 times 20), 60; *halvfjerds* or *halvfjerdsindstyve* (half 80 and 20, only equal to 60), used for 70; *fjirs* or *fjirsindstyve* (4 times 20), 80; *halvfems* or *halvfemsindstyve*, 90; *hundrede*, 100; *tusende*, 1,000. *Treds*, *fjirs*, and *fems* being taken for 60, 80, 100, supposing them to be doubled, the *halvtreds*, *halvfjerds*, and *halvfems* are taken for 50, 70, and 90, as the decades half way toward 60, 80, 100. The ordinals are: *det*, *den første*, the first; *det andet*, *den anden*, the other, or second; *den tredje*, the third; *den fjerde*, the fourth; *den sjette*, the sixth; the rest are formed by suffixing *ende*, or *nde* when the number ends in *e*, or *de* when it ends in *en*. Time (French *fois*) is *Gang*, as *anden Gang*, the second time, *ni Gange*, nine times, &c. The personal pronouns are: *jeg*, I; *mig*, me; *du*, thou; *dig*, thee; *han*, he; *hun*, she; *hans*, his; *hendes*, (of) her; *ham*, him; *hende*, her;

vi, we; *vores*, ours; *os*, us; *I*, you; *eders* (*jer*), yours; *eder* (*jer*), you; *Dem*, yourself; *sig*, himself, herself, themselves. The demonstratives *de*, *deres*, *dem*, are used for they, their, them. *Selv*, self, selves; but *hanselv*, himself, means also master of the house, *hunselv*, herself, the house-lady, &c. The possessives are: *mit*, *min*, plural *mine*, my, mine; *dit*, *din*, *dine*, thy, thine; *sit*, *sin*, *sine*, its, his, her, their; *vort*, *vor*, *vore*, our, ours; *jert*, *jer*, *jere*, your, yours. The demonstratives are: *det*, *den*, genit. *dets*, *dens*; plural *de*, *dem*, genit. *deres* (also used in conversation with one or more persons, like the German *Sie*, *Ihnen*, *Ihr*, you, your); *dette*, *denne*, *disse*, this, these; *hiint*, *hiin*, *hine*, that, those; *saadant*, *saadan*, *saadanne*, and *sligt*, *slig*, *slige*, such. The relatives are: *der*, who; *som*, who, whom, that; and the interrogatives: *hvo*, who? *hvad*, what? *hvilket*, &c., which? Indefinite pronouns: *der*, it, there, also with passive verbs; *man* (also German, the French *on*), one, some one; *noget*, *nogen*, plural *nogle*, some, any; *somme*, some people; *intet*, *ingen*, nobody; *alt*, *al*, plural *alle*, all; *hvert*, *hver*, *enhver*, *ethvert*, every; *hinanden*, each other; *hverandre*, one another. The theme of the verb is the imperative; the conjugation comprehends two orders subdivided into three classes each, according to the form of the past tense.

I.—SIMPLE ORDER (present and past indicative, and participle past).

- 1st conj. { 1. *Klager*, complain, *klagede*, *klaget*.
2. *Brænder*, burn, *brændte*, *brændt*.
3. *Følger*, follow, *fulgte*, *fulgt*.

II.—COMPLEX ORDER.

- 2d conj. { 1. *Beder*, beg, pray, *bad*, *bedet* or *bedt*.
2. *Faar*, receive, *fik*, *faaet*.
3. *Lader*, load, *lod*, *ladet*.
3d conj. { 1. *Slipper*, escape, slip, *slap* (plur. *sluppe*), *sluppet* or *sluppen*.
2. *Riser*, tear, rip, *rev* (plur. *reve*), *revet* or *reven*.
3. *Byder*, offer, *bød* (plur. *bude*), *budet* or *buddt*.

Person and number are distinguished by pronouns or other words; the numbers of verbs are often alike, and are confounded in common speech, though distinguished in writing. The passive voice admits of no distinction of numbers or persons in the form of the verb, but merely of tenses and modes. The present and past tenses are formed by means of the suffix *s* or *es*; thus: *Jeg elsker*, I am loved; *jeg elskedes*, I was loved (from *jeg elsker*, I love; *jeg elskede*, I loved or have loved). The infinitive is sometimes denoted by *at*, to; thus: *at elske*, to love; the participle present by *nde* final. There are also deponent verbs, analogous to those of the Latin. The auxiliary or periphrastic verbs are: *skal*, plural *skulle*, shall; *skulde*, should, &c.; *vil*, plural *ville*, will; *vilde*, participle *villet*, would; *har* (from *haver*), have; passive *haves*, be possessed by; *er*, am; *var*, was; *vær*, be; *fuaer*, get; *maa*, may, must; *kan*, can, may; *tor*, dare, need; *lader*, let, cause to, &c. *Bliver*, become, forms the passive sense; e. g.: *bliver fundet*, is found. *Har* and *fuaer* with an infinitive also

express duty: *Jeg har at sige Dem*, I have to say (to) you. The Danish has more varieties of circumlocution than the English, and its auxiliaries are less irregular. The syntax resembles that of the English. The definite article may be omitted, but it is sometimes used where the English omits it; thus: *Natur-en*, nature; *Liv-et*, life, &c. The noun which governs a genitive precedes the nominative, and usually without the article; e. g.: *Verdens Alder*, the age of the world; *et Legemes* (body) *Tyngde*, the gravity of a body; *mange Vandes Lyd*, of the sound of many waters. The preposition *af* is omitted with quantities, as *en Mængde Mennesker*, a crowd of people; unless the thing measured be definite, as *en Skieppe af den ny Hvede*, a bushel of the new wheat. Adjectives follow only surnames, as *Knud den Store*, Canute the Great. *De*, they, when used to address a single person, takes the singular of the verb, as *Gaaer De paa Komædie?* Do you go to the theatre? The active participle in *nde* final is never used as a gerund, but mostly as an adjective, and the English participle in *ing* must often be rendered by the infinitive; thus: *det er neppe værd at se*, it is scarcely worth (to see) seeing. Prepositions sometimes must be translated by other words; thus: *i*, in; *i Gaar Aftes* (in yester eve's), last evening; *i Morges*, this morning; *i Aar*, this year; *i Morgen*, to-morrow, &c. They are also written as adverbs: *igaar*, yesterday, *igaar-aftes*, last night, &c. *Paa*, on, upon: *paa Søndag*, next Sunday. *Ad*, to, up, of: *ad Aare*, next year. *Om*, for, about: *5 Rigsbankdaler om Maanedens*, \$5 a month, &c. We subjoin a specimen of Danish construction:

En Ulv,	den	dummeste	af	sin	Slægt,	traf
A wolf,	the	silliest	of	his	kind,	met
engang	en	Hund	udenfor	Skoven.	Ulv	en
one time	a	dog	outside	wood.	Wolf	one
vilde	til	at	slæbe	denne	bort,	da
would	about	to	carry	this	one	away,
forestillede	ham	at	den	var	altfor	mager.
presented	to	him	to	he	be	too
					lean.	

For a thorough study of the Danish language the following works may be consulted: Peder Syv, *Simbriske Sprog* (1663), the Cimbric being the basis of the Danish orthography; E. Pontoppidan, *Grammatica Danica* (1668); Otho Sperling, *De Danicæ Lingvæ Antiqua Gloria* (1694); J. Baden, *Roma Danica, sive Harmonia Lingvæ Danicæ cum Latina* (1699); J. H. Schlegel on the advantages and defects of the Danish language (in Danish, 1763); Rask's grammar for Englishmen (1830 and 1846); Fradersdorff's "Practical Introduction to Danish" (London, 1860). Dictionaries: H. van Alphen, "Royal Dictionary" (in Danish, 1764-'72), and *Dictionnaire français-danois et danois-français* (3 vols., 1772-'6); *Dansk Ordboek* ("Danish Wordbook"), under the direction of the society of sciences, by Möller, Viborg, Thorlachus, Müller, &c. (5 vols., 1793-1825); Björn Halderson's lexicon, Icelandic,

Latin, and Danish, edited by Rask in 1814, and Danish-English, by Ferral, in 1845-'54; Hornbeck's "Danish-English and English-Danish Dictionary" (2 vols., Copenhagen, 1863).—The literature of Denmark is for the most part of recent growth. Mediæval Danish writings belong to the general literature of Scandinavia. The most important of them are the codes of the ancient kings, which belong to the 12th century, and the songs and ballads, partly derived from the Scandinavian sagas, which have been preserved by being sung by the people. The Faroe islanders still sing them, and dance to their accompaniment. The historian Saxo Grammaticus (died about 1204) wrote in Latin. He was one of the first scholars of his time, and his *Historia Danica* has been thought worthy of a modern translation into Danish and of much scholarly comment. During the union of Denmark, Sweden, and Norway under one government, from 1397 to 1523, there was not much literary progress. Learning was confined to the clergy, who wrote mostly in Latin and on scholastic themes. Even the poems and dramas of the time were scholastic or mystical allegories. The general revival of letters, however, at the time of the reformation was felt in Denmark. Pedersen's translation of the New Testament and the Psalms was incorporated into the official translation of the whole Bible made in 1550, and its influence upon the national language and literature can hardly be overestimated. Pedersen also wrote some popular histories which were widely read. Unhappily the majority of writers in the 16th and 17th centuries were confined to dogmatic and ecclesiastical discussions, and the government, having adopted the Lutheran faith, persecuted any deviation from it; yet the eminent names of Tycho Brahe, the great astronomer, and Thomas Bartholin, the first anatomist of his day, with a number of others, including Christian Longomontanus and Ole Römer, placed Denmark in the first rank of scientific progress. In this period there were also several students of earlier Scandinavian history, Arent Berndtsen (died in 1680) being the most eminent of them, whose writings are of great value to the modern student; while the collection of the early popular songs, especially the work of A. S. Vedel (1591), gave a strong impulse to national poetry. It is said that Sophia, queen of Frederick II., when on a visit to Tycho Brahe, was detained several days by stormy weather; the astronomer beguiled the time by reading to her from Vedel's collection, and the queen was so delighted with the work that she provided for its publication. Vedel was followed a century later, and his collection enlarged, by Peder Syv. The 17th century also produced some original poets, three of whom should be named: Anders Arreboe (1587-1637), whose *Hexameron* describes the six days of creation; Anders Bording (1619-1677), who by royal privilege edited the "Danish Mercury," a political sheet published

monthly, and written throughout in verse; and Thomas Kingo (1634-1723), the author of many excellent hymns. Arreboe is called the father of Danish poetry. The poets and prose writers of the 16th and 17th centuries are enumerated by Thura in his *Idea Historiæ Literariæ Danorum* (1732). The classic mythology never pervaded the literature of Denmark, as it did that of other European countries; and hence the modern development of Danish poetry has a strongly Scandinavian character, the poets drawing their inspirations less from Greece and Rome than from the Scandinavian sagas, brought out by the labors of Vedel and his successors. The chief Danish writer of the 18th century is Ludvig Holberg (1684-1754), dramatic poet, writer of fiction, and popular philosopher, whose fertile imagination and genial humor manifest themselves with a strong bracing realism. He was most at home in comedy. He founded the theatre at Copenhagen, and wrote for it within three years 20 plays, several of which still continue to be favorites. The most popular are: "The Pewter Statesman," a political satire; "The Arabian Powder," a satire upon the alchemists; "Ulysses," a parody of the heroic German drama; and "The Brothers Antipodes," representing two brothers, one superstitious and the other skeptical, both undergoing a spiritual cure. Holberg has been called the Molière of the North. His most heroic epic, "Peder Paars," in which the hero is a country grocer, shipwrecked while crossing to Jutland to meet his lady love, is full of humor and genial philosophy. He wrote a prose satirical romance entitled "Niels Klim's Subterranean Journey," of supposed skeptical tendencies, which from fear of the orthodoxy of King Christian VI. was first published in Latin (1741), but was subsequently translated into almost every European tongue. His "History of Denmark to the year 1670," also written in Latin, is a standard work. Christian Falster was a contemporary of Holberg, and wrote some satirical poems of reputation, but of unequal merit. The next poet of the first order is Johannes Evald (died 1781). His tragedies of "Baldur's Death" and "Rolf Krage" have long been favorites, as well as his comedy "The Harlequin Patriot," while he is the author of the Danish national song "King Christian at the high mast stands." Evald holds toward Holberg somewhat the same relation as Schiller to Goethe, and both their names are representative of the early, enthusiastic, and successful effort to establish a national literature free from foreign corruption. They were followed by Christian Pram, a poet of considerable merit, whose romantic epic *Størkødder* appeared in 1785; and Ole Johan Samsøe (died 1796), and Levin Christian Sander (died 1819), writers of excellent tragedies, who coöperated in the development of a purely national literature; while the Danish histories of Peder F. Suhm and Erik Pontoppidan stand

prominent toward the close of the century. Jens Baggesen (1764-1826) was the favorite lyricist of the nation. His tales, lyrics, and comic epics are full of grace and humor. He was an admirer of the German poets, and wrote and published a number of pieces in German. He may perhaps be considered as marking that inclination toward German associations which comes out more conspicuously in Adam Oehlenschläger (1779-1850), the greatest Danish poet of the present century. Oehlenschläger found his favorite subjects in the mythology of Scandinavia, and his "Baldur the Good" and "Gods of the North" bring the gods of the Edda and the old Norse heroes upon the modern stage. His "Correggio" is an exquisite picture of the representatives of different schools of painting, and became a favorite of the European stage. The "Death of Socrates" and "Queen Margaret" show rich fancy, tender pathos, and noble diction. His "Hamlet" gives not the Shakespearian but the historic character as handed down by Saxo Grammaticus; its first representation in Copenhagen (1846) excited the greatest enthusiasm. Oehlenschläger translated his own works into German, and is as well known in Germany as in Denmark. Peder Andreas Heiberg (1758-1841) was a dramatic writer of great originality. His son Johan Ludvig Heiberg (1791-1860) confined himself to comedy and vaudeville, but ranks among the first of recent dramatists. He was also a philosophical and archaeological writer of great merit, and his novels, published anonymously, are little if at all inferior to those of Hans Christian Andersen. Bernhard Severin Ingemann (1789-1862) was a poet and dramatist known outside of Denmark. His epics *Waldemar de Store* and *Holger Danske* deserve great praise. He is the author also of the national song *Danebrog*. Hendrik Hertz (1798-1870) is also known outside of his native land, and some of his lyrics and dramatic poems have been translated into English. Fr. Paludan-Müller (born 1809) is also eminent; his *Adam Homo*, which may be classed with epic, didactic, or satiric poetry, is perhaps the most remarkable production of modern Danish literature. Nicolai Frederik Severin Grundtvig (1783-1872) is in many respects one of the first Danish authors of recent times. As a popular writer of hymns he is unequalled; in lyrical and historical poetry he equals Oehlenschläger, his *Kong Harald og Ansgar* and *Optrin af Kæmpelivets Undergang i Nord* being beautiful delineations of the old Danish life and character; while his archaeological writings and his translations of the works of Snorro and Saxo are of great value. His son Svend Grundtvig (born 1824) has published investigations of the literary monuments of Iceland. Christian Molbech (1783-1857) gained great distinction in Danish literary history. In 1826 he edited Harpestreng's "Book of Medicine," supposed to have been written in the 13th century. His son Chr. Karl Frederik Molbech

(born 1821), besides being well known as a student of Norse and Danish literary history, is a distinguished lyric poet. Rasmus Christian Rask (1787-1832) is one of the greatest philologists of the present century. He also wrote on the antiquities of Iceland and on the age and antiquity of the Zendavesta, besides publishing an edition of the Edda. Among scientific writers who have contributed to the world's progress, mention should be made of Heinrich Christian Schumacher, the astronomer (1780-1850), and J. F. Schouw, the physicist and geographer (died 1852). Hans Christian Oersted (1777-1851) has a world-wide reputation as the discoverer of electro-magnetism. His best known work, *Aanden i Naturen* ("The Soul in Nature"), has been translated into all European languages. His brother, Anders Sandøe Oersted (1778-1860), is known as a writer on jurisprudence and diplomacy.—In Denmark, as in other lands, the novel takes a foremost place in the literature of the present day. The most celebrated Danish novelist of our time is Hans Christian Andersen (born 1805). His best works, however, are his short fairy tales. His imagination and humor place these among the most charming of writings, and they are translated into all European tongues. His novels are less successful, though not without merit. He has also written lyrical pieces and dramas. Other modern novelists are Steen Steensen Blicher (died 1848), who describes the customs and characteristics of the Jutland people with much beauty; Waldemar Adolf Thisted, better known under the pseudonyme of Emanuel St. Herimid (born 1815); and Wilhelm Bergsøe (born 1835), whose *Fra Piazza del Popolo*, published in 1866, has given him a high reputation, and whose works are promptly reproduced in other languages.—The principal works not already mentioned on the history of Danish literature are Kraft and Nyerup's *Almindeligt Literatur-Lexicon* (3 vols., 1774-'84); Erslew's *Almindeligt Forfatter Lexicon* (5 vols., 1841-'60); Overskou's *Den danske Skueplads i dens Historie* (4 vols., 1859-'62); and *Bibliotheca Danica*, a systematic catalogue of Danish literature from 1482, the date of the first printed book, to 1830, including Icelandic and Norwegian books (Copenhagen, 1870).

DENNER, Balthasar, a German portrait painter, born in Hamburg in 1685, died there, April 14, 1747. He was employed by Frederick the Great and other German princes, and was invited by George I. to England, where he met with little encouragement. His chief merit consists in the mechanical finish of his pictures, some of which require to be examined with a magnifying glass in order that the labors of the artist may be appreciated. In his head of an old woman in the gallery of Vienna the down on the cheeks and the pores of the skin are represented with scrupulous exactness. This picture was purchased by the emperor Charles VI. for 4,700 imperial florins, and the

artist was commissioned to furnish a companion piece of an old man, which is not less carefully finished. His pictures were in great request in his day and brought very high prices.

DENNIE, Joseph, an American author and journalist, born in Boston, Aug. 30, 1768, died in Philadelphia, Jan. 7, 1812. He graduated at Harvard college in 1790, and studied law at Charlestown, N. H., where he was admitted to the bar. He read the Episcopal service to members of that communion at Claremont, and was urged to enter holy orders, with the promise of a settlement. In 1795, having acquired some reputation by literary contributions to various newspapers, under the title of "The Farrago," he became connected with a weekly journal published in Boston, called the "Tablet." This publication survived but three months, and in the summer of 1795 Dennie removed to Walpole, N. H., and became editor of the "Farmer's Weekly Museum," which attained extensive popularity under his management. His most notable contributions were a series of essays entitled "The Lay Preacher." The articles were discursive and lively, were widely copied by the newspapers of the Union, and gave their author a high reputation as a graceful and humorous essayist. The publisher became bankrupt in 1798, and Dennie was induced to become a candidate for congress, but was defeated. In 1799 he went to Philadelphia to fill the position of confidential secretary to Timothy Pickering, then secretary of state. He remained in this office but a few months, and after editing for a short time the "United States Gazette," on Jan. 1, 1801, he commenced, in conjunction with Asbury Dickens, the publication in Philadelphia of the "Port Folio," originally a weekly, but subsequently a monthly journal, in which he adopted the editorial cognomen of "Oliver Old-school." The "Port Folio" was the vehicle of frequent communications from John Quincy Adams (whose letters from Silesia were originally published in it), Horace Binney, Judge Hopkinson, Robert Walsh, Charles Brockden Brown, and other literary men, and maintained for many years a high reputation. He continued to be connected with the "Port Folio" until his death, and was highly esteemed for his social qualities as well as for his literary abilities. He was the originator of the "Tuesday Club."

DENNIS, a town of Barnstable co., Mass., on Cape Cod, about 65 m. S. E. of Boston; pop. in 1870, 3,269. It extends entirely across the peninsula, here 8 m. wide, and is separated from Yarmouth by Bass river. It contains a number of churches and schools. Most of the inhabitants are engaged in commerce, ship building, and fishing. About 50 vessels are annually employed in cod and mackerel fishing, and 80 or 90 in the coasting trade. The Cape Cod railroad passes through the town.

DENNIS, John, an English writer, born in London in 1657, died Jan. 6, 1734. He was the

son of a saddler, but was sent to Harrow school and Cambridge university, where he remained eight years, taking his degree of A. M. in 1683. After travelling some time on the continent he returned, a whig in politics, and mingled with the politicians and literary men of London. Among his friends were Dryden, Halifax, Wycherley, and Congreve. By his expensive habits he soon dissipated a small fortune which had been left him, and the duke of Marlborough obtained for him an appointment in the customs worth £120 a year; but he was compelled to sell this to satisfy pressing demands, only reserving a small annuity for a term of years. Having outlived this term, he was reduced to great poverty, became blind, and was compelled in the latter part of his life to depend upon the charity of literary friends, many of whom he had grossly calumniated. He wrote some verses of little merit, and several plays which obtained a transient popularity, especially the one entitled "Liberty Asserted," in which the French, with whom the English were then at war, were roughly handled. Of his essays the best are "The Grounds of Criticism" and those on Addison's "Cato" and Pope's "Rape of the Lock," though the two latter are characterized by the bitterness with which he usually spoke of his contemporaries. He attacked Swift, Pope, Addison, Steele, and nearly all the prominent writers of the day, thereby making enemies of those best able to castigate him. This was done most effectually by Swift and Pope, the latter devoting to him some of the sharpest hits in the "Dunciad." He had a most exaggerated idea of his own importance, and desired to have a clause in the treaty of Utrecht protecting him from the wrath of the French king, which he imagined had been aroused by his play, "Liberty Asserted." He had invented a new way of imitating thunder for his play of "Appius and Virginia," which was brought out and failed in 1708. Shortly afterward, during the performance of "Macbeth," hearing the thunder produced by his apparatus, he rose in the pit and denounced the managers for stealing his thunder. His fame is due mainly to the abuse which he received from those he had assailed.

DENON, Dominique Vivant, a French archæologist, born at Châlon-sur-Saône, Jan. 4, 1747, died in Paris, April 27, 1825. He was sent to Paris to study law, but devoted his time chiefly to art and literature. He gained favor at the court of Louis XV., was employed on several embassies, and after the death of that king was for a time minister to Switzerland. Going subsequently to Naples in the suite of the ambassador, he spent several years in Italy, studying the monuments of ancient art, forming collections of remarkable specimens, and making copies of others. Here also he studied etching and mezzotint engraving. He engaged with the abbé de Saint-Non to superintend the preparation of a *Voyage pittoresque de Naples et Sicile*; but

having a dispute with him, he brought out the work independently. The portion relating to continental Italy appeared in the notes to a French translation of the journey of Swinburne, and that relating to Sicily and Malta in a separate volume. Having returned to Paris during the revolution (after a second stay in Italy), he met Bonaparte at the house of Mme. de Beauharnais, and was chosen by him to accompany the expedition to Egypt in the capacity both of a savant and artist. In 1802 appeared his *Voyage dans la basse et la haute Égypte*, profusely illustrated by his own hand. It was first published in two large folio volumes, but there are several editions of smaller size. He also took the chief part in the preparation of the *Description de l'Égypte*, under the auspices of the Egyptian institute, of which he was a member. Bonaparte made him inspector general of the museums of France, and he accompanied the army in the various campaigns of the emperor, selecting the works of art which were gathered to enrich the galleries of the Louvre. On the second restoration he retired to private life, and spent some years in collecting and arranging the material for a history of art, which was finished by Amaury Duval (*Monuments des arts du dessin chez les peuples tant anciens que modernes*, 4 vols. fol., 1829). Denon's own etchings number more than 300.

DENT, a S. E. county of Missouri; area, about 750 sq. m.; pop. in 1870, 6,357, of whom 81 were colored. The soil is fertile and the surface much diversified. Current river and several smaller streams have their sources here. The chief productions in 1870 were 55,024 bushels of wheat, 215,693 of Indian corn, 53,042 of oats, 16,539 of potatoes, 988 tons of hay, 58,588 lbs. of butter, and 26,770 of tobacco. There were 1,241 horses, 1,547 milch cows, 3,426 other cattle, 6,861 sheep, and 11,230 swine. Capital, Salem.

DENTALIUM, or **Tooth Shell**, a gasteropod mollusk, usually placed near the limpets. The shell is tubular, symmetrical, curved like a long slender tooth, open at each end, attenuated posteriorly; the surface is either smooth or longitudinally striated; aperture circular. The animal is attached to the shell near the posterior anal surface; head rudimentary, without eyes, with teeth in mouth at the base of a long, conical foot; there are two symmetrical branchia; sexes believed to be united. In the early stages they have wing-like expansions at the anterior part of the body, and many tentacles around the head. They are animal feeders, devouring minute bivalves and foraminifera; they are all marine, living in almost all seas, on sandy and muddy bottoms, in which they often bury themselves; they are found in from 10 to 100 fathoms. There are about 50 living and 125 fossil species, ranging from the Devonian forward. They were classed by the early zoölogists with the worms, and even Cuvier placed them near

serpula among the annelids, noticing, however, certain characters recalling the molluscan structure. This shell has recently been brought into notice by Prof. E. S. Morse, who

1. Shell of *Dentalium entalis*. 2. Shell magnified and fractured, showing animal contracted. 3. Animal at the moment of advancing from the shell. 4. Animal magnified, abdominal aspect. 5. Animal magnified and cut open, showing internal formation. 6. Animal magnified, dorsal aspect.

has found in it many different characters interesting from a Darwinian point of view, and suggesting the development of the branch of mollusks from *dentalium* or some animal resembling it, which had been derived from some annelid form. *Dentalium*, according to him, points to the acephala in the absence of a head, to the gasteropods by the lingual teeth, to the pteropods by the wing-like expansions, and to the cephalopods by the many tentacles of the embryo. Whether these indicate derivation or not, the union of annelid peculiarities with those of all the classes of mollusks is certainly unusual and interesting. The common species of the Atlantic, the *D. entalis* (Linn.), is about $1\frac{1}{2}$ inch long and $\frac{1}{4}$ inch in diameter at the anterior end, tapering to a dull point.

DENTATUS, Manius (or Marcus) Curius, a Roman consul, flourished in the first half of the 3d century B. C. In 290 he became consul and defeated the Samnites; in 275, during his second consulship, he vanquished Pyrrhus in two great battles; in 274 he was elected consul a third time, and was victorious over the Samnites, Lucanians, and Bruttians. On the conclusion of his third consulship he retired to a small farm in the Sabine territory, and cultivated it with his own hands. While he was thus engaged, the Samnites sent an embassy to him with costly presents. They found him sitting at the hearth cooking vegetables for his dinner. He rejected their gifts, telling them he would rather rule over those who possessed wealth than possess it himself. In 272 he was made censor, in which capacity he constructed an aqueduct from the Anio (Teverone) into the city, and by a canal he carried off the water of the lake Velinus (Velino) to the Nar (Nera), and thus gave to the Reateans a large tract of excellent land. He is said to have been born with teeth; hence his surname of *Dentatus*.

DENTISTRY (Lat. *dens*, tooth), the surgical treatment of the teeth, and the manufacture and fitting of artificial teeth. Although it is

only within less than a century that dentistry has taken the rank of a distinct profession, attention was directed from the earliest periods to the means of preserving and improving the beauty of the teeth. In the time of Herodotus dentistry appears to have been practised in Egypt as a distinct branch of surgery, as was also the treatment of the diseases of the eye and of the ear. Little, however, is known of the attainments of these early practitioners. In the ancient tombs of this people artificial teeth of ivory or wood were found by Belzoni and others, some of which were fastened upon gold plates. It is also stated that teeth of the mummies have been found filled with gold. Thus it would seem that the ancient Egyptians understood processes of the art which are commonly regarded only as inventions of modern times. Artificial teeth are alluded to by several of the Greek and Latin poets, as Ovid, Martial, and Horace. The works of Galen, written in the 2d century, contain the earliest treatises upon this subject, and they continued to be the best until the works of Fallopius, Eustachius, and Ambroise Paré appeared in the 16th century. During the 18th century the attention of many medical men in France and England was directed to the subject, and a number of elaborate works were published devoted exclusively to the art of dentistry. These, and prominently among them the treatise of John Hunter (1771-'8), laid the foundation of the English school of dentistry. The subject, however, was treated anatomically and philosophically rather than practically; and the same may be said of the writings of the eminent French surgeon of this period, Bichat. Neither of these was a practical dentist, and the subsequent publications of Dr. Blake in 1798, and of Fox in 1803 and 1806, as of others at later dates, served rather to elucidate the physiology of the teeth and the nature of the diseases to which they are subject than the method of treating them. From advertisements in the newspapers of 1803 the practice of making teeth and cleaning them appears to have been in the hands of silversmiths or jewellers. In 1826 the "Principles of Dental Surgery," by Leonard Koecker, M. D., who had practised dentistry from 1807 to 1822 in Baltimore and Philadelphia, appeared in London, and fully established the claims of the art to take rank as a distinct branch of science. From that time new treatises have continued frequently to appear. The progress of the French school was very rapid in the early part of the present century. Prof. Baumes's treatise on first dentition and the diseases that accompany it appeared in 1805, and about the same time a work on the theory and practice of the art by Laforgue. A number of works were published by Delabarre between 1815 and 1826 on different subjects relating to the teeth and their treatment. Among them is a treatise on "Mechanical Dentistry," published in 1820, and illustrated with 42 plates.

It was during this period, when publications upon dentistry were frequently appearing in France, that the manufacture of artificial teeth of porcelain was introduced; and in 1821 a work upon this subject was published by Audibran, entitled *Essai historique et pratique sur les dents artificielles incorruptibles*. By this it appears that Fauchard in 1728 proposed their manufacture; and that in 1776 Duchateau, a chemist of St. Germain-en-Laye, attempted to produce them, and finally succeeded with the aid of Dubois, a dentist of note in Paris. The latter imitated the colors of the natural teeth and gums by the use of mineral oxides, and obtained royal letters patent for the invention. Dentistry was introduced into the United States by Le Mair, of the French forces which joined our army during the revolutionary war. An Englishman named Whitlock also commenced the practice soon after the arrival of Le Mair. About 1788 John Greenwood established himself in New York, the first American of this profession. In 1790, and again in 1795, he carved in ivory an entire set of teeth for Gen. Washington. They were secured by spiral springs, and the neatness and ingenuity of the work was considered equal to any executed at that period abroad. Other dentists soon appeared in New York, Philadelphia, and Baltimore. Their work included the extracting of teeth, filing and cleaning them, and replacing the natural teeth when lost with artificial ones, commonly made of ivory. Dr. Hudson, formerly of Dublin, who had settled in Philadelphia, first directed his attention particularly to the cure of the diseases of the teeth, and to arresting the progress of dental caries. In 1820 the number of practitioners in the United States was probably little more than 100. Ten years afterward there were about 300, of whom probably not more than one sixth were well instructed. But the increase in their numbers was afterward very rapid. In 1842 they were believed to number about 1,400, and in 1872 about 5,000. An important event in the history of dental surgery in this country was the establishment of the "American Journal and Library of Dental Science" in Baltimore, in 1839. The society of dental surgeons was soon after formed, and at its second annual meeting the "Journal" was made the property and organ of the association. Maryland founded by its legislature, a few months previous to the organization of the society above named, a college of dental surgery, with four professorships, designed for instruction in the principles and mechanical practice of the art. Two years afterward another society of dentists, like that of Baltimore, was organized at Richmond, Va., and in August, 1844, a third was formed at Cincinnati, Ohio, styled the "Mississippi Valley Association of Dental Surgeons." A college of dentistry has also been established in Philadelphia and another in Cincinnati, and state and local dental societies in various parts of

the country. In August, 1855, the national convention of dentists was organized through the active exertions of Dr. Elisha Townsend of Philadelphia, and its first annual meeting was held in that city. Dr. John B. Rich of New York was its first president. Besides the reports of these societies, which have disseminated a knowledge of the discoveries and improvements made in the science, many very valuable works of a practical nature have been published by American authors.—The means of preventing the diseases to which the teeth are subject, is a branch of dental science quite as important as that relating to the arrest and cure of these diseases. These means consist, first, in giving what assistance nature requires to bring the teeth of second dentition into a regular arrangement; and secondly, in the care of the individual himself in preserving the teeth uniformly clean. As the temporary or first set of teeth drop out, which as a general rule they should be allowed to do, by their roots being absorbed, the second set already formed succeed and take their places. Of the temporary teeth there are but 20, and these are of small size. The teeth of the second dentition are 32 in number, with one or two exceptions are of larger size than their predecessors, and consequently occupy a greater space. Yet these, appearing one by one, take their places, and should occupy in the harmonious process of the growth of all the parts the same room apparently that was filled by the 20 deciduous teeth. This is accomplished by the elongation forward of the jaw, the arch gradually assuming the form of a semi-ellipse in place of that of a semi-circle. Teeth irregularly arranged, interfering with each other, or as in some cases with the lips, or pointing inward so as to be removed from the healthy action of mastication, or twisted in their sockets, are not only disfiguring, but are particularly liable to disease and decay. From their first appearance to the age of 16 of the individual, they may be treated by various mechanical applications attached to the other teeth and bearing suitably upon those to be brought into place, so that without violence the work of nature is gently assisted, and a perfect set is gradually formed. It is the opinion of dentists that when the teeth are kept perfectly clean they will not be affected by caries. As the secretions of the mouth are, however, liable to be vitiated by constitutional disorders, the keeping them clean requires great vigilance. When caries occurs it should be immediately removed by the use of the file. The surface of the bone from which the enamel is removed should be left smooth and polished, and if proper care be afterward taken in keeping it clean, the disease may not return. If the decay has extended into the bony substance of the tooth, the filing is then only preparatory to the complete removal of the diseased portion by excavating with suitable instruments, and filling the cavity with some proper material. Much

attention was formerly given to shaping the cavity, in order that by its contracted aperture the filling should be held in as by dovetailing; but by the use of gold foil and sponge gold specially prepared for this purpose, it is now found practicable to apply the metal in successive portions, and build up a solid block of any shape by incorporating each portion with that which preceded it. This is done by carefully packing it with suitable instruments, and the gold may be thus rendered so compact, it is affirmed, that its specific gravity shall equal that of the cast metal. In wide-mouthed cavities the filling is secured by being built upon plugging carefully introduced into the cavities of the roots, and also by lateral pins of the gold filling made to enter from this into little holes or grooves drilled for the purpose into the walls of the tooth. It has been generally considered impracticable to preserve a tooth when the decay has reached into the internal or pulp cavity. In this condition inflammation often takes place at the root, and matter collects, forming an ulcer between the periosteum of the tooth and the bone. If the discharge of this be stopped by filling the cavity, the matter will find its way through the gum, causing a gum boil near the root; or it produces inflammation of the face, often attended with great suffering, which is relieved only by the removal of the tooth. The modern treatment is to perforate the sac at the root by a fine drill passed through the cavity; and if the pulp be sensitive, it is cut out and removed by a delicate steel wire furnished with a hook at the end, so small that it can pass freely into the nerve cavity. A solution of creosote or carbolic acid is then injected into the cavity, and as soon as a healthy action has taken place the tooth may be safely filled, with the liability of further trouble from the same cause greatly reduced.—The only unobjectionable material for filling teeth is gold foil or the sponge gold specially prepared for this purpose. The latter material is produced by dissolving gold free from copper in nitro-hydrochloric acid, placing the solution in a flat-bottomed vessel, and heating and precipitating by strong solution of oxalic acid. In a few hours the gold is wholly deposited, and the supernatant liquid may be decanted off, taking care not to disturb the gold at the bottom. The vessel is then several times filled with boiling water and decanted, until the last washings contain no more oxalic acid. The gold is now carefully slipped upon a piece of filtering paper, and by means of a spatula gently pressed into the form of the desired cake, but a little thicker. It is then removed to a porcelain crucible, and heated for a short time, somewhat below a red heat, when it shrinks and becomes coherent. Tin foil may be used, and its malleability and cheapness well adapt it for large and badly shaped cavities and for temporary fillings in sensitive teeth; but it is liable to oxidize and produce discoloration. Temporary fillings, for the

purpose of protecting the cavity while it is being prepared for gold filling, are often made of gutta percha. A preparation of it known as Hill's stopping, made by incorporating with it a powder made of quicklime, quartz, and feldspar, is highly recommended. When this composition is used a condensing instrument large enough to cover the filling should be held upon it until the nerve becomes cool. A mixture of chloride and oxide of zinc, called oxychloride of zinc, or *os artificiel*, has lately been much used as a temporary filling, and also for pulp cavities. Exposed nerves have also been covered with it, and gold used to complete the filling. The operations for filling teeth are varied and complicated. Many ingenious machines have been lately introduced for preparing cavities and condensing the filling. Drills worked by treadles, and also by galvanism as a motor force, and automatic mallets have been successfully applied.—The extraction of the teeth is an important branch of dental practice; safe and easy with good instruments in skilful hands, but, as practised by the unprofessional operator, not a little hazardous. The improved instruments of modern times, however, have greatly lessened this risk, and pain is avoided by the use of anæsthetic agents.—The last department of dentistry to be noticed is the construction and application of artificial teeth. These were formerly carved from ivory of the tusk of the elephant or the tooth of the hippopotamus. They were obtained also by altering the shape of the teeth of some of the inferior animals; and the crowns of human teeth were often conveniently engrafted upon the roots of the original front teeth. All these materials are objectionable from their susceptibility to the action of the fluids of the mouth; ivory soon becomes offensive from being saturated with these fluids; and all of them are liable to decay, inducing at the same time disease in the sound teeth remaining. Porcelain teeth perfectly resist the corrosive action of the fluids of the mouth, and imitate so perfectly in color and animated appearance the natural teeth, that they are often not easily distinguished from them. Various methods of securing artificial teeth in their places have been in use. So long ago as 400 years B. C. they were fastened by ligatures of flax or silk, and with wire of gold or silver, to the natural teeth that remained. In modern times metallic clasps, spiral springs, and fastenings of gutta percha and of caoutchouc have been used for this purpose; but the most perfect method is to secure the teeth, either in whole or partial sets, to a plate of gold or other metal, which is so accurately fitted to the gums that it is firmly retained by atmospheric pressure. In making an artificial set of teeth, the first object is to obtain in some hard metal an exact model of the mouth in which the plate is to be fitted. For this purpose, yellow or white wax, free from mixture of grease, and softened by warm water, is placed in a shal-

low vessel, which may be introduced into the mouth. Plaster of Paris made into paste may be substituted for the wax. The contents of the cup are firmly pressed around the gums, and, if for the upper jaw, are made to cover the roof of the mouth as well. An experienced operator thus obtains in a few minutes an exact mould of the parts to which the material is applied. The teeth, if any are present, leave their forms faithfully impressed in their true positions, and the cavities between are represented by corresponding projections in the wax or hardened plaster. The impression removed from the mouth serves to furnish a model of the jaw, which may be taken in plaster of Paris also. This is used as a pattern in moulding sand, and a cast is then obtained in any metal, as for instance zinc; and by pouring melted lead upon the zinc, which is turned over upon its face and surrounded with a brass or iron collar for retaining the lead, a mould in this metal is obtained precisely like the original one in wax. By means of the zinc cast and lead mould, the exact shape of the parts is transferred to the sheet of gold or other metal, this being placed between the two, and made, by hammering and swaging, to assume all their irregularities of surface. The fit is the more readily made if the teeth have been cut off from the plaster model before making the metallic casts. A duplicate plaster cast serves to give the position of those teeth to which the plate is to be finally fitted.—A variety of materials have been experimented upon, in which to securely imbed the bases of the teeth. Gutta percha has been used to contain them; but its texture and strength were in a short time destroyed by the action of the fluids of the mouth. It was then applied vulcanized or mixed with sulphur; and caoutchouc is employed in the same way. These prove to be important auxiliaries in mechanical dentistry, especially for temporary sets of teeth. They do not, however, readily take the colors which may be applied to more suitable substances. In 1851 the process called continuous gum was invented by Dr. John Allen, professor in the Ohio college of dental surgery. In this a silicious compound, similar in composition to that of which the teeth are made, but more fusible, is applied in the form of a paste over the fastenings at the back of the teeth, and also in the front, so as entirely to bury the ends of the teeth, as the natural ones are buried in the gums. To withstand the high degree of heat requisite for baking this upon the plate, platinum is substituted for gold. Platinum has besides the advantage of forming at a high heat a close union with the silicious compound, which is spread over the lingual side of the plate as well as over the bases of the teeth. When thoroughly dry, the work is baked at a white heat in the muffle of an assaying furnace. A new application of the paste is then made to fill all the crevices caused by shrinking, and upon this coating are made numerous ridges

and depressions with the spatula, which, when afterward covered with the coloring enamel, cause this to assume different shades of the color, and present the appearance of the natural gums. The baking is repeated, and after this the coating of coloring matter, called the gum enamel, is applied, when a third baking completes the process, by which a proper degree of hardness and a natural color are produced. The compositions used are empirical mixtures of pure silica and feldspar, with a suitable flux to produce a fusible compound, possessing sufficient strength, hardness, and permanency of character. The work can easily be repaired when broken, or alterations made when required by changes in the mouth, by building upon it more of the paste and again baking; in this way even the length of the artificial teeth can be increased and new ones introduced. In the same way the artificial processes called cheek restorers were applied by Dr. Allen, which are projecting portions built upon the artificial gums far back in the mouth, and serve to distend the cheeks when these are fallen in. The mechanical operations connected with the work have led to increased knowledge in the use of plastic compounds, and introduced improved methods of treating the metals employed.

DENTITION. In all the higher animals the teeth are developed directly from the mucous membrane, and are therefore, like hair, nails, feathers, &c., appendages of the skin, and form no part of the true osseous system. As early as the fifth week of foetal life, according to the observations of Prof. Goodsir, a deep, narrow groove between the lip and the rudimentary palate in the upper jaw indicates the future situation of the teeth. Within the next three weeks papillæ developed at the bottom of the groove become the germs of the future milk or temporary teeth. In the progress of development the papillæ are enveloped in open follicles, and these again are converted into shut sacs; contemporaneously with these changes, the edges of the dental groove are themselves growing, so that by the 14th week they meet, enclosing the tooth sacs. Within the sacs the papillary pulp is gradually converted into dentine, of which the body of the tooth is composed, while the enamel is probably formed by calcification of the epithelium abundantly produced from the inner surface of the sacs. As teeth are required before the jaws have attained their growth, and yet from their structure are incapable of enlarging *pari passu* with the bones in which they are placed, provision is made for a temporary set, which when they have served their purpose are replaced by the permanent teeth. As early as the 14th week minute crescentic depressions of mucous membrane may be discovered above and at the inner part of the opercula of the milk teeth; these depressions soon become converted into minute compressed sacs, which gradually sink behind and below the sacs of the milk teeth, and

in these sacs are developed the first ten permanent teeth of each jaw; the other six are developed in sacs placed posterior to those of the last milk teeth, which are formed in a manner precisely similar to those of the milk teeth themselves. The ossification of the permanent teeth commences a little before birth with that of the first molar, and proceeds during the first three years of infancy successively in the incisors, the canines, and the bicuspsids. The approach of the time for the eruption of the temporary teeth is announced by an increased secretion of saliva. In the earlier months of infancy the mouth is comparatively dry, but as the teeth shoot into the gums the mouth becomes moist and the child begins to drive. The progress of dentition is not apparently continuous, but after the eruption of each successive pair a pause of one or two months generally follows. The central incisors commonly pierce the gum in the course of the 7th month after birth, those of the lower jaw preceding the upper ones by a short interval; between the 7th and 10th months the lateral incisors make their appearance; from the 12th to the 14th month the anterior molars, and between the 14th and 20th the canines are cut; and the first dentition is completed between the 18th and 36th months by the protrusion of the posterior molars. Both the time and the order of appearance of the first set of teeth admit of a good deal of variation, their progress being hastened or delayed sometimes six or seven months by a lateral incisor, or even a molar or canine tooth, cutting the gum before the appearance of the central incisors. The period of primary dentition is attended with increased risk to the life of the infant. During its continuance the proportionate mortality becomes much increased, and in the bills of mortality numerous deaths are ascribed to teething alone. It must be remembered, however, that at this time all the functions of the young being are in a state of great activity, and that teething is but one in a series of changes by which the infant is prepared to substitute for the milk provided by its mother, food suitable to the conditions of its future existence. In a healthy infant dentition in itself is attended with little inconvenience and no danger; when the teeth come to distend and stretch the mucous membrane lining the gums, there is probably a little tenderness and pain, some fretfulness, and perhaps slight febrile excitement; but in the absence of other causes of disease, this soon passes over. If, however, the nervous system is unduly excitable, dentition may seriously complicate other maladies. When the process of dentition is advancing normally, it should never be interfered with; when the gum is red, swollen, and painful, scarification may be resorted to with advantage, and may be repeated if necessary, the trifling loss of blood affording relief to the inflamed gum. When the tooth is evidently about to pierce the gum, if the child appears to suffer, it may be freed by cutting down to it

with the gum lancet. In cases where convulsions supervene suddenly without an evident cause, if dentition is proceeding actively and the gums are tense and swollen, the gum lancet may be resorted to. Occasionally dentition is attended with much fever and derangement of the digestive organs, while a sloughy unhealthy ulceration makes its appearance on the gum over the teeth just about to protrude, or at the edge of the gum of those which have recently been cut. In these cases the gum lancet does positive harm, while they readily yield to a properly regulated diet, and to the use of the chlorate of potash in solution; in doses of one or two grains repeated every four hours. During the earlier period of childhood a bony plate or partition separates the permanent from the fangs of the temporary teeth; as the period approaches in which the former are to replace the latter, this partition disappears, and the crown of the enlarged permanent tooth makes its way into the cavity of the temporary fang. As the permanent tooth advances, the fang of the milk tooth is absorbed, not however from any pressure exercised by the one upon the other, the two never coming in contact; and as the crown of the milk tooth falls off, the permanent tooth is ready to replace it. The first anterior or true molar usually appears at about 6½ years; about the same time or a few months later the central permanent incisors appear; the lateral ones are developed at 8, the anterior and posterior bicuspsids at 9 and 10, the canines from 11 to 12, the second true molars from 12 to 13, and the wisdom teeth from 17 to 19. From the investigations of Mr. Edwin Saunders ("The Teeth a Test of Age, considered with reference to the Factory Children"), it would appear that the second dentition furnishes the best physical evidence of the age of children within our reach; in the majority of instances he found its indications coincided closely with the real age of the children, and when they failed the extreme deviation was but a year.

DENTON, a N. E. county of Texas, drained by two forks of Trinity river, and occupied partly by prairies and partly by vast forests called the Cross Timbers; area 900 sq. m.; pop. in 1870, 7,251, of whom 500 were colored. The chief productions in 1870 were 18,216 bushels of wheat, 173,510 of Indian corn, 41,060 of oats, 11,826 of sweet potatoes, and 674 bales of cotton. There were 6,195 horses, 2,863 milch cows, 35,220 other cattle, 5,331 sheep, and 10,200 swine. Capital, Denton.

DENVER, a city of Arapahoe county, Colorado, the capital of the county and of the territory, situated on the right bank of the South Platte, at the junction of Cherry creek, 15 m. from the E. base of the Rocky mountains, and about 500 m. W. of the Missouri river, 5,267 ft. above the sea; pop. in 1870, 4,759; at the beginning of 1873 estimated by the secretary of the board of trade at

15,000. It occupies a series of plateaus rising by gentle ascents from the river, and faces the mountains, commanding a grand and beautiful view. It is built principally of brick, manufactured in the vicinity. Five railroads meet at this point, viz.: the Kansas Pacific, the Denver Pacific, the Colorado Central, the Boulder Valley, and the Denver and Rio Grande. Denver is the commercial centre of Colorado and the adjacent country, and its trade is important. The receipts of freight for 11 months ending Nov. 30, 1871, over the Denver Pacific and Kansas Pacific railroads, amounted to 62,551,690 lbs. For the same period of 1872 they were 88,539,710 lbs., of which 27,390,560 were agricultural, 5,091,640 animal, 5,138,550 forest, and 1,759,710 mining products, 8,456,060 manufactures, and 22,630,760 miscellaneous. The amount of freight shipped over these lines for the same period in 1871 was 7,031,842 lbs.; in 1872, 17,833,620 lbs., of which the principal items were as follows: grain, 1,220,560 lbs.; flour and meal, 284,720; cattle, 8,532,200; beef and pork, 232,790; hides and wool, 1,669,120; coal, 605,600; ore, 3,111,270 lbs. The arrivals of passengers in 1872 were 11,250; departures, 6,794. The shipments of coin and bullion by express during the year amounted to \$1,295,411, viz.: gold bullion, \$1,212,934; silver bullion, \$19,760; gold coin, \$62,717. The sales of merchandise in 1872 were in the aggregate \$13,039,000. The value of manufactures was \$1,394,000. The most important establishments are 6 breweries, 1 woollen mill, 3 flour mills, 1 iron foundry, 2 planing mills, 1 terra cotta foundry, several carriage factories, and a turning shop. The Denver smelting and refining works, in process of construction, will occupy a brick building 55 ft. wide by 200 ft. long, with capacity for 40 tons of ore a day. There are three national banks with an aggregate capital of \$400,000, and deposits, Dec. 27, 1872, amounting to \$1,215,570 65, and a savings bank. The branch of the United States mint is employed in the melting and assaying of bullion, which is returned to depositors in the form of bars with the weight and fineness stamped upon them. The aggregate deposits of domestic gold to June 30, 1873, were \$6,357,275 49 of which \$5,761,487 29 were from Colorado; the product was \$6,451,213 08 in gold bars, and \$19,879 43 in silver bars. The number of deposits of gold and silver in 1872 was 1,741, valued at \$1,007,529 45. The city is divided into four wards, and governed by a mayor and eight aldermen. It is supplied with water through 8 m. of pipe, and is lighted with gas. The value of taxable property in 1871 was \$6,772,908; at the close of 1872 it exceeded \$8,500,000. There are 31 hotels and a theatre. The following are the statistics of the public schools for the year ending Sept. 30, 1871: number of persons of school age (5 to 21), 1,162; number of schools, 3; teachers, 14; pupils en-

rolled, 982; average attendance, 413. There were 6 private schools, with an average attendance of 250. A public school building has recently been erected, at a cost of about \$70,000, which will accommodate 500 pupils. The territorial library contains more than 2,500 volumes. The newspapers and periodicals published here are 4 daily, 1 semi-weekly, 4 weekly, and 2 monthly. There are 8 churches, viz.: 1 Baptist, 1 Congregational, 1 Episcopal, 2 Methodist (1 colored), 2 Presbyterian, and 1 Roman Catholic.—The first cabin was erected on the site of Denver in 1858.

DEODAND (Lat. *Deo dandum*, a thing to be given to God). A superstitious practice prevailed in England from the earliest time until very recently, whereby a chattel which had been the immediate instrument or cause of death to a human being was forfeited to the king, to be applied by him to pious uses. *Omnia quæ movent ad mortem sunt Deo danda* (all things which are the moving cause of death are to be offered to God), is the rule stated by Bracton. It is supposed by Blackstone that the origin of this practice was the religious doctrine of making expiation for the souls of such as were carried off by sudden death. A singular distinction was made between an infant and an adult, viz.: that an infant falling from a cart or horse not in motion, there was no forfeiture; whereas in the case of an adult the horse or cart was a deodand. Yet if a horse or other animal should of his own motion kill either an infant or adult, or if a cart should run over him, in either case the animal or cart was forfeited as a deodand. Another rule equally inexplicable was, that when a thing not in motion was the occasion of a man's death, only that part which was the immediate cause was forfeited; but if the thing was in motion, then the whole was forfeited; as, if a man was run over by a cart wheel, the whole cart was a deodand. It made no difference although the owner of the chattel was not in fault. The law of deodand was not applied in cases of felonious homicides, and it is now abolished by statute 9 and 10 Victoria, c. 62.

D'EON, Chevalier. See Eox.

DE PEYSTER. I. **Johannes**, one of the early settlers of New Amsterdam (now New York), born in Haarlem, Holland, in the beginning of the 17th century, died in New York about 1685. He was of a French Huguenot family, filled several offices under the Dutch government in New Amsterdam, and was one of the last to take the oath of allegiance to the British crown. He was subsequently at different times alderman, deputy mayor, and mayor. At his death he was one of the richest citizens in the colony. II. **Abraham**, eldest son of the preceding, born in New York (then New Amsterdam), July 8, 1658, died there, Aug. 10, 1728. He was a merchant, and amassed considerable wealth. Between 1691 and 1695 he was mayor of New York, and subsequently became chief justice of the

province, and president of the king's council, in which latter capacity in 1701 he acted as colonial governor. He was also colonel of the forces of the city and county of New York, and treasurer of the provinces of New York and New Jersey. He was the intimate friend of William Penn, and of the colonial governor, the earl of Bellamont. The mansion erected by him in Pearl street in 1695, which was at one time the headquarters of General Washington, remained standing till 1856. **III. Arent Schuyler**, a loyalist officer, grandson of the preceding, born in New York, June 27, 1736, died at Dumfries, Scotland, in November, 1832. He entered the 8th or king's regiment of foot in 1755, served in various parts of North America under his uncle, Col. Peter Schuyler, and commanded at Detroit, Michilimackinac, and various places in Upper Canada, during the American revolutionary war. It was through his efforts that the Indians were allied with the British during the war. Having risen to the rank of colonel, and commanded his regiment for many years, he retired to Dumfries. He was on terms of friendship with Burns, who addressed to him one of his fugitive pieces, and with whom he once carried on a poetical controversy in the columns of the "Dumfries Journal." At his death he had held the king's commission upward of 77 years, and was probably at the time the oldest officer in the service. **IV. John Watts**, an American military and historical writer, born in New York, March 9, 1821. He was commissioned as brevet major general by the New York legislature, and has published "Life of Gen. Torstensen" (1855), "The Dutch at the North Pole and the Dutch in Maine" (1857), "Early Settlement of Acadia by the Dutch" (1858), "The Dutch Battle of the Baltic" (1858), "History of Carausius" (1858), "The Ancient, Medieval, and Modern Netherlanders" (1859), "Winter Campaigns the Test of Generalship" (1862), "Practical Strategy" (1863), "Secession in Switzerland and the United States compared" (1864), and "Decisive Conflicts of the late Civil War" (1868).

DEPOSITION, in law, the testimony of a witness reduced to writing in due form of law, taken by virtue of a commission or other authority of a competent tribunal. When taken by commission, depositions are usually in answer to questions upon the examination in chief, and upon cross-examination, prepared and submitted to the court from which the commission issues. In other cases they are taken by consent of counsel or in due course of law, the privilege of cross-examination being always preserved, except in some cases where depositions of matters within the knowledge of persons of great age are allowed to be taken for the purpose of perpetuating their testimony, and in cases where immediate death by violence is expected. This must, when possible, be sworn to and signed by the witness. In the United States, compulsory process is usually allowed to procure this evidence.—In ecclesias-

tical law, deposition is the act of depriving a clergyman by a competent tribunal of his clerical orders, in punishment of some offence, and to prevent his acting in his clerical character.

DEPPING, Georges Bernard, a miscellaneous writer, born at Münster in Westphalia, May 11, 1784, died in Paris, Sept. 5, 1853. He went to Paris in 1803, and during the rest of his life was engaged in writing books on a variety of subjects and preparing articles for various periodicals and cyclopædias. Among his works were two juvenile books which obtained great popularity, and were translated into several languages: *Les soirées d'hiver, ou entretiens d'un père avec ses enfants sur le génie, les mœurs et l'industrie des divers peuples de la terre* (2 vols., 3d ed., 1832), and *Merveilles et beautés de la nature en France* (2 vols., 1835). He assisted Malte-Brun in his geographical works, and wrote descriptive sketches of Switzerland, Greece, England, and other countries. His most important historical works are: *Histoire générale de l'Espagne* (2 vols., 1811); *Histoire des expéditions maritimes des Normands et de leur établissement en France au dixième siècle* (1826); *Histoire du commerce entre le Levant et l'Europe, depuis les croisades jusqu'à la fondation des colonies d'Amérique* (2 vols., 1832); *Les Juifs dans le moyen âge* (1834); and *Histoire de la Normandie sous le règne de Guillaume le Conquérant et de ses successeurs* (2 vols., 1835). Several of these have been translated into other languages. He also wrote several books of travel, made various translations, edited the *Romancero castellano* and other works, contributed to the *Biographie universelle* and the *Encyclopédie portative*, and published an autobiography in German entitled *Erinnerungen aus dem Leben eines Deutschen in Paris*. An account of his life and works, by Alfred Maury, was published in Paris in 1854.

DEPTFORD, a town and naval arsenal in Kent and Surrey, England, on the right bank of the Thames, at the mouth of the Ravensbourne, on the Croydon and Greenwich railways, and at the junction of the Croydon and Surrey canals, 3 m. S. E. of London bridge, and contiguous to Greenwich; pop. about 40,000. It contains a royal naval school incorporated in 1840, and two ancient hospitals for decayed pilots and shipmasters or their widows. Its principal feature was formerly the dockyard, established by Henry VIII., enclosing an area of 31 acres, with three slips for ships of the line on the river front, two for smaller vessels opening into a basin 260 by 220 ft., and two dry docks, one communicating with the basin, and the other, a double dock, with the Thames. This famous yard, in which Peter the Great worked as a shipwright, and near which Queen Elizabeth visited Sir Francis Drake on board the Pelican, was closed in 1869. The victualling yard for the royal navy, which adjoins it, is still open, and contains sheep and cattle pens, slaughter houses, salting

establishments, an extensive mill, bakeries, an immense brewery, and cooper shops. There are several private dockyards in the town, and manufactories of some extent, including large engine and boiler works. The retail trade is considerable, and the market gardens are famous. The workhouse stands on the site of Sayes court, the mansion of John Evelyn, in which Peter the Great resided, and the once beautiful grounds are covered in part by the viqualling yard.

DE QUINCEY, Thomas, an English author, known as the "English Opium Eater," born at Greenhay, a suburb of Manchester, Aug. 15, 1786, died in Edinburgh, Dec. 8, 1859. He was the fifth child of a merchant who at his death in 1793 left to his family a fortune of £1,600 a year. His childhood was chiefly passed in rural seclusion, with three sisters for playmates. He was sent to various schools, and early distinguished himself by proficiency in Greek. After vainly entreating his guardian to send him to the university, he ran away from school in 1802, and wandered about the country until he reached London, where he suffered terribly from exposure and hunger. Long afterward he wrote sketches of his life at this period; how much of these is true, how much fiction, it is impossible to say. According to his own account, he had in vain resorted to a Jew for an advance of money on the strength of his expectations, when at length an opening was made for reconciliation with his friends; and he attended school and visited in different parts of England and Ireland till he went to Oxford in December, 1803, where he remained till 1808. He first resorted to opium on a visit to London in the autumn of 1804, to dull the pains of rheumatism, and afterward took it habitually. He says that for ten years he "lived on the earth the life of a demiurgus, and kept the keys of paradise." It was his custom at this time to drink laudanum either on a Tuesday or Saturday night once in three weeks. On Tuesday night he went to the opera, where in the elaborate harmony and scenic display he saw unfolded the whole of his past life, with its passions exalted, spiritualized, and sublimed; not as if recalled by an act of memory, but as if present and incarnated in the music. On Saturday night he used to wander through the markets of London, and listen to the consultations of family parties on their ways and means, making himself familiar with their wishes, difficulties, and opinions. In 1809 he took the cottage at Grasmere which Wordsworth had occupied before him, and lived there constantly till 1819. Among his associates were Wordsworth and Coleridge at Grasmere, Southey at Keswick, Charles Lloyd at Brathay, and Wilson at Elleray. He afterward passed much of his time in London, Bath, and Edinburgh; his most intimate friend in London being for many years the celebrated peripatetic known as "Walking Stewart." He was occupied especially with the study of German literature

and philosophy, made translations from Lessing and Richter, and was among the first in England to interpret Kant, Fichte, and Schelling. In 1813 an irritation of the stomach, the consequence of his early sufferings, returned with a violence which yielded to no remedies but opium. From this time he became a regular and confirmed opium eater, taking sometimes as much as 320 grains a day. It had been the aim of his whole life to construct one single work, to which he proposed giving the title of an unfinished work of Spinoza, *De Emendatione Humani Intellectus*. The studies of many years had laid the foundation, but he could not command the efforts to rear the superstructure. In what he terms his state of imbecility he turned his attention for amusement to political economy. He welcomed the treatise of Ricardo as the first profound work on the subject, and it roused him to an activity which enabled him to draw up his "Prolegomena to all Future Systems of Political Economy." Yet opium paralyzed his efforts to complete even that short work. He failed to accomplish the preface; the arrangements for its publication were countermanded, and it first appeared in the "London Magazine," in 1824, under the title of "Templars' Dialogues." It is one of the most thorough as well as briefest exhibitions of the Ricardian theory of value. After two unsuccessful trials, he overcame his besetting habit, though it cost him a long and terrible struggle. In 1821 he went to London, and, as collaborator in the "London Magazine," became at once associated with Charles Lamb, Hazlitt, Allan Cunningham, Hood, Cary, and other writers. His "Confessions of an English Opium Eater" appeared in that periodical in 1821, and in a volume in 1822, and immediately obtained for him a high reputation. He contributed frequently to British periodicals, chiefly to "Blackwood's Magazine," "Tait's Edinburgh Magazine," and the "North British Review," furnishing autobiographical sketches, literary reminiscences, miscellaneous essays, and historical, philosophical, and critical discussions. He also furnished several articles to the "Encyclopædia Britannica," including the memoirs of Shakespeare and Pope. All his works show a wide range of learning and speculation, a delicate and subtle critical faculty, and a felicitous selection of words. He divides them into three classes: 1, papers whose chief purpose is to interest and amuse; 2, speculative, critical, and philosophical essays; 3, prose-poetry. His highest and most peculiar merit is in this third class, the best examples of which are his "Confessions" and "Suspiria de Profundis." In 1843 he removed to Lasswade, a village about 12 miles from Edinburgh. Here he returned to some of his earlier studies, and produced a volume entitled "The Logic of Political Economy." The first collective edition of his works was issued in Boston (21 vols., 1851-'9); it probably included a few things not written by him.

A selection from this American edition, with notes by the author, was commenced in Great Britain, of which nine volumes had appeared at the time of his death.

DERA GHAZEE KHAN, a large town of the Punjaub, British India, 4 m. from the right bank of the Indus, and 40 m. W. by S. of Mooltan; pop. about 25,000, half Hindoos and half Mohammedans. It has 125 Hindoo temples and 160 mosques, and a bazaar with 1,600 shops; also manufactories of silk, cotton, and mixed fabrics, and coarse cutlery. Being at the intersection of two great routes of travel, it has considerable trade.

DERAYEH, or **Derbidjeh**, a town of Arabia, in Nedjed, lat. $24^{\circ} 30' N.$, lon. $46^{\circ} 38' E.$, 385 m. E. of Medina. It lies in a fertile and well watered valley at the foot of Mount Khur, and in the earlier part of this century was famous as the capital and stronghold of the Wahabees. It was then strongly fortified in the oriental style, and contained 40,000 inhabitants, 30 mosques, and 30 schools. In 1818 it was taken and destroyed by Ibrahim Pasha in the war for the suppression of the Wahabees. Although that sect is again dominant in Nedjed, Dera-yeh remains a mass of ruins and its environs are uncultivated, as it is considered unlucky to rebuild or reinstate a city so completely overthrown; and their seat of government is now Riad, about 10 m. S. E.

DERBEND, or **Derbent**, a fortified town of Russia in Daghestan, on the W. shore of the Caspian

sea, lat. $42^{\circ} 3' N.$, lon. $48^{\circ} 15' E.$; pop. in 1867, 15,739, consisting of Mohammedans, Armenians, and Jews. The city rises from the harbor on the side of a wooded mountain, in the form of a quadrangle, and the summit is crowned by a citadel. The inhabitants manufacture silk, woollen, and cotton stuffs, and cultivate the vine and saffron. It is partly covered by walls, now dilapidated, but which were formerly of great strength, and also enclosed the defile known to the ancients as Albanian gates. From the iron gates of these walls it has its name, signifying "closed gates." Near Derbend commences the famous wall which extends westward for nearly 120 m. through Tabasseran, and formerly served as a defence to Persia against the northern barbarians. Its builder is unknown, some having attributed it to Alexander, others to Chosroes I. In 728 Derbend was taken from the Khazars by the Arabs, and in 1220 by the Mongols. In 1589 the Turks captured part of the town, but were again expelled. It was captured by Russia in 1722, restored to Persia in 1735, and taken again in 1795 by the Russians, who have kept it since.

DERBY, a town of New Haven co., Conn., on the Housatonic river, at its junction with the Naugatuck, 9 m. W. of New Haven; pop. in 1870, 8,920. The Naugatuck and the New Haven and Derby railroads intersect here. The town has a fine landing on the E. side of the Housatonic, just below the junction of the Naugatuck, admitting vessels drawing 10 ft. of water, and was formerly extensively engaged in the West India trade and in ship building. It contains the villages of Ansonia and Birmingham. (See ANSONIA, and BIRMINGHAM.)

DERBY, a parliamentary borough and the county town of Derbyshire, England, on the Derwent, and on the Midland railway, at its junction with several branch lines, 127 m. by rail N. N. W. of London; pop. in 1871, 49,793. It is the principal depot of the Midland railway company, with a station 1,050 ft. long. The town hall is a fine building with carvings in relief and a high clock tower. The church of All Saints is a splendid edifice, built in the reign of Henry VII. in rich Gothic style. St. Alkmund's church has a Gothic spire 205 ft. high. St. Peter's is the oldest and St. Andrew's the newest of the churches. There are 44 places of worship, of which 17 belong to the established church. There is a philosophical society founded by Dr. Erasmus Darwin, with a well stocked museum, a mechanics' institute, an atheneum, an infirmary, a county asylum, and a county prison. The free grammar school is one of the oldest in England. A fine arboretum of 16 acres, laid out in 1840 by London, and presented to the city by Joseph Strutt, is a popular resort. There is also a new park of six acres, the gift of another citizen. Manufactures are carried on to a considerable extent, including silk, hosiery, lace, iron and brass work, carriages, harness, shot, and porcelain. The first

Derbend.

silk mill in England was built here in 1718, and there are now 25 establishments of the kind. The marbles and spars found in the vicinity are wrought into ornaments. Derby gives the title of earl to the Stanley family.

DERBY. I. Edward Geoffrey Smith-Stanley, 14th earl of, and Baron Stanley, a British statesman, born at Knowsley Park, Lancashire, March 29, 1799, died there, Oct. 23, 1869. He was educated at Eton and at Christchurch, Oxford, and was distinguished at the university for his classical attainments, gaining the prize for Latin verse in 1819. In 1821 he entered parliament as member for Stockbridge, and soon took rank among the ablest debaters and most prominent leaders of the whig opposition to the ministry of the earl of Liverpool. He was elected member for Preston, Lancashire, in 1826, and on March 11, 1827, took office as under secretary for the colonies in Canning's administration, which office he continued to hold in the Goderich cabinet until its dissolution in January, 1828. During the three years of the Wellington government he figured among the prominent orators and statesmen in the house of commons. On the formation of the reform cabinet of Lord Grey in 1830, he was appointed chief secretary for Ireland, with a seat in the cabinet. He failed of reelection from Preston, and represented the borough of Windsor from 1830 to 1832, when he was returned by one of the divisions of Lancashire. In the great struggle of 1832-'3, which resulted in the passage of the reform bill, the church temporalities bill, and the bill to establish national education in Ireland, Mr. Stanley took a brilliant and effective part, and was the strongest antagonist of O'Connell in his agitation for a repeal of the union. In 1833 he exchanged the office of chief secretary for Ireland for that of secretary of state for the colonies, being nominated to this post with the special object of carrying the abolition of slavery in the West Indies, which was effected under his auspices. In the following year, on the succession of his father to the earldom, he became known by the courtesy title of Lord Stanley, and in the same year retired from the cabinet in consequence of his non-concurrence with the ministerial proposition to appropriate the surplus funds of the Irish church establishment for secular education. In the brief administration of Sir Robert Peel (December, 1834, to April, 1835), Lord Stanley refused to take office, and long before the close of Lord Melbourne's administration he and his followers were found voting steadily with the conservative opposition, as avowed members of that party. In 1841 the whigs went out of office, and Sir Robert Peel formed a cabinet in which Lord Stanley occupied a seat as colonial secretary. In 1844, while his father was still living, he was summoned by writ to the house of lords as Baron Stanley of Bickerstaffe, and assumed the leadership of the conservative party in that body.

When Sir Robert Peel resolved in 1845 to adopt a free-trade policy, and remove prohibitive duties on foreign grain and breadstuffs, Lord Stanley left the cabinet and became the leader of the protectionist opposition. When, in December, 1845, Sir Robert tendered his resignation to the queen, Lord Stanley was invited by her majesty, at the instance of Lord John Russell, to form a protectionist cabinet, but he declined. During the six years of Lord John Russell's tenure of the premiership, Lord Stanley added to his already high fame as an orator and a statesman by his course as leader of the opposition in the house of lords. His speech on the Irish poor laws in 1849, that on the affairs of Greece in 1850, and his explanation of the reasons why he declined the premiership in February, 1851, when Lord John Russell's ministry were defeated in the house of commons on Mr. Locke King's motion for an extension of the franchise, are among the most remarkable of his forensic efforts. On the death of his father, June 30, 1851, he succeeded to the earldom and the vast ancestral estates of his family in England and Ireland. On Feb. 20, 1852, Lord John Russell having sustained another defeat on the militia bill, Lord Derby was again called to construct a cabinet, and succeeded in performing the task; but failing to obtain the support of parliament for his financial measures, he resigned in December of the same year. On the fall of the coalition ministry of Lord Aberdeen in 1855, he refused an invitation to form a new cabinet; but on the resignation of Lord Palmerston in 1858, he took the seals once more as first lord of the treasury. Being defeated on a measure of parliamentary reform, he dissolved parliament; but the new house of commons passed a vote of want of confidence in June, 1859, and he was consequently forced to resign. For seven years he remained out of office, and during that period devoted much time to the study of the classics. His translation of Homer's Iliad in blank verse, published in 1864, is one of the best versions of the great epic. He became prime minister a third time on the fall of the liberal ministry of Lord Russell in June, 1866, and under his administration the reform bill of 1867, establishing household suffrage, was passed. The new parliament, chosen on the issue of the disestablishment of the church in Ireland, was found to be strongly opposed to the government, and in February, 1868, Lord Derby resigned. A statue in his honor was erected at Preston in 1873.

II. Edward Henry Smith-Stanley, 15th earl, son of the preceding, born at Knowsley Park, July 21, 1826. He was educated at Rugby, and at Trinity college, Cambridge, where he took a first class in classics in 1848. Having been unsuccessful as a candidate for parliament from Lancashire in March, 1848, he set out on a tour of the United States, Canada, and the West Indies, and during his absence was returned from Lynn Regis, which he continued to represent

until he succeeded to the peerage. After his return in 1850 he made an able speech in the house of commons on the condition and administration of the sugar colonies. He next made a visit to the East, and while in India, in March, 1852, was appointed under secretary for foreign affairs in his father's first administration. In 1853 he submitted a plan for the reform of the administration of India, more thorough than that contemplated by the existing ministry, and foreshadowing that adopted in 1858. Though he was a conspicuous member of the conservative party, Lord Palmerston offered him a place in the cabinet in 1855, which he declined. He became secretary for the colonies in the second Derby cabinet in 1858, and on the resignation of Lord Ellenborough in May became president of the board of control, with the title of her majesty's commissioner for the affairs of India. The transfer of the management of Indian affairs from the East India company to the officers of the crown was effected under his direction, and he became the first secretary of state for India. In the third administration of Lord Derby, in 1866, he became secretary of state for foreign affairs, and conducted with marked success the negotiations for the settlement of the Luxemburg difficulty. He went out of office on the accession of Mr. Gladstone in December, 1868, and on April 1, 1869, was installed lord rector of the university of Glasgow. On the death of his father in October, 1869, he took his seat in the house of lords, of which he became one of the most influential members. In 1870 he married the dowager marchioness of Salisbury, and on Feb. 20, 1874, resumed the direction of foreign affairs as a member of Mr. Disraeli's cabinet.

DERBYSHIRE, a central county of England, bordering on Yorkshire, Nottinghamshire, Leicestershire, Staffordshire, and Cheshire; length 56 m., greatest breadth 34 m.; area, 1,030 sq. m.; pop. in 1871, 380,558. Capital, Derby. The county is level or moderately hilly, abounding in fine scenery, fertile, well cultivated, and rich in minerals. It is watered by the Derwent, Trent, Dove, Wye, Erewash, and Rother. The S. and E. parts produce wheat, barley, and other kinds of grain; the N. part, where the surface is more hilly and the climate colder, is occupied chiefly by oat fields and pastures. The elevated region called the High peak or Derbyshire highlands, consisting of a succession of bleak hills, some of which rise nearly 2,000 ft. above the sea, interspersed with narrow valleys, is famous for its romantic scenery. The climate is rather cold and moist, thick fogs and even hoar frost not being uncommon in summer. Dairy husbandry is carried on in nearly all parts of the county, and among the hills small sheep and a breed of light, slender horses are reared. Among the minerals are coal, iron, lead, zinc, copper, gypsum, black and variegated marble, fluor spar, small crystals called Derbyshire diamonds, chalcodony, jasper, and a few onyxes. The

coal field covers a large area, and belongs to the same great field which extends over part of the West Riding of Yorkshire and part of Nottinghamshire. Mining is an important interest, and there are extensive foundries and forges in the large towns. The lead mines have been worked on lease from time immemorial, and are the subjects of several very ancient and peculiar laws. The county is traversed by a large number of canals and railways. The manufactures are important, and comprise cotton, silk, calico, cambric, fustian, muslin, tape, candle wicks, machinery, agricultural implements, leather, hats, paper, and porcelain. The first cotton mill was built by Richard Arkwright at Cromford in 1771, and the county was also the cradle of the silk and woollen manufactures of the kingdom. In the mountain district are numerous tepid mineral springs, which are resorted to by invalids, especially those of Buxton and Matlock. There are in the county numerous remains of the circles and cromlechs of the druids, various relics of the Roman domination, such as roads and baths, and ruins of many mediæval castles, abbeys, and monasteries.

DERBYSHIRE SPAR, a variety of fluor spar found in Derbyshire, England, which is distinguished by its fine shades of purple, blue, red, and yellow. These, together with the soundness of the stone, render it well adapted for ornamental purposes. The manufacture of cups, tables, vases, inkstands, and other objects, is extensively carried on in several towns of the county, as at Derby, Buxton, Castleton, and Bakewell. The stone takes a high polish for one so soft; but the property which renders it easy to be worked makes it liable to be soon defaced by scratches. It is found near Castleton in fissures in the limestone rocks.

DERFLINGER, Georg von (originally Dörrling), a German soldier, born in Bohemia in March, 1606, died Feb. 4, 1695. At the age of 14 he fought in the Protestant army at the battle of Prague, and some ten years later entered the Swedish army as an officer under Gustavus Adolphus. His conduct in the Swedish victory at Leipsic, 1642, gained him the rank of major general. Afterward he entered the service of the elector of Brandenburg as lieutenant general, and distinguished himself against the Poles, Swedes, and French. In 1670 he became field marshal, and in 1674 baron of the German empire; routed the Swedes near Rathenau, June 15, 1675, and at Fehrbellin three days afterward, and secured the greater portion of Pomerania for the elector. In 1678 he was made military governor of lower Pomerania; and in the winter campaign of 1678-9 he caused 9,000 soldiers and 30 guns to cross the ice on sleds as far as Tilsit, and routed the Swedes near the latter city.

DERG, Lough (red lake), a lake in the county Donegal, Ireland, about 7 m. E. S. E. of Donegal, 3 m. long, and 2½ m. wide at the broadest part. It is enclosed on all sides except the

south by steep, barren hills from 700 to 1,200 ft. high. It lies 467 ft. above the level of the sea, and is 75 ft. deep. A multitude of islands dot its surface, one of which, called Station island, about an acre in extent, contains a cave known as St. Patrick's Purgatory, to which from 10,000 to 15,000 pilgrims from all parts of Ireland resort annually between June 1 and Aug. 15. They remain on the island, which contains two chapels, a house for the priests, and a few cabins, from three to nine days, their only food during that time being bread and water. Saint's isle, which was the original seat of St. Patrick's Purgatory, contains the remains of a priory founded in the 7th century.—There is another Lough Derg, forming an expansion of the river Shannon between Tipperary and Galway, about 24 m. long and from 2 to 6 m. wide.

DERHAM, William, an English divine and natural philosopher, born at Stoughton, near Worcester, in November, 1657, died at Uppminster, near London, April 5, 1735. He became rector of Uppminster in 1689, and canon of Windsor in 1716. He contributed largely to periodical literature, and edited some of the works of Ray the botanist and Hook the natural philosopher. As a member of the royal society he contributed valuable scientific papers to its "Transactions." The most important of his published works are: "The Artificial Clockmaker" (4th ed., 1734); "Physico-Theology" (16 discourses preached at Boyle's lecture, 1713), and "Astro-Theology" (1714), designed to prove the existence and attributes of God from an examination of the works of creation; and "Christo-Theology" (1730), a sermon to prove the divine origin of Christianity.

DERMESTES, the scientific name of the larder beetle (*D. lardarius*, Fabr.), one of the largest and most destructive of museum pests. It is about half an inch long, oblong-oval, with short legs, and black, the base of the wing covers with a grayish buff broad band. Slow in its movements, it seeks some crevice or feigns death when disturbed. The larvæ are hairy,

1. Larva of *Dermestes lardarius*. 2. *Anthrenus*. 3. Larva of *Anthrenus*. 4. Pupa of *Anthrenus*.

the body ending in a pencil of hairs. The genus *anthrenus*, of the same family of skin beetles, not more than one eighth of an inch long, generally less, is covered with transverse wavy bands of irregular spots; the larva is short and thick, with long bristles. Both these beetles commit their depredations in the larva

condition during the summer or latter part of spring; they attack and often completely destroy natural history specimens of every kind, where any animal matter remains. The constant evaporation of benzine, camphor, creosote, and turpentine in the museum cases will usually keep them out; specimens thoroughly impregnated with carbolic acid, arsenic, or corrosive sublimate are safe from their attacks. Their presence may be detected by the dust which they make falling beneath the specimens. The last is the *A. muscorum* (Fabr.).

DERMODY, Thomas, an Irish poet, born at Ennis in 1775, died at Sydenham, near London, in 1802. His father was a schoolmaster, and is said to have employed him while only in his ninth year as his assistant in teaching Latin and Greek. He afterward ran away to Dublin, enlisted in the army, and served in the expedition to Holland under the earl of Moira, who promoted him to a second lieutenantcy; but by his intemperate habits he lost the favor of his patron, and afterward lived some time in London, and died in extreme poverty. A small volume of poems written by him in his 13th year appeared in 1792. In 1793 he published a pamphlet on the French revolution, to which was appended a poem entitled "The Reform." During his residence in London he published two volumes of poems, in 1800 and 1802, and a separate poem, "The Battle of the Bards." His life, by J. G. Raymond, was published in 1805, and his works, under the title of "The Harp of Erin," in 1807, each in 2 vols.

DERICK. See CRANE.

DERRY. See LONDONDERRY.

DERVISH, or *Dervise*, a Persian word equivalent to the Arabic *fakir*, signifying poor, used in Mohammedan countries to designate a religious class corresponding in some respects to the monks of Christendom. There are many orders of dervishes, distinguished by peculiarities of faith, ceremony, and costume. They are gathered usually into communities, each in charge of a sheikh, and live together in monasteries, but many dwell in villages with their families. Their discipline professes to be very strict, its chief requirements being poverty, chastity, and humility. Mendicancy is forbidden, except in the order of the Bektashis, and their monastic rules require them to support themselves by the labor of their hands, though they are usually supplied by donations. With the exception of the order of the Mevlevis, all are allowed to marry and have dwellings outside of the convents, but must pass at least two nights of each week with their associates. Their religious rites consist of mortifications of the flesh, prayers, and dancing. Besides the fast of the Ramadan, they observe one weekly fast from morning till night, and they hold religious meetings on Tuesdays and Fridays. They are frequently to be seen in the streets haranguing the multitude and making a display of their wisdom and piety, but their

actual practices are often far from consistent with their professed standard. Some of them lead a vagrant life, and traverse all the countries of the East from the Mediterranean to the Ganges, being lodged and fed in the convents of their order; and they are occasionally met in European cities, playing the part of jugglers, sorcerers, and mountebanks. They wear coarse robes and go bare-legged and with the breast uncovered, and the use of intoxicating liquors and of opium is said to be common among them. The most numerous sect are the Mevlevis, or whirling dervishes, whose principal monastery is at Konieh in Anatolia. Their ceremonies consist chiefly of fantastic dances, in which they whirl around with great rapidity to the sound of a flute, stopping suddenly when the music ceases, or continuing until they drop from exhaustion. They do this in memory of their founder, Mevlevi Jelal

Turkish Dervishes.

ed-Din el-Rumi, the Persian poet, who died about 1262. He is said to have turned miraculously around for four days without food or nourishment, while his companion Hamza played the flute. The Rufais, or howling dervishes, sway their bodies backward and forward until they foam at the mouth and fall to the ground, vociferously ejaculating meanwhile the name of Allah and incoherent phrases. They are distinguished also for self-mortification. Their founder was Sheikh Ahmed Rufai, and they date from 1182. The Calenders are noticeable for their peculiar dress, which is sometimes parti-colored, and sometimes consists of only a sheepskin about the loins, while the upper part of the body is painted fantastically. There are older orders, but none of equal importance, and some that have various peculiarities of doctrine. The Munasihis believe in the transmigration of souls; the Esh-

rakis are given to a kind of poetical mysticism, seeing divinity in forms, colors, and sounds; and the Hairetis hold opinions almost equivalent to those of the ancient Epicureans. —Religious orders similar to the dervishes are traced in the East beyond the Christian era, and tradition assigns many of the existing brotherhoods to the earliest days of Islam, the foundation of some being attributed to the caliphs Abubekr and Ali; but it is doubtful if any of them are older than the 9th century. The Marabouts among the Mohammedans of the Barbary states are similar to the dervishes.

DERWENT, the name of several rivers of England. **I.** A river of Cumberland, 32 m. long, rising in the district of Borrowdale, and flowing N. and then S. W. into the Irish sea, which it enters near Workington. It forms the cataract of Lodore near its head waters, and the lake of Derwentwater near Keswick, where it is joined by the Greta; expands into Bassenthwaite water at the town of that name, and receives the river Cocker at Cockermouth. Its banks abound in rich and varied scenery. **II.** A river of Derbyshire, rising in a place called "the trough," in the mountains which extend along the N. boundary of the county, and uniting with the Trent on the borders of Leicestershire, after a course of about 50 m. Its general course is S. E. It passes Chatsworth house and the towns of Matlock, Belper, and Derby. Its scenery, particularly in the upper part, is beautifully diversified. **III.** A river of Yorkshire, East Riding, rising near Harwood dale, flowing nearly S. with many windings, and falling into the Ouse at Barmby, after a course of about 60 m. It is navigable to Malton, 27 m. above its mouth.

DERWENT, a river of Tasmania, rising near the centre of the island in Lake St. Claire, flowing S. E. into the district of Norfolk, and entering the S. Pacific ocean through an estuary which separates the districts of Hobart Town and Richmond. The estuary is about 4 m. broad at its entrance, and retains this width for a distance of 6 or 8 m. inland. On Iron Pot island at its mouth is a lighthouse with a fixed light 70 ft. above the sea.

DERWENTWATER, James Radcliffe, third earl of, a leader in the English rebellion of 1715, born in 1689, beheaded Feb. 24, 1716. He belonged to an ancient Catholic family in Northumberland, was educated at St. Germain, and succeeded to the earldom in 1705. He joined with other noblemen of the north and west of England, toward the end of 1714, in a plot for the restoration of the Stuarts. The matter coming to the knowledge of the government of George I., the *habeas corpus* act was suspended and warrants were issued against the suspected. The standard of rebellion having been raised in Scotland, Lord Derwentwater commenced the movement in England, Oct. 6, 1715. Mr. Forster, a Protestant member of parliament for Cumberland, was chosen leader, but recruits came in slowly, and the plans of the leaders

were ill formed and ineffective. After marching into Scotland, and returning without accomplishing anything, and skirmishing about in Cumberland and Lancashire, they encountered the British troops under Gen. Wills at Preston, and, after an action in which Derwentwater displayed great bravery, surrendered on a promise that their lives should be spared. Lord Derwentwater was impeached and brought to trial in January, 1716. He pleaded guilty, and threw himself on the mercy of the crown, alleging his youth and inexperience as an excuse; but he was condemned to death as a traitor, and notwithstanding great efforts to obtain his pardon was beheaded on Tower hill. He died protesting his loyalty to James III., and asserting that "dishonorable terms had been proposed to him as the price of his life, which he had refused to accept." His life was written by Sydney Gibson.

DERZHAVIN, Gavriil Romanovitch, a Russian lyrical poet, born in Kazan in July, 1743, died in July, 1816. He was admitted to the gymnasium of Kazan in 1758, and attracted the attention of the principal, who took him to St. Petersburg. He entered the cavalry, where he distinguished himself, and subsequently the civil service, and was successively governor of Olonetz and Tambov. In 1791 Catharine II. appointed him secretary of state, and a few years later president of the college of commerce. On Paul's accession to the throne he was placed at the head of the council of state. In 1800 he was imperial treasurer, and in 1802 minister of justice. His principal poems are the odes on the birth of the emperor Alexander, against irreligion, on the new year 1781, to God, and on God's majesty. Many of them abound with beautiful moral sentiments and expressions, especially his ode to God, which was not only translated into several European languages, but also into Chinese and Japanese. It is said to have been hung up in the palace of the emperor of China, printed in gold letters on white satin; and, according to Golovnin's account, it was placed in the same manner in the temple of Yedo. His complete works are in 5 vols. 8vo (St. Petersburg, 1810-'15).

DESAGUADERO (Span., drain). **I.** A navigable river of Bolivia, the outlet of Lake Titicaca, flowing 180 m. S. S. E. through the plain named from it, with a descent of about 490 ft., into Lake Aullagas, which has no outlet. Its width varies from 25 to 60 yards, and it is quite deep. The current is very slow. Near Lake Titicaca it is crossed by a bridge built by the fifth inca of Peru for the passage of his army.

II. An immense inter-alpine plain comprised between the Cordilleras Oriental and Occidental of the Bolivian Andes, about one third in Peru, and the remainder in Bolivia, 400 m. long and from 30 to 80 m. wide. Save in the towns, the population is mainly made up of the Quichuas or Incas, and the Aymaras. From its elevation, which averages 13,340 ft. above

the level of the sea, its extent, and the number and height of the snow-capped peaks by which it is surrounded, it has been called the Thibet of South America. The main element in the formation of the more elevated portions is trachytic conglomerates in various stages of decomposition, especially in the northern parts, which are intersected by isolated hills and low mountain ranges. Corocoro to the north was long celebrated for its rich silver mines; and both silver and gold have been found in various localities, more particularly in the region contiguous to the Nevada de Illimani, from the base of which a large block of native gold was detached by lightning. The mass was afterward sold at an enormous price, and deposited in the museum of natural history at Madrid. The tin mines of Oruro are among the richest in the world; copper is said to be as plentiful in the mountain country as silver has been in the Cerro de Potosi; and many other minerals are likewise abundant; but, owing to the difficulty of transportation, these sources of wealth still lie unexplored. Of several thermal springs, those named Urimiri and Mochacamarea are the best known. Notwithstanding the intertropical situation of the valley, its elevation gives it a mild and salubrious climate. The year is divided into two seasons: summer, from November to April; and winter, from May to October. During the former, which is the wet season, almost every day brings rain, and the nights are often chilly, with occasional frost; but during the winter snow and rain are never seen, except at the commencement and end. Not a tree is to be seen. The lower districts are clothed with a beautiful green turf, and in the valleys grows a coarse grass affording excellent pasture. Although the plain is well watered by the great Lake Titicaca, Lake Aullagas, the river Desaguadero connecting these lakes, another smaller lake, and many minor streams, the cereals do not attain maturity. Potatoes are plenty and grow wild; and the quinoa (*chenopodium quinoa*), often used as a substitute for the potato, is sedulously cultivated. The banks of Lake Titicaca have a luxuriant growth of rushes useful to the Indians for making huts, mats, boats, and other commodities. Remarkable among the fauna of the plain are the guanaco and the allied genera of apacas, llamas, and vicuñas, all of which roam in numbers in every direction, yielding abundant fleeces of precious wool. Numerous herds of cattle graze along the banks of the rivers; horses, asses, and mules are very plentiful; and there are two rodents, a species of hare, and the viscacha, whose burrowings render travel on horseback dangerous in many localities. Some delicious fish are taken in the lakes and rivers. Of the towns, which are few and small, Oruro is the most important.

DESAIX DE VEYGOUX, Louis Charles Antoine, a French general, born at St. Hilaire d'Ayat in Auvergne, Aug. 17, 1768, killed at Marengo,

June 14, 1800. He was educated at the military school of Effiat, where he remained seven years, leaving at the age of 15 to enter the regiment of Brittany under the name of the chevalier de Veygoux. He continued to be a diligent student in the garrisons of Briançon and Huningue. At the breaking out of the revolution he became the aide-de-camp of Prince Victor de Broglie in the army of the Rhine. He favored the principles of the revolutionists, but deprecated their violent acts, and having signed a protest against the decree of Aug. 10, 1792, by which the legislative assembly suspended the authority of the king, he was cashiered and imprisoned for two months, but was reinstated by Carnot. All through the reign of terror his head was in peril on account of his aristocratic connections. His mother and sister were sent to prison by the committee of public safety, but he escaped with a second brief suspension from the service. He was restored at the intercession of Pichegru, under whom he served with distinction, and of Saint-Just, and was employed in 1796 in defending the Alsatian frontier against the Austrians. When Moreau took command of the army of the Rhine, Desaix became his lieutenant as commander of a division, and took an important part in the campaign in Bavaria and the famous retreat with which it closed. On the return of the army to the Rhine, Desaix defended the fort of Kehl; and notwithstanding its dilapidated condition, he held it two months against the repeated efforts of the archduke Charles, and finally concluded a highly honorable capitulation. The next year he again led the army across the Rhine, an operation in which he showed consummate skill. After passing some months at Strasburg, recovering from a severe wound, he was sent at his own request on a mission to Bonaparte in Italy. On the formation of the army for the invasion of England he was made chief of staff to Bonaparte, who was to be its commander. In the expedition to Egypt he received the command of a division, and after the storming of Alexandria marched to Cairo with the vanguard. He took part in the battle of the pyramids, and being ordered to pursue Murad Bey, defeated him in several encounters, drove him into Nubia, and conquered the whole of Upper Egypt in eight months. Here he established a regular government, and inspired the Egyptians with such esteem that they called him "the just sultan." When Bonaparte embarked from Egypt, he sent Desaix a sword with the inscription, *Conquête de la haute Égypte*, and ordered him to return home in the following November. He arrived at Toulon May 3, 1800, and hastened to join Bonaparte in Italy, where he arrived June 11, and was put in command of a division, with orders to prevent the army which had just taken Genoa from joining that under Melas at Alessandria. He was at some distance from the main army on the morning of June 14, but on hearing the artillery hastily returned,

and arrived in time to change the nearly lost battle of Marengo to a complete victory. He was shot through the heart as he was entering the action. Bonaparte had a medal struck in his honor, and decreed that a statue should be erected to his memory in the *place des victoires* at Paris, and that his grave should be placed on the summit of the Alps, under the care of the monks of St. Bernard.

DÉSAUGIERS, Marc Antoine Madeleine, a French song writer and dramatist, born at Fréjus, Nov. 17, 1772, died in Paris, Aug. 9, 1827. At the age of 17 he produced a successful one-act comedy in verse. During the revolution he went to Santo Domingo, where his sister had married a planter; and when the insurrection of the blacks broke out, he barely escaped with his life to the United States, where he earned a living by teaching music. He returned to France in 1797, and wrote songs and light comedies. Some of his plays, such as *Les petites Danaïdes*, *La chatte merceilleuse*, and *M. Vautour*, had an unprecedented success; while his songs were more popular than those of any other writer except Béranger.

DESAULT, Pierre Joseph, a French surgeon, born at Magny-Vernais, a village of Franche-Comté, in 1744, died in Paris, June 1, 1795. He commenced his education for the church in a Jesuit school, but exhibiting a strong inclination for surgery, he was permitted to acquire the rudiments of the art from the barber-surgeon of his native village. He was then sent to the military hospital at Belfort, where he remained three years, giving special attention to gunshot and sword wounds. While here he translated Borelli's treatise *De Motu Animalium*, adding notes and illustrations. In 1764 he went to Paris, and availed himself of the facilities for dissection with such success that he soon opened a very popular school of anatomy. In 1776 he became a member of the college of surgery. Thereafter he made rapid progress, becoming successively chief surgeon to the hospital of the college, consulting surgeon to that of St. Sulpice, chief surgeon to La Charité, and finally to the Hôtel-Dieu, with the reputation of being the most skilful operator in France. In connection with the Hôtel-Dieu he instituted a clinical class which attracted many students. The most important cases that came before the class were reported in a serial, entitled *Journal de Chirurgie*, edited by the pupils. In the revolution he was arrested while lecturing, May 28, 1793, and carried to the Luxembourg, from which he was liberated at the end of three days. On the establishment of the school of health he was appointed clinical professor for external diseases. While attending the dauphin, then a prisoner in the Temple, he was seized with illness, which almost immediately terminated in delirium and death. The rumor of the time asserted that he was poisoned because he refused to lend himself to the murder of his patient. An autopsy showing no trace of poison, his death was set

down to ataxic fever. The republic pensioned his widow. He introduced numerous improvements in surgical instruments and their use, especially for the treatment of fractures and ligature of arteries. In conjunction with his friend Chopart, he wrote the *Traité des maladies chirurgicales* (2 vols. 8vo, 1780), which has been translated into English by Trumbull. His *Œuvres chirurgicales* were published by Bichat (3 vols. 8vo, 1798-'9).

DES BARRES, Joseph Frederick Wallet, an English soldier and hydrographer, born in 1722, died in Halifax, N. S., Oct. 24, 1824. He was descended from a French family which emigrated to England after the revocation of the edict of Nantes. Graduating from the royal military college at Woolwich, he embarked in March, 1756, as lieutenant in the 60th regiment of foot, for America. Having raised more than 300 recruits in Pennsylvania and Maryland, he formed them into a corps of field artillery, which he commanded until the arrival of one of the battalions of the royal train from England. In 1757 he commanded a detachment of volunteers against the Indians, who had committed depredations in the neighborhood of Schenectady and other frontier towns, and not only defeated them, but won them over to the assistance of the English. In 1758 he was engaged in the expedition against Louisbourg, where he did good service; and after the capitulation he drew up a chart of the St. Lawrence, which was useful in the campaign of the next year. At the siege of Quebec he was aide-de-camp to Gen. Wolfe, and was making his report when that hero received his mortal wound, and fell dying in his arms. In 1760 and subsequently he conducted the operations for the defence of Quebec and the other places acquired by the British, as well as those for the reduction of Fort Jacques Cartier and others that still held out, thus completing the conquest of Canada. He was afterward ordered to Nova Scotia to assist Gen. Bastide in tracing designs and making estimates of the expense for fortifying the harbor of Halifax, and securing its dockyard. In 1762 he served as directing engineer and quartermaster general in the expedition for retaking Newfoundland, and received public thanks for his service in the recovery of that island. After making surveys of some of its principal harbors, he was ordered to New York, to proceed on reconnoitring excursions and report observations on the expediency of establishing a chain of military posts throughout the British colonies. In 1763 Lord Colville received instructions to employ him on the survey of the coast of Nova Scotia, in which he was engaged till 1773. The want of correct charts of the coast of North America for the fleet engaged in carrying on the American revolutionary war being severely felt, he was selected to adapt the surveys of Holland, De Brahm, and others to nautical purposes. These he published in 1777 under the title of "The Atlantic Neptune," in two

large folio volumes. In 1784 he was appointed governor of the island of Cape Breton, and military commander of that and of Prince Edward island; and soon afterward he commenced building the town of Sydney, and opened and worked the valuable coal fields at the entrance of the river. In 1804 he was appointed lieutenant governor and commander-in-chief of Prince Edward island, being then in his 82d year. In person he was short, and at the age of 95 lithe and active. He was Capt. Cook's teacher in navigation.

DESCARTES, René (Lat. RENATUS CARTESIUS), a French philosopher, born at La Haye, Touraine, March 31, 1596, died in Stockholm, Feb. 11, 1650. He was the youngest son of a councillor of the parliament of Rennes, of an ancient and noble family, and early in life evinced such a disposition to inquire into the nature and causes of things, that he was called the young philosopher. His education was conducted in the Jesuit college of La Flèche, where he made rapid progress in the Greek and Latin classics, and the other ordinary studies of such an institution. He contracted also while there a friendship with Mersenne, which lasted until the end of his life; and though Mersenne became a monk, it was chiefly through him that Descartes communicated, from his profound scholastic retirement, with the outside learned world. After leaving college, in his 16th year, he occupied himself in preparing for the military life to which he was destined by the wishes of his family and the spirit of the times. But his health being delicate, he was sent to Paris with a tutor, to pass two years in the further prosecution of his studies. In 1616 he joined the army of Maurice of Nassau, and while in garrison at Breda composed his *Compendium Musicae*, which seemed a prelude to the research for harmony which he was soon about to carry into all the realms of knowledge. He was driven to it, doubtless, by the painful uncertainty and chaotic confusion which reigned in nearly all the departments of human inquiry. He was troubled by the doubts of his epoch, but he shared also in its grand hopes. In 1619 he left the Dutch army, and entered as a volunteer the service of Maximilian of Bavaria, the head of the Catholic league; he was present at the battle of Prague in 1620, and made with the imperialists the campaign of Hungary in 1621. The atrocities which he witnessed in this war are said to have been the occasion of his resigning his commission. After visiting the greater part of the north of Europe, he returned to France, sold his estates, and speedily resumed his journeys. He spent some time in Switzerland and Italy, being present at Rome during the jubilee of 1625, and wherever he went observing the phenomena of nature, and perfecting himself in the acquisition of knowledge. At Neuburg, on the Danube, where he passed the winter, the plan of devoting the remainder of his days to the reconstruction of the principles of hu-

man knowledge, which had long been maturing in his mind, took a definite shape. While he wandered from the Baltic to the Mediterranean, he was digesting the outlines of the great discoveries in geometry and method, destined soon to change the intellectual currents of the world. Going first to Paris, where he moved about from one obscure house to another to escape the intrusion of friends, he next settled in the neighboring country, and finally fixed his retreat in Holland. Emancipated from all social ties and relations, his life became that of an ascetic. In 1633 he made a brief visit to England, and the following year to Amsterdam; and he constantly, through the mediation of Mersenne, maintained an active correspondence with the learned men who sought his instruction or his friendship. In 1637 he began a more open career by the publication of a volume entitled *Discours de la méthode*, which contained treatises on method, on dioptries, on meteors, and on geometry. The first of these, besides an admirable picture of his life and of the progress of his studies, furnished a clear outline of a new science of metaphysics, only expanded in his later and larger works. In 1641 he published in Latin *Meditationes de Prima Philosophia*, which carried his speculations into abstruse questions as to the existence of God and the immortality of the soul. He invited criticisms of these, which in later editions are arranged and replied to under seven heads, wherein he considers all the objections raised to his original system. These works filled Europe with his name, and at the close of 1641 he was invited to France by Louis XIII., but he refused to quit his retirement. In 1644 appeared *Principia Philosophiæ*, which three years later was translated into French by Claude Picot. He then went to France, where a pension of 3,000 livres a year was conferred upon him; but as Queen Christina of Sweden invited him to Stockholm, at the same time appointing him director of an academy which she proposed to establish, at a salary of 3,000 crowns a year, he was induced once more to abandon his native country. The rigors of the climate, combined with the early hours exacted by the queen, in an eccentric wish to take lessons from him, led to his death in less than two years. He was buried at Stockholm; but 16 years afterward Louis XIV. caused his remains to be disinterred and carried to France, where he was entombed in the church of Ste. Geneviève du Mont.—Descartes created an epoch in the history of the human mind, and should be classed with men like Plato, Aristotle, Bacon, Newton, and Kant. With Bacon, he was one of the founders of modern philosophy, but he pushed his inquiries further than Bacon in many respects, and in a somewhat different sphere. What the latter accomplished for natural science, Descartes accomplished for moral and metaphysical. As a metaphysician, he was the fountain head of the speculation of a whole subsequent century, while he added to

his glory in that sphere the scarcely inferior distinction of a great discoverer in mathematics, and of an earnest laborer in nearly all the domains of physical science then known. Not wholly exempt from the errors of his day, he was yet immeasurably in advance of his day; while he enjoys this singular eminence among philosophers, that his expression is as clear and beautiful as his thought is great. French style appears nowhere more simple and direct than in the varied dissertations of Descartes, even when he treats of subjects the most recondite and difficult. It was owing to this admirable clearness, perhaps, as much as to the more essential merits of his system, that it was said at the time of Descartes's death that everybody in England and France, who thought at all, thought Cartesianism. The fundamental principles of the philosophy of Descartes relate to his method, which takes its point of departure in universal doubt, and places the criterion of all certitude in evidence, or in other words, in reason, as the sovereign judge of the true and the false; to the erection of the individual consciousness into the fundamental ground and source of all correct philosophy (*Cogito, ergo sum*); to the radical distinction which is drawn between the soul and the body, the essential attribute of the former being thought, and that of the latter extension; to the demonstration of the existence of God from the very idea of the infinite; to the division of ideas into those which are innate, those which are factitious, or created by us, and those which are adventitious, or come from without by means of the senses; to the definition of substance, as that which so exists as to need nothing else for its existence, and which is applicable in the highest sense only to God, who has his ground in himself, but only relatively to the thinking and corporeal substances, which need the coöperation of God to their existence; and to the affirmation that the universe depends upon the productive power, not only for its first existence, but for its continued being and operation, or in other words, that conservation is perpetual creation. Other points in this philosophy are important, and other aspects of it are to be regarded by the student; but for the popular reader these chiefly deserve attention, because these were characteristic and creative, and furnished the themes for the greater part of the agitated discussions of later years. From his theory of doubt, except upon evidence, for instance, the philosophy of the 17th century, and the whole of modern philosophy in fact, derived that disdain for the authority which formerly fettered the free movements of the mind, and that reliance upon reason, which Arnauld, Malebranche, Pascal, Bossuet, Fénelon, and others appealed to so effectively. The vivid determination of the consciousness, or the ME, as the proper object of metaphysical investigation, was the starting point of those great systems of thought, both Scotch and German, which are such remarkable phenomena in the history

of intellectual development. It is also easy to trace to his doctrine of substance the pantheistic speculations of Spinoza, Fichte, and Hegel. In short, the schemes of Geulincx, Leibnitz, Wolf, Kant, and perhaps of Swedenborg, are all more or less directly affiliated to the great leading ideas of the French thinker. As a whole, therefore, it is not surprising that his system produced an instant and vivid sensation. The scholastics were astonished by an assault at once so radical and so vital; the skeptics saw a skepticism more searching than theirs rising into the most solid religious faith; while the independent men of science, who had long been struggling against the methods of the old dialectics, received with joy a doctrine which seemed to place their researches on an immovable foundation, and to promise to crown them with the richest fruits of progress. For a while Descartes threatened to succeed to the place of absolute dictation and mastery which had been so long assigned to Aristotle. His influence passed from the cloister and the study to popular literature; all the great writers of the age of Louis XIV. were tinctured by it; but just as it appeared to have attained a universal acceptance, it began as rapidly to fade and shrink. The reasons of this decline are to be found partly in the growth of Locke's sensational philosophy; partly in the demonstrated impotence of Descartes's principles to resolve many of the higher problems to which he aspired; but chiefly in the discoveries of Newton and the progress of physics, which discredited his physical theories, and therefore brought his metaphysical conclusions into distrust. The theory of vortices, by which he endeavored to explain the movements of the heavenly bodies, gave place to the simpler theory of Newton as to a law of universal gravitation; but science has not ceased to confess its obligations to Descartes for his important discoveries as to the application of algebra to geometry, his contributions to dioptrics, to mechanics, and to hydrostatics, and for that fearless spirit of investigation which, if it led him into mistakes, enabled him also to anticipate many truths ascribed to a later period.—After the death of Descartes, in addition to the works already mentioned, were published *Le monde de Descartes, ou le traité de la lumière* (12mo, Paris, 1664); *Le traité de l'homme et de la formation du fœtus* (4to, Paris, 1664); and *Les lettres de René Descartes* (3 vols. 4to, 1657-'67). The principal complete editions of his writings are: *Opera Omnia* (8 vols., Amsterdam, 1670-'83); *Œuvres complètes de Descartes* (9 vols., Paris, 1724); *Œuvres complètes de Descartes*, by Victor Cousin (11 vols., 1824-'6), which is perhaps the most perfect edition; and *Œuvres philosophiques de Descartes* (1835), by Garnier, who added a life and a thorough analysis of all his writings. The dissertations on his philosophy are almost without number, but the few most useful or curious are comprised

in the following list: *Recueil de pièces curieuses concernant la philosophie de Descartes*, published by Bayle (Amsterdam, 1684); *Mémoires pour servir à l'histoire du Cartésianisme*, by Huet (Paris, 1693); *Mémoires sur la persécution du Cartésianisme*, by Cousin (Paris, 1838); *Histoire et critique de la révolution cartésienne*, by M. Francisque Bouillier (2 vols., Paris, 1842); and *Le Cartésianisme, ou la véritable rénovation des sciences*, by Bordau-Demoulin (2 vols., Paris, 1843). Of late years the study of Descartes has revived among the French philosophers. See Damiron's *Essai sur l'histoire de la philosophie en France au XIX^e siècle* (1828) and *Essai sur l'histoire de la philosophie au XVI^e siècle* (1846); Bouillier's *Histoire de la philosophie cartésienne* (2 vols., 1854; 2d ed., 1867); and Millet's *Descartes, sa vie, &c.* (1867).

DESCENT, in law, the transmission of an estate in lands by operation of law, upon the decease of a proprietor, without any disposition thereof having been made by him. The term is derived from a principle existing until very recently in the English law, that an inheritance could never lineally ascend, yet upon failure of lineal descendants it could ascend collaterally. Thus the father could not be the heir of his son, but the uncle could inherit from the nephew. There was therefore an inaptness in the expression even as used in the common law doctrine of inheritance, and still greater incongruity in American law, which allows a lineal ascent from the son to the father. Succession is the more appropriate phrase in the Roman law, and from that adopted in the French and other modern systems. Gibbon has well remarked that the Roman law of hereditary succession "deviated less from the equality of nature than the Jewish, Athenian, or English institutions." The oldest son of a Hebrew inherited a double portion. By the Athenian law the sons inherited jointly, but the daughters were wholly dependent upon what provision their brothers might choose to give them by way of marriage portion. The English law of primogeniture gives, not a larger portion, but the whole, to the eldest son; and in various other respects which will be presently referred to, the natural order of equity is singularly disregarded in the law of descent. On the other hand, by the Roman law, when a man died intestate, all his children, both sons and daughters, inherited alike; and in case of the decease of either, the descendants of the decedent would take such share as would have belonged to him or her. The distinction of agnates and cognates was indeed introduced at an early period, whereby the descendants of females, who were called cognates, were excluded; but by imperial constitutions they were restored to the right of succession, with a diminution of a third in favor of the agnates, that is, descendants of males, and even this discrimination was abrogated by Justinian. On failure of lineal de-

scendants, the father and mother or other lineal ascendants were admitted. Such was the rule as to lineal succession. In respect to collateral inheritance, by the law of the twelve tables, agnates, whether male or female, were admitted alike, but by the latter law all females of collateral kindred were excluded; the hardship of the rule was in some measure relieved by the prætor, who gave to females still excluded a share of the personal estate. Justinian restored the right of succession as it had originally existed. Descendants of females of the collateral kindred were still, however, left unprovided for. Thus, though a sister could inherit from her brother, yet her children could not; but the reverse of the rule did not hold, for there was no corresponding disability in the brother to inherit from the children of his sister. The rule of collateral succession was that the nearest agnate (or all the agnates of the same degree) took the whole estate. The mode of estimating the degree of consanguinity by the Roman law was to take the entire number of intermediate persons in the ascending and descending scale between the parties whose relationship was in question; thus, first cousins would be related in the fourth degree, being each two removes from the common ancestor. But by the canon law, which has been taken as the basis of the English rule of descent, the consanguinity is measured by the number of degrees between the more remote of the two persons and the common ancestor, which in the case of cousins would be two degrees; and it would be the same between uncle and nephew. The rules of descent by the common law of England are exceedingly artificial, being derived chiefly from the old feudal system, and by usage become fixed, though the reasons that first gave rise to them have long ceased to exist. The principal of these rules are as follows: 1. The estate descends lineally to the oldest son, to the exclusion of all others; or if he is deceased, then to his descendants, male or female, following the same rule of preference in all respects as prescribed in this and the following rules. 2. In case of the decease of the oldest son without issue, then to the next oldest and his descendants, and so to the last of the males. 3. In case of failure of male issue, then to the daughters, who, contrary to the order prescribed in the preceding rules, do not take successively, but become seized jointly of a peculiar estate called coparceny, each coparcener having an absolute undivided interest, which she may convey, or which on her decease will descend to her heirs. 4. Failing all lineal descendants, the estate does not ascend lineally (that is to say, to the father or grandfather, who by the common law are incapacitated to take directly from the son or grandson, though they may indirectly through collateral heirs), but to the nearest collateral kindred, still following the preference of males to females, and, of the males of the same degree, the oldest having the ex-

clusive right. Thus the oldest brother and his descendants will take; failing whom, the next brother and his descendants; or in default of brothers, then all the sisters in coparceny; but if there be no brothers or sisters, then the kindred of next degree will succeed, subject to the same rules of preference. 5. In respect to collateral succession, several other rules apply. (a.) The heir must be not only the nearest of kin of the person last seized, but must be of the whole blood, that is to say, must be descended from the same two ancestors, male and female; as, if A and B are brothers having the same father but not the same mother, if an estate descends to A from the father and he dies, B shall not inherit from him, although if A had died before the father B would have been the heir of the father. So far was this exclusion carried by the common law, that a sister of the whole blood would take in preference to a brother of the half blood, and the estate would even escheat rather than it should descend to the latter; and the same rule prevailed in respect to more remote collateral relatives. (b.) It is also necessary, in order to inherit collaterally, to be of the blood of the first purchaser, that is to say, of the person who first acquired the estate; as, if A purchase land and it descends through several generations to B, who dies without issue, no collateral relative of B can take the estate unless he is also of the blood of A, from whom it originally came. (c.) Kindred on the side of male ancestors, however remote, are preferred to kindred descended from females, however near, unless the estate descended from a female, in which case the kindred of such female can alone inherit. Thus the relatives on the father's side are preferred to the mother's, and on the grandfather's to the grandmother's, and so in all the degrees of ancestry. (d.) In computing degrees of consanguinity, the rule of the canon law is adopted as before mentioned, whereby the relationship to the common ancestor is alone considered. According to this rule, brothers are related in the first degree, cousins in the second; but as this would often make a different degree of relationship between the same parties, according as it was computed from one or the other to the common ancestor, it was found necessary to adopt a further rule, that the consanguinity of each to the other was to be determined by that of the most remote from the common ancestor. Again, there might sometimes be different sets of kindred in the same degree of relationship by referring to different ancestors, as a nephew is in the same degree as an uncle, the common ancestor of the one being the father, of the other the grandfather; in such a case, another rule intervenes, viz.: that the relative representing the nearest ancestor shall take priority, according to which the nephew would inherit before the uncle. Several important changes have been made in the law of descent by statute 3 and 4 William IV., c. 106 (1833), the principal of which are: 1. That a lineal ancestor is permitted to inherit,

and takes precedence of a collateral heir; thus the father is preferred to the brother or sister. 2. Relatives of the half blood are relieved from disability to inherit, and succeed next after relatives of the same degree of the whole blood. 3. Several provisions are made for the determination of the question who was the purchaser from whom by the rules of common law the descent was to be traced. The person last entitled is to be deemed a purchaser, unless it be shown that he took by inheritance, and so of any preceding ancestor. In the case of a devise by a man to his heir, such heir shall be deemed to have taken by the devise and not by descent, and is to be regarded as a purchaser. When land is purchased under a limitation to the heirs of a particular ancestor, such ancestor is deemed the purchaser. From this summary of the English law of descent, which gives only the general rules without noticing certain exceptions which are said to exist by ancient usage in some places, it is apparent that the basis of the system was a condition of society no longer existing. The theory of seeking for a single male heir to the exclusion of all others belongs to the turbulent period when a military head of a family was needed, and all the other members of the family found shelter in a common mansion, under the protection of an organized domestic force. The perpetuation of the rule, in a period of private immunity from violence, can serve no other purpose than to keep together the estates of great land proprietors. This may be essential for maintaining the respectability of the titles of nobility, but is inapplicable to all other proprietors; and moreover, personal property, which was comparatively unnoticed by the feudal law, but which has become a large portion of the wealth of the kingdom, is distributed by another rule, conforming to the equitable principle of the civil law. The retention of this part of the old feudal law is therefore mainly attributable to the prejudice in favor of ancient usage which has always been characteristic of the English.—The law of descent in the United States is based upon the English statute (22 and 23 Charles II.) for the distribution of the personal estates of intestates, which statute is substantially in conformity with the civil law. In most of the states real and personal estate descend by the same rule, with the exception only of the interest of the husband and wife respectively, the former of whom may have an estate by curtesy, and the latter in dower. (See CURTESY, and DOWER.) The rule of descent in the state of New York, which may be taken as the law of most of the other states, is: 1. Of the lineal descendants of the intestate, an equal portion to all who are of equal degree of consanguinity, whether male or female; but in the case of the decease of any one of them, then his or her descendants take the portion that would have belonged to such deceased party if living; thus, should the intestate leave two children and three grand-

children, descendants of a deceased child, the estate will be divided into three parts, the three grandchildren taking the one third which would have belonged to the parent whom they represent. 2. Upon the failure of lineal descendants, the father of the intestate will inherit, unless the estate came by descent on the part of the mother. 3. If the father is not living, or cannot for the reason above mentioned take the estate, the mother will be entitled to hold it for life, the reversion to belong to the brothers and sisters. 4. If no lineal descendants or father or mother, then the estate will descend to the nearest collateral relatives of equal degree; and the same rule applies as in the case of lineal descendants, that the descendants of a deceased party take the same share that such ancestor would have been entitled to if living. The rules as to collateral succession are as follows: (a.) Brothers and sisters, or the children of deceased brothers and sisters, are first entitled; but in case no brother or sister is living, but there are descendants of several, then such descendants take equally *per capita*, and not *per stirpes* or representation, as would be the case if one of the brothers or sisters were living. (b.) If no brothers or sisters of the intestate nor descendants of deceased brothers or sisters, the next heirs are uncles and aunts, who take equally unless the estate came by descent on the part of one parent, in which case the relatives of that parent have the preference. Lineal and collateral relatives of the half blood take equally with those of the whole blood. In some of the states the brothers and sisters take to the exclusion of the parents, while in others the rules are still more liberal toward the parents than as above stated.—The rules of succession by the French civil code are nearly the same as those prevailing in this country. The variations are principally these: 1. If there are father and mother (or either of them) and brothers and sisters, the estate is divided into two parts, one of which belongs to the father and mother in equal proportion, the other to the brothers and sisters or descendants of a deceased brother and sister, such descendants taking by representation the share that the child whom they represent would have taken; if either father or mother is deceased, his or her share vests in the brothers and sisters. 2. If there is a father or mother, but no brothers or sisters, the collateral relatives take a half. 3. If there are children of different father or mother, the estate is divided into two parts, the paternal line taking one part and the maternal the other; children of the whole blood take a share in each moiety.

DESERTER, in military affairs, an officer, soldier, or sailor who abandons the public service in the army or navy, without leave. In England the punishment for desertion is, with certain limitations, left to the discretion of courts martial, death being the extreme penalty. By the articles for the government of the navy of the United States (art. 12), it is enacted that

"if any person in the navy shall desert to an enemy or rebel, he shall suffer death," and (art. 13) "if any person in the navy shall desert in time of war, he shall suffer death, or such other punishment as a court martial shall adjudge." The rules and articles for the government of the land forces of the United States authorize the infliction of corporal punishment not exceeding 50 lashes for desertion in time of peace, by sentence of a general court martial; and the laws do not permit punishment by stripes and lashes for any other crime in the land service. In time of war a court martial may sentence a deserter to suffer death, or otherwise punish at its discretion.

DESFONTAINES, René Louiche, a French botanist, born at Tremblay, Brittany, about 1752, died in Paris, Nov. 16, 1833. After studying at the college of Rennes, he went to Paris to prepare for the medical profession, but devoted himself chiefly to botany. In 1782 he received his degree as doctor, and in the next year wrote a paper on the organs of fructification in plants, which procured his admission into the academy of sciences. He then, at the expense of the academy, set out for the Barbary states, and during two years explored the natural history, especially the flora, of the north of Africa. He published the result in the *Flora Atlantica* (2 vols., Paris, 1798), which described 1,600 species of plants, 300 of which were new. After his return to Paris in 1785 he was appointed by Buffon to succeed Lemonnier as professor in the *jardin des plantes*, and from this time was employed in the duties of that office. His lectures treated of the physiology and anatomical structure of plants, rather than of their nomenclature. He was the first to indicate the difference in growth and structure between the monocotyledonous and the dicotyledonous plants. He made a botanical catalogue of the *jardin des plantes* (1804; 3d ed. in Latin, 1829), continued the *Collection des velins du muséum d'histoire naturelle*, which had been begun for Gaston of Orleans, published works on arboriculture and the artificial fecundation of plants, and wrote numerous memoirs.

DESFUL, or **Dizful**, a city of Persia, in the province of Khuzistan, on the E. bank of a river of the same name, 25 m. W. N. W. of Shuster; pop. estimated at 15,000. It is the principal mart of the province, and has a fine bridge of 22 arches, said to have been built by command of the celebrated Sapor. Indigo, oranges, and lemons are raised in the neighborhood. About 10 m. S. W. of the city are mounds of ruins, the foundations of which are of stone, and the upper portions of brick, which cover the site of the ancient city of Susa, and beds of large canals, supposed to be of Sassanian origin.

DESHA, a S. E. county of Arkansas, separated from Mississippi by the Mississippi river, and intersected by Arkansas and White rivers; area, about 600 sq. m.; pop. in 1870, 6,125, of whom 3,934 were colored. The area has recently been

diminished by the taking of a portion for Lincoln county. The surface is low, level, and subject to inundation. The chief productions in 1870 were 94,797 bushels of Indian corn, 11,387 of sweet potatoes, 7,041 of Irish potatoes, and 8,166 bales of cotton. There were 804 horses, 1,018 mules and asses, 1,397 milch cows, 2,811 other cattle, and 7,042 swine. Capital, Napoleon.

DESHOULIÈRES, Antoinette (DU LIGIER DE LA GARDE), a French authoress, born in Paris about 1634, died there, Feb. 17, 1694. She was the daughter of a *maître d'hôtel* of Maria de' Medici and Anne of Austria, and was early noted for beauty and wit. She began to write verses when very young. In 1651 she was married to Guillaume de la Fon de Boisguérin, seigneur des Houlières, who in the troubles of the Fronde embraced the party of the prince of Condé, and was exiled. She subsequently joined her husband at the court of Brussels, where she became an object of suspicion, and was imprisoned in 1657 in the castle of Vilvoorden, where she read the Scriptures and fathers of the church. She was rescued by her husband after eight months, and on her return to France after the amnesty became a favorite at the court of Anne of Austria. She wrote poems in almost all styles, from madrigal to tragedy; but her idyls, especially those entitled *Les moutons* and *Les fleurs*, were most admired, and gained her the appellation of the tenth muse and the French Calliope. The subsequent ill success of her tragedies caused this advice to be given her, *Retournez à vos moutons*. She became a member of the academy of the Ricovrati of Padua in 1684, and of the academy of Arles in 1689. Like Mme. de Sévigné, she belonged to the literary clique hostile to Racine. Voltaire said that of all French ladies who had cultivated poetry, Mme. Deshoulières had succeeded best, since more of her verses than those of any other were known by heart. The principal editions of her works are those of 1747 and 1799, each in 2 vols.

DESMAN, an insectivorous mammal of the shrew family, *mygale (galemys) Muscovitica* (Desm.). It is 7 in. long, with a tail of 8 in.; it is brown above and white below, the fur being very soft and long; the feet are webbed, and the flattened tail is covered with scales, and is a powerful rudder; the nose is lengthened into a flexible proboscis. It is found in the Volga and adjacent streams and lakes in S. E. Russia, making burrows in the banks, beginning under water, and ascending above the level of the highest floods. The food consists of small fishes, frogs, leeches, and larvæ of aquatic insects. It is itself devoured by pikes and other voracious fishes, to whose flesh it communicates a strong musky odor, from the penetrating secretions of glands near the tail. It is rarely seen on dry land; it is an excellent diver and swimmer, and, from its aquatic habits and the rodent look of the in-

cisor teeth, was formerly classed near the beaver; the teeth, however, are like those of the shrews, differing in having two very small ones between the two great incisors of the

Desman (*Mygale Pyrenaica*).

lower jaw, and in the two upper triangular and flattened incisors. The *M. (G.) Pyrenaica* is not much more than half the size of the Russian species; it is found in southern France, in the district of the Pyrenees.

DESMARRES, Louis Auguste, a French oculist, born in Evreux in 1810. He studied at the Sorbonne, and devoted himself entirely to the treatment of diseases of the eye, and soon acquired a great reputation. He has contributed largely to a better understanding of the pathology and anatomy of the eye, and invented an ophthalmoscope which is now in general use among practitioners. His *Mémoire sur une nouvelle méthode d'employer le nitrate d'argent dans quelques ophthalmies* (1842) and *Emploi de la belladonne dans les perforations de la cornée*, excited special attention; but his most important work is his *Traité théorique et pratique des maladies des yeux* (1847), which he considerably enlarged in subsequent editions, and which is considered a standard authority on the subject.

DESMIDIEÆ, minute algæ, or protophytes, which grow in fresh water, and whose forms present singularly beautiful appearances under the microscope. For a long time claimed both as animals and plants, they seem to stand on the limits of either kingdom. The controversy as to their true place has enlisted a great number of observers, who have submitted every fact to the most rigorous examination. Ehrenberg claimed them as animalcules; Dalrymple gave extended observations upon a single genus (*closterium*), which appeared to him to indicate animality; and Prof. Bailey and C. Eckhard arrive at the same conclusion. The latter derives his argument for their being animals partly from their motion, partly from their organization. Ehrenberg has not only given systematic descriptions of these questionable animals or plants, but his own observations, coupled with those of his predecessors, upon the nature of these bodies, will be found copiously detailed by him. It is, however, apparent

that all the facts known upon the subject are interpreted as if these creations were undoubtedly animals, while the same facts would bear a very different signification if we proceeded upon the supposition that they are plants. Meyen contended for the vegetable character of the desmidiæ, and was the first to detect starch in the cells; and the accuracy of his remarks was fully confirmed by Ralfs, Jenner, and other recent algologists. It is said that no starch is to be detected in the young cell, while upon the growth of the sporangium, or spore capsule, it appears and increases rapidly, as in the seeds of the higher plants, in which it generally abounds. Of all the circumstances which indicate the vegetable nature of the desmidiæ, this is the most important, since it can be so easily submitted to experiment. In certain cavities in *closterium* Dalrymple noticed a peculiar motion of molecules on which he laid some stress. This motion has been termed swarming, on account of the commotion which arises within the cell; as the disturbance increases, the cell opens, when the molecules, or rather germinative cells, dart about in every direction, until at length they settle down into repose. The presence and functions of these cells in plants of entirely differing families and groups, render their occurrence in those under consideration no evidence of their being animals. The desmidiæ resist decomposition, exhale oxygen on exposure to the sun, preserve the purity of the water containing them, and when burned do not emit the peculiar odor usually so characteristic of animal combustion. Berkeley, in his "Introduction to Cryptogamic Botany," remarks that if in some points there be anomalies, as in *closterium*, their whole history is so evidently vegetable, their mode of increase, growth, &c., that if we refuse them the title of vegetables, we may as well dispute that of the whole tribe of protophytes. The fact that under the influence of light they give out oxygen, added to the other characteristics, is quite convincing.—Considering the desmidiæ as vegetable productions, we find them peculiar for their beauty, variety of forms, and external markings and appendages. They are mostly of an herbaceous green color, and contain a green internal matter. The frond divides into two valves or segments, by a sort of voluntary action; a mode of growth in the bisection of cells that Meyen and others have proved to be frequent if not universal in the more simple algæ. In the desmidiæ the multiplication of the cells by repeated division is full of interest. The compressed and deeply constricted cells of *euastrum* offer most favorable opportunities for ascertaining the manner of this division; for although the frond is really a single cell, yet this cell in all its stages appears like two, the segments being always distinct. As the connecting portion is so small, and necessarily produces the new segments, which cannot arise from a broader base than its opening, these are at first very minute,

though they rapidly increase in size. The segments are separated by the elongation of the connecting tube, which is converted into two roundish hyaline lobules. These lobules increase in size, acquire color, and gradually put on the appearance of the older portions. Of course, as they increase, the original segments are pushed further asunder, and at length are disconnected, each taking with it a new segment to supply the place of that from which it has separated. All the desmidiæ are gelatinous. In some the mucus is condensed into a distinct and well defined hyaline sheath or covering; in others it is more attenuated, and the fact that it forms a covering is discerned only from its preventing the contact of the colored cells. In general, its quantity is merely sufficient to hold the fronds together in a kind

third generation acquire their regular form, which they may continue to propagate for years, without ever producing a true spore.—Very little is known respecting the uses of the desmidiæ. The food of bivalve mollusks belonging to fresh waters seems to be made up of them. They are found principally where there is some admixture of peat, and in clear pools rather than in running streams. They abound in open places, and are rarely seen in shady woods or in deep ditches. So numerous are the species and so diversified their shapes and characters, that they have been divided into distinct genera as natural series present themselves in turn. In the first of these series we discover the plant an elongated, jointed filament, which may be cylindrical, sub-cylindrical, triangular or quadrangular, plane with the margins even and smooth, or with the margins incised and sinuated. In *hyalotheca* we have the mucous envelope alluded to above, within which are numerous joints, which are usually broader than long; and as each has a shallow groove passing round it, it resembles a small pulley wheel. The minuteness of the plant may be estimated from the length of these joints, which vary from $\frac{1}{3105}$ to $\frac{1}{1331}$ of an inch. *H. dissiliens* (Bréb.) is found in North America as well as in Europe. In *desmidium* the joints are bidentate at the angles; the filament is fragile and of a pale green color; the length of the joint is from $\frac{1}{2000}$ to $\frac{1}{1600}$ of an inch. *D. Swartzii* (Ag.) is common throughout the United States. In *micrasterias* we have a simple, lenticular frond, deeply divided into two-lobed segments, each lobe incised-dentate and generally radiate. Many species of this beautiful plant are common in this country. The compressed bipartite and bivalved frond of the *xanthidium* is represented in the fossils by one that is globose and entire. The constriction about the middle of the frond is lost in *closterium*, which also differs in shape, it being crescent-like or arcuate. The species of this are common and numerous. The fronds of *ankistrodesmus* are aggregated into faggot-like bundles. *Pediastrum tetras*, occurring from Maine to Virginia, has an extremely minute frond composed of four cells, which make a star-like figure; while *P. biradiatum*, found in New Jersey as well as in Germany, has many more cells, yet still arranged in a stello-radiate manner.—In collecting the desmidiæ, the student must seek in proper situations the sediment observable in the form of a dirty cloud or greenish scum upon the stems and leaves of filiform aquatic plants. This is to be carefully transferred to a bottle of pure water, and thus he will secure many beautiful species for his microscope. If the bottle be exposed to the light, the little plants will continue in good condition, and thrive for several months.

DES MOINES, a S. E. county of Iowa, bordering on Illinois, washed by the Mississippi on the E., bounded S. by Skunk river, and

1. *Didymoprium Borrieri*, with the cells uniting to form the green matter. 2. *Micrasterias crenata*. 3. *Euastrum oblongum*. 4. *Xanthidium armatum*. 5. The same with a frond acquiring a new segment by division. 6. *Closterium lunula*. 7. *Pediastrum tetras*. 8. *Pediastrum biradiatum*. 9. *Ankistrodesmus falcatus*.

of filmy cloud, which is dispersed by the slightest touch. When they are left exposed by the evaporation of the water, this mucus becomes denser, and is apparently secreted in larger quantities to protect them from the effects of drought. Their normal mode of propagation seems to be by the production of single large spores or sporangia, which derive their existence from the union of the green coloring matter (endochromes) of two contiguous plants. This process is seen in the sketch of one of the species of *didymoprium*, in fig. 1 of the cut. These spores are mostly globular, although they exhibit a great variety of forms with reference to their external surfaces. Sometimes they bear no resemblance to the parent plant. But once formed, they are propagated by division, in the same manner as the ordinary cells, and in the

drained by Flint creek; area, 408 sq. m.; pop. in 1870, 27,256. Limestone and anthracite are the principal mineral productions. The surface is occupied by prairies and tracts of timber. The soil is fertile and well cultivated. The Burlington and Missouri River, the Burlington, Cedar Rapids, and Minnesota, and the Burlington and Southwestern railroads traverse it. The chief productions in 1870 were 211,234 bushels of wheat, 887,138 of Indian corn, 208,833 of oats, 98,269 of potatoes, 24,457 tons of hay, 478,878 lbs. of butter, and 69,859 of wool. There were 8,350 horses, 6,558 milch cows, 10,931 other cattle, and 15,426 sheep; 2 flour mills, 4 planing mills, 3 breweries, 3 manufactories of agricultural implements, 15 of carriages and wagons, 1 of cars, 3 of machinery, 2 of marble and stone work, 1 of linseed oil, 1 of sashes, doors, and blinds, 1 of tobacco and snuff, 4 of cigars, and 2 of woollen goods. Capital, Burlington.

DES MOINES, a city and the capital of Iowa and county seat of Polk county, situated at the head of steam navigation on Des Moines river, at its junction with the Raccoon, about 300 m. W. of Chicago; pop. in 1850, 502; in 1860, 3,965; in 1870, 12,035; in 1873, 15,061. The city is laid out in quadrilateral form, extending 4 m. E. and W. and 2 m. N. and S. The Des Moines, flowing from the north, divides it a little E. of the centre, and the portion W. of this river, commonly called the "West Side," is again divided S. of its centre by the Raccoon. From the confluence of the rivers, on either side, the ground rises gradually toward the city limits to a height of about 160 ft. • Enclosed by the rivers on the south and east is a plateau about 1 m. long and $\frac{1}{2}$ m. wide, with an average elevation of 15 ft. above high water, where are situated the post office, court house, and city offices, the principal depots and hotels, and the greater portion of the business houses. On the higher ground beyond are some of the finest private residences. E. of Des Moines river is another business locality. The portion of the West Side S. of Raccoon river is known as "South Park." Capital square, E. of the river, contains 10 acres, on an elevated site, commanding a fine view. The old capitol was erected by the city in 1856, at a cost of \$60,000. Provision was made by the legislature in 1869 for the erection of a new capitol, to cost \$1,500,000, of which the foundation has been laid. The post office, which accommodates also the United States courts, the land office, and other federal offices, was built in 1870, at a cost of over \$200,000. The driving park association possesses grounds, about 100 acres in extent, situated in a bend of Raccoon river, which are provided with suitable buildings for holding the state and county fairs, &c. A public park in the N. W. part of the city, containing 40 acres of native forest, has recently been set apart. The rivers are spanned by six bridges. The Chicago, Rock Island, and Pacific, and the Des Moines

Valley railroads intersect here. A branch of the former is in operation to Indianola and Winterset, and several other roads are in progress. Wood is abundant in the vicinity. There are also extensive coal mines, and deposits of fire clay, potters' clay, lime, &c. The city contains a woollen factory, several plough factories, scale works, an oil mill, founderies, flour mills, two national banks with a capital of \$200,000, and one life and two fire insurance companies. Gas works were constructed in 1865. Water works have been erected by a private corporation, with city aid; the water is obtained from Raccoon river, and is distributed through 10 m. of mains. Des Moines is divided into seven wards. There are five public school houses; the number of separate schools in 1872 was 22 (including a high school), having 24 teachers, and an average attendance of 1,018 pupils. The Baptists have a college, occupying a four-story brick building, 80 by 250 ft., situated on an eminence affording a fine view of the city and the valleys of the rivers. The state library contains about 15,000 volumes, and there is a public library with about 3,000 volumes. Three daily newspapers, six weekly, and six monthly periodicals are published here. There are 13 churches, viz.: Baptist, Christian, Congregational, Episcopal, Lutheran, Methodist (3), Presbyterian (3), Roman Catholic, and Universalist. The Spiritualists also have a society.—Des Moines was laid out in 1846, and incorporated as the town of Fort Des Moines in 1851. A city charter, giving it its present name, was granted in 1857, and the same year it became the capital of the state.

DES MOINES RIVER, the largest river in Iowa, formed by the junction of two branches, known as the E. and W. forks, which rise in a chain of small lakes in S. W. Minnesota, and flowing S. E. unite in Humboldt co., Iowa. From the junction it flows S. E. through the middle of the state, and joins the Mississippi at the S. E. corner, about 4 m. below Keokuk, having for a short distance formed the boundary between Iowa on the N. E. and Missouri on the S. W. In its course of 300 m. the Des Moines drains 10,000 sq. m. in Iowa, passing through an undulating, fertile region, interspersed with tracts of prairie, rich in coal, and abounding in timber. There are many excellent mill sites along its banks. The fall from Fort Dodge, Webster co., to Ottumwa, Wapello co., is 2 ft. 4 in. per mile, and from Ottumwa to its mouth, 1 ft. 11 in. per mile. Many towns have sprung up along its banks, among which is Des Moines, the state capital. The principal tributaries from the west are the Raccoon, or Coon river, and North, Middle, and South rivers; the largest E. branch is the Boone, which rises in Kossuth and Hancock counties. Raccoon river rises in Buena Vista co., receives several tributaries, and empties into the Des Moines at the city of the same name. An appropriation of lands to improve the naviga-

tion of the Des Moines was made by congress, but it was afterward diverted to the construction of the Des Moines Valley railroad. Before the diversion, however, a number of dams had been built in the lower part of the stream, which afford good water power.

DESMOND, Earls of, an ancient family of great influence in S. W. Ireland, between 1329 and 1583. The line numbered 15 earls. The title and family are now extinct. Before the English gained a footing in Ireland, the kingdom of Cork was a separate sovereignty, embracing much of the present province of Munster. It was divided into Desmond or South Munster, Muskerry or West Munster, and Carbery in the southwest. In 1172 Dermot MacCarthy, king of Cork, swore fealty to Henry II., but soon afterward broke his plight and attacked his liege's forces. He was overpowered, and Henry in 1177 bestowed the kingdom on Robert Fitz Stephen and Milo de Cogan. Cogan's share, falling ultimately to co-heiresses, was divided between Robert Carew, Patrick Courcey, and Maurice Fitz Thomas. The last was created by the English monarch earl of Desmond in 1329. By aggressions on the lands of Courcey and Carew, and by other acquisitions, the estates of the Desmonds so increased that the 8th earl was possessor of almost the whole of the former kingdom of Cork. He exercised rights of sovereignty with such a high hand that he was attainted of treason, and beheaded at Drogheda, Feb. 15, 1467. His estates, being suffered to remain in his family, continued to augment until Gerald, the last earl, owned a territory extending 150 miles through the counties of Waterford, Cork, Kerry, and Limerick, and comprising 500,000 acres. These earls never yielded more than a nominal allegiance to the English crown. The country of the Desmonds was Irish in language, habits, and religion. Hence it was deemed a favorable locality by Philip II. of Spain, in his war with Queen Elizabeth, to attempt the conquest of Ireland. Accordingly, on July 1, 1578, a body of Italian troops, under the command of James Fitz Maurice, brother of the earl of Desmond, and accompanied by Saunders, the pope's legate, landed in the Desmond country, where they were immediately joined by Sir John of Desmond and James Fitzgerald, other brothers of the earl. At first Earl Desmond made some show of resistance, but subsided at length into neutrality. On this, Lord Justice Pelham summoned him to surrender his castles to the queen. Desmond refused, whereon he and all of his name were proclaimed traitors, Nov. 1, 1579. Desmond now summoned his people to support the Catholic cause, and his dependants responded to the call. He seized on the town of Youghal, and until November, 1583, maintained a determined warfare. Being by that time driven from his strongholds, one after another, he wandered over the country for months, and was at last killed in a cabin where he had

taken shelter. His estates were divided among the captains of Elizabeth's army. Sir Walter Raleigh received 20,000 acres, which he sold cheaply to Richard Boyle, afterward earl of Cork.—**JEANNE FITZGERALD**, wife of James, 14th earl, is said to have lived to an age exceeding 140 years. Her husband presented her at the court of Edward IV., where she danced with the duke of Gloucester, afterward Richard III.; she was widowed during the reign of Edward IV., and died in the reign of James I., some time after 1603. At the age of 140 she travelled from her home at Inchiquin, Ireland, by the way of Bristol, to London, to urge some claim against the government. At that time she was quite vivacious and in possession of all her faculties. Sir Walter Raleigh says, "I myself knew her." ("History of the World," book i, ch. 5.) Bacon mentions that the old countess of Desmond had thrice renewed her teeth. Recent investigators, however, have thrown much doubt on her alleged great age.

DESMOULINS, Benoît Camille, a French revolutionist, born at Guise in Picardy in 1760, guillotined in Paris, April 5, 1794. He studied law in Paris, but never practised. On the eve of the revolution he published two republican pamphlets, *La philosophie au peuple français* (1788), and *La France libre* (1789); and when the revolution broke out he ardently adopted its principles, and became one of the favorite orators of the crowd which gathered at the Palais Royal to hear the news of the day. On July 12, 1789, the day after the dismissal of Necker, he mounted a table in the garden of the palais and called the people to the defence of their threatened liberty; he declared that he would not be deterred from speaking by fear of the police, and with a loaded pistol in each hand swore that he would not be taken alive. He advised the patriots to wear a green badge, and as there was not a sufficient quantity of ribbon, he gave them the green leaves of the trees in the garden. The cry "To arms!" was raised; the crowd seized upon all the arms they could find at the gunsmiths', and forming in procession carried through the streets the bust of the dismissed minister with that of the then popular duke of Orleans. The next day the muskets and cannon at the Invalides fell into the hands of the people, and on the 14th the Bastille was taken. Camille, who had given impulse to this insurrection, figured among the combatants, and at once gained popularity. This was enhanced by a pamphlet, *La lanterne aux Parisiens*, in which he styled himself the "attorney general of the lamp post." Its success encouraged him to commence, under the title of *Les révolutions de France et de Brabant*, a newspaper which exercised great influence by its vigor of thought, sparkling wit, and lively style. Such was its importance that Mirabeau sought to conciliate its editor. Camille had been a schoolmate of Robespierre, and lived on

intimate terms with the future dictator of the revolution. He was also acquainted with Marat. But his bosom friend was Danton, who largely controlled the young and brilliant writer. Their destinies were closely connected from the establishment of the club of the Cordeliers. Camille was instrumental in the insurrection of Aug. 10, 1792, and was appointed secretary to the ministry of justice when Danton received that office from the legislative assembly. In the massacre of September he used his influence to preserve the lives of several intended victims. With Danton he was elected to the national convention. In the contest between the Girondists and the Montagnards, he contributed to bring the former into contempt by his *Histoire des Brissotins*, a pamphlet in which ridicule was skillfully blended with serious charges. He was satisfied with the fall of the party, and would have saved the individuals of whom it was composed, but this was beyond his power. Both he and Danton now tried to bring the convention to a milder policy, and toward the end of January, 1794, Camille established a journal, *Le vieux Cordelier*, in which he advocated conciliatory measures. Denouncing the system of proscription, he demanded the establishment of a committee of clemency as a preliminary step to clearing the prisons of the suspected. This was answered by accusations brought against him in the club of the Jacobins. Robespierre defended his old friend on two occasions; he represented Camille as a wayward child, whose person it was not necessary to injure, but demanded that his writings should be burned. "To burn is not to answer," exclaimed the headlong journalist; and from that day his fate was sealed. He was arrested on the same night with Danton (March 30), arraigned with him before the revolutionary tribunal, and, without a hearing, was sentenced to death. When asked his age, he replied, *Trente-trois ans, l'âge du sans-culotte Jésus, l'âge funeste aux révolutionnaires*. On their way to the scaffold, while Danton stood composed and immovable, Camille became almost frantic, struggling with his bonds, and appealing to the people. His friend vainly motioned him to keep quiet; he continued to address the crowd, and recalled to their memory all that he had done in their service. "Behold," he cried in despair, "behold the recompense reserved to the first apostle of the revolution!" His young and beautiful wife, who had vainly implored his pardon from the old friendship of Robespierre, tried to raise a riot to save him, but she was arrested, and suffered death a few days later. Camille Desmoulins holds high rank as a pamphleteer. His *Vieux Cordelier* was reprinted in 1833.

DESNA, a river of Russia, which rises in the government of Smolensk, flows through those of Orel and Tchernigov, and falls into the Dnieper a few miles above Kiev. It is a fine stream, abounding in fish, and navigable

for the greater part of its course of about 500 miles.

DESNOYERS, **Auguste Gaspard Louis Boucher**, baron, a French engraver, born in Paris, Dec. 20, 1779, died there, Feb. 15, 1857. At the age of 20 he received a prize of 2,000 francs for an engraving of Venus disarming Cupid, and in 1801 established his reputation by the reproduction of Raphael's "Beautiful Gardener," in the gallery of the Luxembourg. His most admired productions are copies of Raphael's works, and prominent among them is an engraving of the "Transfiguration." He was elected a member of the institute in 1816, appointed chief engraver to the king in 1825, created baron in 1828, and officer of the legion of honor in 1835.

DESOR, **Edward**, a Swiss geologist and naturalist, born at Friedrichsdorf, Hesse-Homburg, Feb. 11, 1811. He studied law at Giessen and Heidelberg, was compromised in the republican movements of 1832-'3, and escaped to Paris. Here his attention was drawn to geology; he made excursions with Elie de Beaumont, and in 1837 met Agassiz at a meeting of naturalists in Neuchâtel, and with Gressli and Vogt became his active collaborator, contributing the essays for vol. iii. of his *Monographie d'échinodermes vivants et fossiles* (Neuchâtel, 1842). He also published *Excursions et séjours dans les glaciers et les hautes régions des Alpes de M. Agassiz et de ses compagnons de voyage* (Neuchâtel, 1844). After spending a few years in the north of Europe, especially in Scandinavia, investigating the erratic phenomena peculiar to that region, he accompanied Agassiz in 1847 to the United States, found employment in the coast survey, and made with Whitney, Foster, and Rogers a geological survey of the mineral district of Lake Superior. Returning to Neuchâtel in 1852, he investigated with Gressli the orography of the Jura for industrial purposes, and was appointed professor of geology. He published subsequently *Geologische Beschreibung der neuchâtelers Jura* (with Gressli); *Synopsis des échinides fossiles* (Paris, 1857-'9); and *De l'orographie des Alpes dans ses rapports avec la géologie* (Neuchâtel, 1862). Having been made a citizen of the community of Ponts, he was elected a member of the cantonal grand council, of which he became president. In the winter of 1863 he visited Algeria and the Sahara, and published *Aus Sahara und Atlas* (Leipsic, 1865). The discovery of the lake dwellings induced him to pursue the study of archæology, and the results of his researches are given in *Les palafittes, ou constructions lacustres du lac de Neuchâtel* (Paris, 1865; German, Leipsic, 1866). The most important of his recent publications is *Echinologie helvétique* (Paris, 1869-'71), prepared in conjunction with Loriol.

DE SOTO. **L. A. N. W.** county of Mississippi, bordering on Tennessee, and bounded N. W. by the Mississippi river; area, 960 sq. m.; pop.

in 1870, 32,021, of whom 17,745 were colored. The surface is generally level, and occupied chiefly by cotton plantations. There are extensive swamps in the W. part. The Mississippi and Tennessee railroad crosses it. The chief productions in 1870 were 25,048 bushels of wheat, 741,363 of Indian corn, 72,977 of sweet potatoes, 191,543 lbs. of butter, and 24,118 bales of cotton. There were 4,359 horses, 4,468 mules and asses, 6,648 milch cows, 10,334 other cattle, 4,760 sheep, and 36,315 swine. Capital, Hernando. **II.** A N. W. parish of Louisiana, bordering on Texas, drained by Red and Sabine rivers; area, 910 sq. m.; pop. in 1870, 14,962, of whom 9,851 were colored. By means of the Red river it has steamboat communication with New Orleans. The chief productions in 1870 were 321,365 bushels of Indian corn, and 15,809 bales of cotton. There were 1,334 horses, 1,618 mules and asses, 3,110 milch cows, 8,221 other cattle, 4,906 sheep, and 8,620 swine; 7 saw mills and 4 manufactories of carriages and wagons. Capital, Mansfield.

DE SOTO, Fernando, a Spanish explorer, born at Xeres de los Caballeros, in Estremadura, about 1496, died on the banks of the Mississippi in 1542. Of a noble but reduced family, he was enabled by the favor of Pedrarias Davila to spend several years at one of the universities, and distinguished himself in literary studies, and especially in athletic accomplishments. In 1519 he accompanied his patron on his second expedition to America as governor of Darien, and was the most intrepid opponent of the oppressive administration of that officer. He supported Hernandez in Nicaragua in 1527, who perished by the hand of Davila in consequence of not heeding his advice. Withdrawing from the service of Davila, he explored in 1528 the coast of Guatemala and Yucatan for 700 m., in search of the strait which was supposed to connect the two oceans. In 1532 De Soto joined Pizarro in his enterprise for conquering Peru. Being sent in 1533, with 50 horsemen and a few targeteers, to explore the highlands of Peru, he penetrated through a pass in the mountains, and discovered the great national road which led to the Peruvian capital, and was soon after selected by Pizarro to visit the inca Atahualpa as ambassador. After the capture of the inca, and when the latter had paid an immense sum for ransom, De Soto in vain expostulated with Pizarro for treacherously refusing to release the Peruvian monarch. He was prominent in the engagements which completed the conquest of Peru, and was the hero of the battle which resulted in the capture of Cuzco, the metropolis. He soon after returned to Spain with a fortune of \$500,000, met a flattering reception from the emperor Charles V., made a splendid display at court, and married the daughter of Davila, to whom he had been long attached. In 1536 the belief was entertained that in the vast region then called Florida was a new El

Dorado, richer than any that had been discovered. De Soto proposed to the emperor to undertake the conquest of Florida at his own expense; and the privilege being conceded to him, many Spanish and Portuguese cavaliers enrolled themselves among his followers. With 600 men, 24 ecclesiastics, and 20 officers, he sailed from San Lúcar early in April, 1538. After stopping at Santiago de Cuba, and then at Havana, where it was decided that the ladies attached to the expedition should remain till after the conquest of Florida, he crossed the gulf of Mexico, and anchored in the bay of Espiritu Santo (Tampa bay), May 25, 1539. His route was through a country already made hostile by the violence of the Spanish invader Narvaez, and he was constantly deluded by the Indians, whose policy it was to send their unwelcome visitors as far away as possible by telling them of gold regions at remote points. A Spaniard, Juan Ortiz, who had been in slavery here from the time of Narvaez, served as his interpreter. In July, 1539, he sent back all his ships to Havana. He passed the first winter in the country of the Appalachians, E. of the Flint river. Directed then to the northeast, he reached in April, 1540, the Ogeechee; thence proceeding S., he reached the Coosa, and on Oct. 18 the village of Mavilla or Mobile, on the Alabama. In an engagement with the natives here the loss of the Spaniards was 80 men and 42 horses; that of the Indians was reported at 2,500 men. He passed the second winter in the country of the Chickasaws, who in the spring burned his camp and their own village, when he attempted to force them to carry his baggage; 40 Spaniards perished in the flames and in the night attack. Soon after beginning his march to the northwest a pestilential fever carried off nearly a score of his men. He reached the Mississippi after journeying seven days through forests and marshes, was nearly a month in constructing eight barges to transport his army, and having crossed the river went N. to Pacaha, where he remained from June 19 to July 29. Thence he marched successively S. W. and N. W. till he reached the highlands of the White river. This was the western limit of his expedition. He then proceeded S. by the hot springs of Arkansas, and made his third winter station at Autiamque on the Washita river. In March and April, 1542, he continued S. along the Washita to the Mississippi, and while attempting to descend the banks of the latter river he was attacked with fever and died, after appointing Luis de Moscoso his successor. The day of his death is variously given as May 21 and June 5 and 25. To conceal his death, his body was wrapped in a mantle and sunk at midnight in the middle of the stream. His followers, reduced more than one half in number, venturing east, were driven backward to the river, where they passed the next winter. In the spring of 1543 they embarked in seven boats, and after nearly three months the survivors reached the Mexi-

can town of Panuco, where they dispersed. De Soto's wife expired at Havana on the third day after learning his fate.

DESPARD, Edward Marcus, an Irish soldier, born about 1755, beheaded in London, Feb. 21, 1803. He was a native of Queen's county, Ireland, served in the army with credit, and reached the rank of lieutenant colonel. He was superintendent of the English colony in Honduras, and in consequence of complaints against him was recalled in 1790, but could never procure an examination into his administration. This made him disaffected, and he was arrested for seditious conduct; but after his liberation he was only the more inflamed. In conjunction with some privates of the guards and a number of workmen he formed a plan to seize the tower and the bank, and to assassinate the king on his way to open parliament. The conspirators were tried by special commission at Southwark, Feb. 5, 1803, and Despard and nine of his associates suffered death.

DES PLAINES, or *Aux Plaines* (Indian appellation, *She-shik-mah-o*), a river of Illinois, rising in the S. E. part of Wisconsin, flowing S. and S. W., and uniting with the Kankakee at Dresden, Grundy co., to form the Illinois. It is about 150 m. long, and derives its name from a species of maple called by the French *plaine*.

DESSAIX, Joseph Marie, a French general, born in Thonon, Savoy, Sept. 24, 1764, died Oct. 26, 1834. He studied medicine at Turin and commenced practice in Paris, but returned to Savoy in 1791, organized an association to propagate democratic principles, and was made captain of a corps of volunteers formed by this association. He served at the siege of Toulon, and in Italy under Bonaparte; was elected in 1798 to the council of 500, where he opposed the *coup d'état* of the 18th Brumaire; made a brigadier general by Bonaparte in 1803, and, in the campaign of 1809 against Austria, a general of division, receiving from the emperor the surname of *l'Intrépide* and the title of count of the empire. Being wounded during the expedition to Russia, he was put in command of the city of Berlin, and in 1813 was intrusted with the defence of France on the line of the Alps. In 1814 he was kindly treated by the Bourbons, notwithstanding which he joined the standard of Napoleon after his landing at Cannes, and was imprisoned six months in 1816. After the revolution of 1830 he was elected commander of the national guard at Lyons.

DESSALINES, Jean Jacques, emperor of Hayti, born in W. Africa about 1760, killed Oct. 17, 1806. He was brought to Hayti as a slave, and adopted the name of his master. The repeal, Sept. 24, 1791, of the rights of citizenship conferred on people of color by the French national assembly, was followed by a contest between the mulattoes and the planters. During this conflict Dessalines served under Jean François on the side of the mulattoes. The commissioners of the French convention having in August, 1793, proclaimed universal freedom, Toussaint

l'Ouverture went over to their side. Dessalines followed his fortunes, was made successively colonel and brigadier general, and played an important part in the expulsion of the English from the island. Gen. Leclerc having been sent by Napoleon to Hayti to reëstablish slavery, the negroes on his arrival in 1802 took up arms, and Dessalines was made general of division and placed in command of the department of the west. One of his most remarkable feats during the campaign which followed was the defence of the town of St. Marc against Gen. Boudet. When unable to hold out any longer he burned the town, setting fire with his own hand to a palace which he had just constructed for himself. Though obliged to retreat, he kept up the fight for a considerable time, but was finally forced to surrender. A truce was concluded, May 1, 1802, and while it was still in force Toussaint l'Ouverture was seized and carried to France. The negroes thereupon renewed the conflict, and Dessalines was made commander-in-chief. The French army was attacked by the yellow fever; Leclerc died; and the French were compelled to evacuate the island. Hayti proclaimed its independence, Jan. 1, 1804, and Dessalines was appointed governor general for life. He issued a proclamation in which he rehearsed the grievances Hayti had suffered from the French, and undertook to exterminate the whites who still remained upon the island. On Oct. 8, 1804, he had himself crowned as emperor of Hayti, assuming the title of Jean Jacques I. A constitution was adopted, and he seemed for a time anxious to promote the welfare of his people, and put forth several schemes for the encouragement of immigration of negroes from the United States and Jamaica. But he soon relapsed into cruelty; a conspiracy was formed against him, and he fell into an ambuscade and was killed. He had great courage and considerable military ability, but in other respects was little more than an ignorant savage, and proved himself one of the most brutal and bloodthirsty monsters that ever wielded power over their fellows.

DESSAU, a city of Germany, capital of the duchy of Anhalt, on the river Mulde, 2 m. from its junction with the Elbe, and 67 m. S. W. of Berlin; pop. in 1871, 17,464. It is the ducal residence, and has a fine park and a picture gallery. The theatre, the palace of the hereditary prince, the council house, the castle church, the government building, the gymnasium, St. Mary's church with some pictures by Lucas Cranach the younger, and the fine cemetery, are the most attractive features of the town. There are many scientific, artistic, religious, and industrial institutions and societies, a commercial school, a high school for girls, a ducal library containing about 25,000 volumes, an orthopaedic institution, and a bank with a capital of about \$2,000,000. The manufactures embrace woollen, linen, and cotton fabrics, musical instruments, hats, leather, and tobacco.

An important wool market is held here, and a flourishing trade in grain and other produce is carried on. Its environs are adorned with beautiful gardens, which have been reclaimed from sandy wastes.—Dessau was noted as early as 1213, and in 1313 had a school independent of the church. It was destroyed by fire in 1467. In the German revolution of 1848 it was one of the most democratic cities of Germany.

DESSOLLES, or **Bessolle**, **Jean Joseph Paul Augustin**, marquis, a French soldier and statesman, born at Auch, Oct. 3, 1767, died near Paris, Nov. 4, 1828. He early entered the army, was captain in the mountain legion in 1792, provisional adjutant on the staff of the army of the western Pyrenees in June, 1793, and chief of staff in October, and served in the Italian campaign under Bonaparte. He was appointed brigadier general May 31, 1797, commanded successfully against the Austrians in the Valtellina in 1799, and was promoted April 13 to the rank of division general. He took part in the battles of Novi, Möskirch, Biberach, Neuburg, and Hohenlinden. After the peace of Lunéville in 1801 he was made councillor of state and became provisional commander of the army of Hanover. In 1805 he was made governor of the château of Versailles. He became commander of a division of the army in Spain in 1808, occupied Cordova in January, 1810, and was made military governor of the city. On April 2, 1814, he received from the provisional government the command of the national guard of Paris, and contributed largely to the decision of the allies in favor of the Bourbons. On the arrival of the count d'Artois at Paris Dessolles was made a member of the provisional council of state, and upon the organization of the government he was appointed minister of state and major general of the national guards, and a peer of France. Upon the return of Napoleon he took the most energetic measures against him. During the hundred days he remained in retirement, and upon the return of the Bourbons resumed command of the national guards, but soon resigned. He was afterward minister of foreign affairs, and was elected president of the council of ministers Dec. 23, 1818. At the same time he was made a marquis. He opposed in the council the proposed change in the law of elections in 1819, and in November resigned, with the two ministers who shared his views.

DESTERRO, **Nossa Senhora do Desterro**, or **Santa Catharina**, a city of Brazil, capital of the province of Santa Catharina, on the W. coast of the island of that name, in lat. 27° 30' S., lon. 48° 30' W., 465 m. S. S. W. of Rio de Janeiro; pop. about 8,000. The city is on a tongue of land projecting into the bay, and is defended by two forts. It has many well built residences, but the streets are very irregular and badly paved. The public buildings are nearly all ill constructed and unsightly. Next to that of Rio de Janeiro, the harbor is the best on the coast; but its situation on an island is a serious disadvan-

tage. A thunder storm and water spout in 1838 destroyed a considerable portion of the town.

DESTOUCHES, **Philippe Néricault**, a French dramatist, born in Tours in 1680, died July 4, 1754. After leading an adventurous life with a company of strolling players, he was entertained at Lausanne by M. de Puisieux, the French envoy to Switzerland. His first comedy, *Le curieux impertinent*, was performed there with great applause in 1710, and was scarcely less successful when it appeared at Paris. Some other plays of his, among them *L'Irrésolu*, attracted the attention of the regent duke of Orleans, who employed him in several foreign missions. After his return from London in 1723, on the death of the regent, he retired to his country seat near Melun, where he wrote a number of comedies, the best of which are *Le philosophe marié* and *Le glorieux*, performed with great success in 1727 and 1732. In his later years he devoted himself to theology, and published several essays against infidelity. His collected works were published in 1750, in 4 vols. 4to.

DESTUTT DE TRACY. **I. Antoine Louis Claude**, count de Tracy, a French philosopher, born at Paray-le-Frésil, near Moulins, Bourbonnais, July 20, 1754, died at Auteuil, March 9, 1836. At the desire of his father, who was a general, he entered the army, and was a colonel at the outbreak of the revolution. He was a member of the provincial assembly of Bourbonnais, and was elected as delegate of the nobility to the states general, Jan. 24, 1789. Here he was a leader in reform measures, attacking the monarchy and the privileges of the nobility. Upon the dissolution of the assembly he retired to his estate at Auteuil; but in 1792 he was appointed *maréchal de camp* and joined the army under Lafayette, with whose moderate views he fully sympathized. After the events of Aug. 10 he followed him beyond the frontier, but soon returned privately to France, where he was arrested Nov. 2, 1793, and imprisoned till some time after the death of Robespierre. During this time he developed a taste for metaphysics, and became known as a philosopher. He was a member of the national institute from its formation, and as secretary of the committee of public instruction helped reorganize the public schools. After the 18th Brumaire he was made one of the first senators. In 1814 he voted for the fall of the empire, and entered the royalist chamber of peers; he protested against the reactionary measures of 1815. The departure of the national policy from his views, together with bereavement and personal sickness, brought upon him in old age a profound melancholy, and he became almost blind. He was a disciple of Condillac, and with clear and earnest convictions carried his materialism to its last extreme. His *Grammaire générale* (Paris, 1803) applies his philosophy to the analysis of language; his *Logique* (1805) applies it to the rules of reasoning, and has been considered a masterpiece;

and his *Traité de la volonté* (1815) applies it to the motives and results of our actions. These different parts of his system he afterward united under the title *Éléments d'idéologie* (4 vols. 8vo, 1817-'18). His *Commentaire sur l'Esprit des lois* he sent (before its publication in 1819) to President Jefferson, who translated it for a college text book (published in Philadelphia, 1811). Among his other works are *Quels sont les moyens de fonder la morale chez un peuple?* (Paris, 1798), and *Observations sur le système actuel de l'instruction publique* (1801). II. **Alexandre César Victor Charles**, marquis de Tracy, son of the preceding, born in Paris, Sept. 9, 1781, died at Paray-le-Frésil, Allier, March 13, 1864. He served in Napoleon's campaigns, became colonel in 1814, and retired in 1820. He was afterward for many years member of the chamber of deputies, distinguishing himself as an earnest liberal, and was minister of marine under Louis Napoleon from December, 1848, to October, 1849, when he joined the opposition. He protested against the *coup d'état* of Dec. 2, 1851, and retired to his estate at Paray. He was the author of *Lettres sur la vie rurale* (1861; previously published as *Lettres sur l'agriculture*, 1857). III. **Sarah Newton**, marchioness de Tracy, wife of the preceding, born at Stockport, England, Nov. 30, 1789, died at Paray-le-Frésil, Oct. 26, 1850. She was great-grand-niece of Sir Isaac Newton, and was brought to France in 1790. At the time of her marriage with the marquis de Tracy (1816) she was the widow of Gen. Letort. Wishing to settle her religious convictions, she studied patristic Latin, and left writings which were published after her death, under the title of *Essais divers, lettres et pensées de Mme. de Tracy* (3 vols., 1852-'5), only 150 copies being printed.

DETAILLE, Jean Baptiste Edouard. See p. 801.

DETMOLD, a city of Germany, capital of the principality of Lippe-Detmold, on the right bank of the river Werre, 46 m. S. W. of Hanover; pop. in 1871, 6,469. The old portion of the town is very poorly built; the new is regularly laid out and well built. It is surrounded by a wall pierced by three gates, and contains a fine palace of ancient date. It has a gymnasium, a normal school, a female high school, a large public library, and one of the best poorhouses in Germany. The manufactures are chiefly of leather, woollens, linen, and beer; and there are marble and gypsum quarries. Near the town was fought the battle in which Arminius destroyed the Roman army under Varus, A. D. 9; and also a battle between Charlemagne and the Saxons in 783. The former is commemorated by a copper statue 45 ft. high on a pedestal of solid sandstone 90 ft. high, erected by the German princes in 1838.

DETROIT (Fr. *détroit*, the narrows), a port of entry and the chief city of Michigan, capital of Wayne co., situated on the N. W. side of Detroit river, about 7 m. from Lake St. Clair, and 18 m. from Lake Erie, 80 m. E. S. E. of

Lansing, 225 m. W. by S. of Buffalo, and 250 m. E. by N. of Chicago; lat. 42° 20' N. lon. 82° 58' W. The city extends along the bank of the river about 7 m., and is built up for about 2½ m. from the water. For at least 6 m. the river front is lined with mills, dry docks, ship yards, founderies, grain elevators, railway depots, and warehouses. The ground on which the principal part of the city is built rises gradually from the river to the height of from 20 to 30 ft., at a distance of 15 to 30 rods from the shore; it then sinks slightly, and again rises gradually to the height of 40 to 50 ft. above the river. The river here is about ½ m. wide, and has an average depth of about 32 ft., and a velocity of about 2 m. an hour. It gives to the city the best harbor on the great lakes. Fort Wayne, about a mile below, commands the channel. Belle Isle, at the head of the river, is a favorite resort for picnics. Grosse Pointe, projecting into Lake St. Clair a few miles above the city, is noted for its cherry orchards, and is the terminus of a beautiful drive. Grosse Isle, near Lake Erie, contains many fine residences. Put-in-Bay island, in the lake, near the mouth of the river, famous as the scene of Perry's victory, Sept. 10, 1813, has become a summer resort. The population of Detroit has been as follows: in 1810, 770; 1820, 1,442; 1830, 2,222; 1840, 9,102; 1850, 21,019; 1860, 45,619; 1870, 79,577, of whom 35,381 were foreign born and 2,235 colored. Of the foreigners, 12,647 were natives of Germany, 7,724 of British America, 6,970 of Ireland, 3,284 of England, 1,637 of Scotland, and 670 of France. There were 4,969 persons, 10 years old and over, who could not write, of whom 4,117 were foreigners. There were 15,636 families and 14,688 dwellings.—Detroit is laid out upon two plans: the one, that of a circle with avenues radiating from the Grand Circus as a centre; the other, that of streets crossing each other at right angles; the result of which is a slight intricacy in certain quarters, and a number of small triangular parks. The avenues are generally 100, 120, or 200 ft. wide. The streets vary in width from 50 to 100 ft., and are for the most part abundantly shaded with trees. The principal streets are Jefferson avenue, parallel with the river; Woodward avenue, which crosses the former at right angles, and divides the city into two nearly equal parts; and Fort street, Michigan avenue, Grand River avenue, and Gratiot street, at various angles with Woodward avenue. West Fort street and Lafayette avenue are handsome streets. The Grand Circus, the principal park, is semicircular, and is divided by Woodward avenue into two quadrants, each containing a fountain. The Campus Martius, about ½ m. from the Grand Circus, is an open space 600 ft. long and 250 ft. wide, which is crossed by Woodward and Michigan avenues, and from which radiate Monroe avenue and Fort street. Facing the Campus Martius on the west is the new city hall, a handsome structure 200 ft. long, 90 ft.

wide, 66 ft. high to the cornice, and 180 ft. to the top of the tower, completed in 1871 at a cost of \$600,000. It is built of sandstone, in the Italian style, and consists of three stories above the basement, with a Mansard roof. In the square fronting the city hall stands a monument in memory of the Michigan soldiers who fell in the civil war. Facing the Campus Martius on the north is the opera house, one of the largest and finest edifices of the kind in the country. The custom house, which also contains the post office, is a large stone building in Griswold street. The board of trade has a handsome building near the river. The Roman Catholic cathedral is the largest church edifice in the city. St. Paul's church (Episcopal) is noted for its self-sustaining roof, and the central Methodist and Fort street Presbyterian churches are fine specimens of architec-

ture. The convent of the ladies of the Sacred Heart, in Jefferson avenue, is a large and beautiful building. One of the most noteworthy structures is the Michigan Central freight depot, 1,250 ft. long and 102 ft. wide, consisting of a single room, covered by a self-sustaining roof of corrugated iron. Near it is the great wheat elevator of the company, the cupola of which commands a fine view. The principal cemeteries are Woodmere, on high ground 4 m. W. of the city; Elmwood, 2 m. E. of the centre of the city; and Mt. Elliot (Catholic), adjoining Elmwood; besides which there are a Lutheran and four Jewish cemeteries. Eight lines of railroad radiate from Detroit, viz.: the Michigan Central, extending to Chicago; the Lake Shore and Michigan Southern, to Buffalo and Chicago; the Detroit and Milwaukee, to Grand Haven; the Great Western of Canada, to

Detroit.

Niagara Falls; the Grand Trunk to Portland, Me.; the Detroit, Lansing, and Lake Michigan, to Howard City; the Detroit and Bay City, between those places; and the Canada Southern. Eight lines of street railroad, with more than 40 m. of track, intersect the city, and three lines of ferry boats ply across the river to Windsor on the Canadian side. There are seven steamboat lines, with 70 boats running to various points on the lakes.—The foreign commerce of Detroit, as shown by the report of the bureau of statistics, is exclusively with Canada, though a few vessels have loaded direct for Liverpool. For the year ending June 30, 1873, the imports amounted to \$1,900,228, the exports to \$2,818,408. There were entered and cleared 1,949 American vessels of 307,760 tons, and 1,522 foreign vessels of 489,596 tons. In the coastwise trade the entries were 1,184 steam vessels of 581,243 tons, and 2,022 sailing

vessels of 203,666 tons; clearances, 1,174 steam vessels of 568,131 tons, and 2,056 sailing vessels of 204,995 tons. There were 365 vessels of 78,546 tons belonging to the port; of which 188, of 27,828 tons, were sailing vessels; 120, of 35,849 tons, steamers; and 57, of 14,869 tons, barges; 17 vessels, of 4,180 tons, were built during the year. The imports from Canada included 33,672 bushels of barley, 40,478 of peas and beans, 629,101 lbs. of fresh fish, 53,456 dozen of eggs, and \$171,584 worth of wood. The exports consist chiefly of Indian corn, oats, wheat, lumber, railroad cars, cotton, hogs, bacon, ham, and lard. The domestic trade is important, large quantities of produce, chiefly from Michigan, passing eastward through the city. The following table exhibits the receipts, almost wholly by rail, for four years, of the principal articles of commerce, exclusive of those in transit not reshipped:

ARTICLES.	AMOUNTS.			
	1870.	1871.	1872.	1873.
Flour, bbls.....	730,513	783,763	667,906	495,509
Wheat, bushels...	2,127,473	3,599,685	3,381,274	2,675,719
Corn, bushels.....	411,033	1,152,585	1,646,722	1,755,519
Oats, bushels.....	436,018	1,617,276	1,040,303	1,362,581
Barley, bushels....	378,029	364,339	363,652	395,725
Butter, lbs.....	1,566,141	2,401,658	2,291,042
Hides, lbs.....	5,157,760	4,692,334	4,773,095	3,092,250
Hops, lbs.....	243,613	246,576	203,250
Dressed hogs, lbs.	6,616,551	11,533,066	8,914,359
Pork and lard, lbs.	890,435	1,084,213
Lard, lbs.....	693,266	4,803,674	4,362,555
Cured meats, lbs..	1,607,631	10,915,006	9,247,031
Beef, lbs.....	307,995	603,749	404,759
Pork, bbls.....	7,507	15,510	8,512
Wool, lbs.....	5,592,917	5,974,186	5,245,256	4,969,013
Cattle, number....	50,639	100,085	72,572	86,178
Hogs, number.....	135,535	423,483	755,979	777,106
Sheep, number....	149,961	163,135	166,592	176,584

The amount of flour and grain in store Jan. 1, 1874, was: 4,850 bbls. of flour, 106,618 bushels of wheat, 39,718 of corn, 29,046 of oats, and 16,520 of barley. The receipts of apples in 1871 were 328,763 bbls.; in 1872, 91,334; in 1873, 84,880. The receipts of lumber in 1871 were 103,000,000 ft., of which 65,200,000 came by rail, 33,500,000 by lake, and 4,300,000 from Canada; in 1872 the receipts were 76,947,000 ft., of which 4,900,000 came from Canada. About 60,000 cattle were sold in the Detroit market during the year, valued at \$2,422,000; hogs sold, 160,000, value \$1,760,000; sheep sold, 120,000, value \$435,000; total value of live stock sold, \$4,617,000. The city contained 642 stores in 1871, and there were 27 incorporated companies, chiefly manufacturing, having an aggregate capital of \$3,391,500. The manufactures are important, and have been rapidly extended within a few years. The vicinity to the Lake Superior iron region has given especial prominence to the working of iron, which employs 31 establishments, having an aggregate capital of \$4,000,000, and an annual product of \$10,000,000. These include 3 blast furnaces, 2 steam forges, a car wheel foundry, a manufactory of iron bridges, 11 machine shops, 5 boiler shops, 2 stove foundries, a manufactory of plumbers' and gas fittings, and a safe factory; to which may be added the railroad repair shops, the two blast furnaces and extensive rolling mills at Wyandotte, belonging to Detroit capitalists, and unenumerated establishments in the city. Besides the very extensive Pullman car works, there are two railroad car factories, producing \$4,500,000 worth of cars annually; 12 saw mills, which in 1873 manufactured 44,138,000 ft. of lumber; 3 ship yards; numerous manufactories of woodwork, including several of chairs and furniture, 1 of organs, 2 of wooden ware, 1 of matches, several of boxes, of sash, doors, and blinds, &c., producing annually goods valued at about \$4,000,000. In and near the city are 22 brick yards, manufacturing about 54,000,000 bricks annually. There are 7 large flour mills, which in 1873 produced 212,000 bbls. of flour; about 60 breweries,

malt houses, and distilleries, yielding 90,000 bbls. of beer annually; 16 tobacco factories, having an annual product of about \$4,500,000; a large number of cigar factories, 17 tanneries, 4 steam cracker bakeries, 4 large manufactories of boots and shoes, 1 of white lead, 2 of chemicals, 1 of hats, caps, and fur goods, and several of confectionery. The Detroit copper-smelting works annually produce over \$2,000,000 worth of ingot copper from Lake Superior ore. There are 3 national banks, with an aggregate capital of \$1,900,000; 3 state banks, capital \$350,000; and 4 savings banks, with \$390,000 capital, of which all but one do a general banking business also. The aggregate deposits, Oct. 1, 1872, were \$9,416,000. The Detroit fire and marine insurance company has a capital of \$150,000, the Michigan mutual life insurance company of \$100,000, and the Michigan health insurance and relief society of \$10,000.—The government is administered by a mayor and a board of aldermen of 22 members (two from each ward) elected by the people for a term of two years. There are a court held by the recorder, a police court, and a superior court of civil jurisdiction; and the circuit and probate courts for Wayne county, and the United States circuit and district courts for the eastern district of Michigan, are held here. Detroit has a police force consisting of about 100 men, under the control of a board of four commissioners appointed by the governor of the state. The fire department, managed by four commissioners, has seven steam fire engines, two hook and ladder companies, and a fire alarm telegraph. The water works, valued at \$1,221,752, are under the charge of five commissioners. The water is pumped from the river by three steam engines, having an aggregate capacity of 32,000,000 gallons daily, into the mains and a reservoir 1½ m. back, holding 10,000,000 gallons, and is distributed to every quarter of the city through 160 m. of pipe. The average daily consumption is 9,000,000 gallons. The city is furnished with gas by two companies, and has 1,137 street lamps. There are 40½ m. of paved street and 79¾ m. of sewers. Many of the streets are paved with wood. The assessed value of property in 1872 was \$23,615,674; cash value, \$78,718,913; taxation for all purposes, \$785,248. The house of correction, with capacity for 450 prisoners, is used for the confinement of petty criminals. Directly opposite is a home for discharged female prisoners. The United States marine hospital, on the bank of the river, just above the city, commands a fine view of the Canada shore. The other principal charitable institutions are the Harper hospital, adapted for 500 patients, St. Mary's hospital (Catholic), St. Luke's hospital and church home (Episcopal), the German orphan asylum, the women's hospital and foundlings' home, the Protestant orphan asylum, St. Anthony's boys' orphan asylum (Catholic), St. Vincent de Paul's orphan asylum (Catholic), the free dispensary, the

home for the friendless, the retreat for the insane, and the Hebrew widows' and orphans' society. In the ladies' industrial school vagrant children are taught the elements of learning and industry. The public schools are under the control of a board of 22 inspectors (two from each ward), elected by the people for two years, who appoint the superintendent of schools. A school census is taken between Sept. 1 and Oct. 10 of each year. In 1871 there were 28,779 children between the ages of 5 and 20 years, of whom 13,699 did not attend school during the year, and 12,092 between 8 and 14 years of age. The schools are divided into five grades: the high school and senior grades, in each of which the course is three years, and the junior, secondary, and primary grades, in each of which the course is two years. The statistics for the year ending Dec. 31, 1871, are as follows: number of schools, 131, viz.: 1 high, 18 senior, 30 junior, 37 secondary, 43 primary, and 2 mixed; number of teachers, 170, of whom 8 were males; pupils enrolled, 11,866; average daily attendance, 7,749; value of school property, \$505,810. The receipts for the year ending April 1, 1872, were \$162,615 from the city appropriation for schools and school houses, \$13,054 from the primary school fund, and \$2,629 from other sources; total, \$178,298. The expenditures for the same period were \$192,024, of which \$76,413 were for teachers' wages, and \$61,703 for building and furnishing school houses. At the close of 1871 there were 22 school buildings, with accommodations for 8,517 pupils, and two nearly completed, which would raise the number of sittings to about 9,500. There are a German-American seminary, a German Lutheran school, and several Catholic schools. The Detroit medical college was organized in 1868, and the Detroit homœopathic college in 1871. The public library contains more than 20,000 volumes; that of the young men's society, about 12,000; the library of the mechanics' society, 4,000; and the bar library, 3,100. The newspapers and periodicals are: 8 daily (3 German), 3 tri-weekly, 14 weekly (3 German), 7 monthly, and 2 quarterly. Besides the opera house, there are the German Stadt theatre and 23 public halls. There are 64 churches, including 5 Baptist (1 French, 1 German, and 1 colored), 2 Christian, 2 Congregational, 7 Episcopal, 2 Jewish, 7 Lutheran (German), 10 Methodist (2 German and 2 colored), 1 New Jerusalem, 6 Presbyterian, 9 Roman Catholic (1 French and 2 German), and 1 Unitarian; also 1 Spiritualist and 2 Christadelphian societies. There are 12 mission Sunday schools (1 French and 1 German), having an average attendance of about 1,800, and 3 convents (1 German).—The site of Detroit was visited by the French as early as 1610; the first permanent settlement was made by a party under Antoine de la Mothe Cadillac in 1701, when Fort Pontchartrain was built. In 1763 it passed into the hands of the Eng-

lish, and immediately afterward was besieged for 11 months by Pontiac in his attempt to expel the whites from that region. In 1778 it contained about 60 log houses, 300 inhabitants, and one Roman Catholic church. The same year the British erected a fort, at first called Fort Le Noul, but after the war of 1812 known as Fort Shelby, which remained till 1827. By the treaty of peace in 1783 Detroit was ceded to the United States, but the Americans did not take possession of it till 1796. It was destroyed by fire in 1805, one house only escaping. In 1807 the present city was laid out. During the war of 1812 it fell into the hands of the British by the surrender of Gen. Hull, but came again into the possession of the Americans in 1813, after the battle of Lake Erie. It was incorporated as a village in 1815, the government being vested in five trustees, and in 1824 a city charter was granted. Destructive fires occurred in 1836, 1840, 1848, and 1865. Upon the organization of the territory of Michigan in 1805, Detroit became the seat of government, and was the capital of the state from its admission into the Union (1837) till 1847.

DETROIT RIVER, a strait connecting Lakes St. Clair and Erie, and separating Canada from Michigan, about 22 m. long, and varying in breadth from 3 m. to less than $\frac{1}{2}$ m. Its course from Lake St. Clair to just below Detroit is S. W., from which point it flows nearly due S. The total descent is about 2 ft. The river rises and falls with the level of the lakes it connects; the average annual variation is only about $1\frac{1}{2}$ ft., and the extreme variation, from February, 1819, when it was the lowest, to July, 1838, when it was the highest ever known, was only about 8 ft. The principal island is Grosse Isle, near Lake Erie; there are several smaller ones, which are used as fishing stations, from which large quantities of white fish are caught. Rivière aux Canards, near Malden on the Canadian side, and the river Rouge near Detroit, small streams, are the principal affluents. As it has great depth of water and a strong and uniform current, the navigation of the Detroit is not affected by obstructions. The Canadian shore rises abruptly from the water to a height of from 20 to 25 ft., while the American shore is low, and in some places marshy.

DEUCALION, king of Phthia, in Thessaly, son of Prometheus and Clymene. According to tradition, being forewarned by his father of an approaching deluge, he built a ship in which he and his wife Pyrrha were saved from an inundation which destroyed all the rest of mankind. When the waters subsided, their vessel rested upon Mount Parnassus, and their first care was to consult the oracle of Themis as to how the world should be re-peopled. Being advised to throw behind their backs the bones of their mother, and interpreting mother to mean the earth, they cast stones behind them, from which sprang men and women.

DEUEL, an E. county of Dakota, bordering on Minnesota; area, about 650 sq. m.; pop. in 1870, 37. Its surface is broken by the Coteau des Prairies, and it is watered by several lakes and by affluents of the Big Sioux and Minnesota rivers.

DEUTERONOMY (Gr. *Δευτερονόμιον*, the repetition of the law, from *δευτερος*, second, and *νόμος*, law), the 5th book of the Pentateuch, containing the history of what passed in the wilderness during about five weeks (from the beginning of the 11th month to the 7th day of the 12th month), in the 40th year after the departure of the Israelites from Egypt. It recites to the people the events which had taken place in their history, and explains again the law which had been received at Sinai. According to the old traditional view, this book, like the four preceding books of the Pentateuch, was written by Moses, with the exception of ch. xxxiv. (the last), which gives an account of the death of Moses, and is supposed to have been written by the author of the book of Joshua, to serve as a point of transition to the latter book. Among the recent defenders of the authorship of Moses are Hengstenberg, Hävernick, Delitzsch, Keil, and Moses Stuart. According to Ewald and Riehm, the book was written under Manasseh; according to Bunsen, under Hezekiah; according to De Wette and Lengerke, under Josiah. Ewald is of opinion that it was written by a Jew living in Egypt; according to Gesenius and Bohlen, it was the work of the prophet Jeremiah.

DEUTZ (Lat. *Tuttium*), an old town and fortress of Prussia, in the province of the Rhine, on the right bank of the Rhine, opposite Cologne, with which it is connected by an iron bridge; pop. in 1871, 11,881. Among its finest buildings are the ancient church of St. Heribert, the new Protestant church, and the cavalry barracks. It has manufactories of velvet, ribbons, glass and china ware, chemicals and machines, and an iron foundry. It has a good harbor, and a new impulse has been given to the trade of the town by the Cologne and Minden railway, which begins here. The fortifications were razed after the peace of Nimègue in 1678, but were rebuilt in 1816, and have recently been enlarged. The town dates its origin from a castle built here in the 4th century by Constantine the Great.

DEUX PONTS. See ZWEIFBRÜCKEN.

DEV. See DEMONOLOGY.

DEVENTER, a fortified city of Holland, in the province of Overijssel, on the right bank of the Yssel, 8 m. N. of Zutphen; pop. in 1868, 18,218. It has narrow streets, spacious market places, handsome public promenades, a large town house, a court house, a prison, a weigh-house, several churches, a synagogue, and various literary, educational, and benevolent institutions. It has an excellent harbor, a prosperous trade, and extensive manufactories of Turkey carpets, stockings, iron ware, &c. It exports annually about 600,000 lbs. of butter,

and 350,000 Deventer cakes, for which it is celebrated. It was one of the Hanse towns, and in the 16th century ranked next after Amsterdam among the cities of the northern Netherlands.

DE VERE, Maximilian Schele, an American author, born near Wexiö, in Sweden, Nov. 1, 1820. He entered the military and afterward the diplomatic service of Prussia, but emigrated to the United States, and in 1844 was appointed professor of modern languages in the university of Virginia. Besides frequent contributions to periodicals, he has published "Outlines of Comparative Philology" (1853), "Stray Leaves from the Book of Nature" (1856), "Studies of our English" (1867), "First French Reader" (1867), "Grammar of the French Language" (1867), "The Great Empress," a novel (1869), "Wonders of the Deep" (1869), "Introduction to the Study of French" (1870), "Americanisms" (1871), and "The English of the New World" (1873). He has translated into English Spielhagen's "Problematic Characters" (1869), "Through Night to Light" (1869), and "The Hohensteins" (1870).

DEVEREUX. See ESSEX, EARL OF.

DEVIL, The (Gr. *διδάβολος*, the calumniator), in Christian theology, the sovereign spirit of evil. In the very earliest ages there appears to have been no distinct conception of any single spirit who was the embodiment of the evil principle. None of the divinities of the ancient Hindoos were supposed to exert a wholly bad influence. Their power was sometimes manifested for good, and sometimes for evil. In the post-Vedic period, though Siva the destroyer was one of the three great powers of nature, the exertion of his power was not necessarily evil. Kali, Siva's wife, and the Rakshasas, who were hostile to everything good, were gods whose nature partook of evil; but no single divinity represented in himself the evil principle. There was, however, such a divinity in the religion of ancient Persia. He was called Ahriman, and his power was represented as nearly equal to that of Ormuzd, the god of good, who reigned in heaven. Ahriman created devs and archdevs to resist the spirits that ministered to Ormuzd. The principles of this religion extended in some measure to the neighboring nation of the Chaldeans. The religion of the Semitic races was in its origin monotheistic. In it good and evil were alike caused by the supreme ruler. The religion of the Hebrews originally formed no exception. Even the Satan of the books of Job and Zechariah (the latter at least of late authorship) is a dependent spirit, in the service of God. But during or after the captivity the Jews borrowed from the Chaldeans or from the Persians the notion of a spirit who was the antagonist of all that is good and the personification of evil. In the gospels, written by Jews, the devil is represented as tempting Jesus to worship him. In the Christian theology, and the literature inspired by it, the devil

was conceived as a spirit who had once been good and had fallen. During the middle ages he was represented as having a black complexion, flaming eyes, sulphurous odor, horns, tail, hooked nails, and cloven hoofs. Such names as Devil's Dam, Devil's Bridge, &c., attest the belief in his actual interposition in human affairs.—The devil, as the ideal of evil, vice, craft, cunning, and knavery, has played a prominent part in literature. The following are examples: Fabricius, *Der heilige, kluge und gelehrte Teufel* (Esslingen, 1567); Musäus, *Der melancholische Teufel* (Tham, 1572); Velez de Guevara, *El diablo coxuelo* (Barcelona, 1646); Damerval, *Le livre de la diablerie* (Paris, 1508); *Le diable bossu, Le diable femme, Le diable pendu et dépendu, Le diable d'argent, Le diable babillard* (all early in the 18th century); *Le diable confondu* (the Hague, 1740); *Le diable hermite* (Amsterdam, 1741); Le Sage, *Le diable boiteux* (Paris, 1755); Frédéric Soulié, *Mémoires du diable* (Paris, 1842); "The Parlyament of Deuylls," printed by Wynkin de Worde (1509); "The Devill of Mascon" (Oxford, 1658); Defoe, "The Political History of the Devil, as well Ancient as Modern" (London, 1726); and Beard's "Autobiography of the Devil" (London, 1872). (See DEMONOLOGY.)

DEVIL FISH, a cartilaginous fish of the ray family, and the genus *cephaloptera* (Duméril). In this genus the head is truncated in front, and provided on each side with a pointed, wing-like process, separate from the pectoral fins, and capable of independent motion; these processes, however, seem sometimes to be prolongations of the pectorals, and give the name to the genus, which signifies wings upon the head. The pectorals are of great breadth, triangular, resembling wings, and making the transverse diameter of the fish greater than the longitudinal, with the tail included; the jaws are at the end of the head, the lower the more advanced; the eyes are prominent and lateral; the tail is armed with one or two serrated spines, and is long and slender; in front of the spine is a small dorsal fin with 36 rays; the teeth are small, numerous, flat, and arranged in many rows; the small nostrils are placed near the angles of the mouth, and openings (probably the auditory) are situated on the dorsal aspect of the appendages to the head, behind the eyes; the branchial openings are five on each side, large, linear, near each other, the fifth being the smallest; the ventral fins are small, rounded, near the base of the tail; the skin is rough to the touch, like that of some sharks; the skeleton is cartilaginous. The old genus *cephaloptera* has been divided by Müller and Henle, and the genus *ceratoptera* added. In the first the mouth is on the ventral aspect, and the pectorals are prolonged forward to a point beyond the head, resembling horns; four species are described. In the second the mouth is at the end of the snout, the upper jaw is crescentic, and the under convex; there

are no teeth in the upper jaw, and they are small and scale-like on the under; the pectorals are separated from the precephalic fins by a rayless space; this includes three species, and among them, probably, the one mentioned below as caught at Kingston, Jamaica. The devil fish mentioned by Catesby, in his "Natural History of Carolina," is probably the same as the gigantic ray described by Mitchill in vol. i. of the "Annals of the Lyceum of Natural History of New York," under the name of the "vampire of the ocean" (*C. vampyrus*, Mitch.). This specimen was taken in the Atlantic, near the entrance of Delaware bay, in 1823, and was so heavy as to require three pair of oxen, a horse, and several men to drag it on shore; it weighed about five tons, and was 17½ ft. long and 18 ft. wide; the skin on the back was blackish brown, and on the belly black and white, and very slimy; the mouth was 2¾ ft. wide, the greatest breadth of the skull 5 ft., and the distance between the eyes 4½ ft.; the cranial appendages were 2½ ft. long and a foot wide, tapering, supported internally

Devil Fish (*Cephaloptera vampyrus*).

by 27 parallel cartilaginous articulated rays, allowing free motion in almost all directions, and probably used as prehensile organs; the immense pectorals were attached to the scapular arch, and contained 77 articulated parallel cartilaginous rays, and were used like wings to fly through the water. The specific name of this ray was given by Mitchill from its size, representing in its family what the vampire does in the bat family. This specimen was again described by Lesueur in the "Journal of the Academy of Natural Sciences" (vol. iv., 1824), as *C. giorna* (Lacép.). Cuvier and De Kay consider the latter a distinct species, rarely exceeding the weight of 50 lbs. The devil fish is occasionally seen on the coast of the southern states in summer and autumn, and wonderful stories are told of its strength and ferocity, its extraordinary shape and size having transformed a powerful but inoffensive animal into a terrible monster. Other species are met with in the tropical parts of the Atlantic and Pacific, both in mid ocean and on sandy coasts, which they approach to bring forth their young. They are not uncommon in the West Indies, and Dr. Bancroft, in vol. iv. of the "Zoölogi-

cal Journal," describes one which was captured in 1828 in the harbor of Kingston, Jamaica, after a resistance of several hours, which dragged three or four boats fastened together at the rate of four miles an hour. In this specimen, which was smaller than the one described by Mitchill, the mouth was 27 in. wide, opening into a cavity $4\frac{1}{2}$ ft. wide and 3 ft. deep, and so vaulted that it could easily contain a man. He named it *C. manta*, which is doubtless a synonyme of *C. vampyrus* (Mitch.). Anson and other writers have described a fish like a quilt, which wraps itself around a diver and squeezes him to death. The ray called devil fish undoubtedly gave rise to these stories, but it is anatomically impossible that it can so seize its prey, and it does not appear that any one has ever witnessed such an event. The pectoral fins of the devil fish are too thick at their base and anterior margin, and their cartilages are too rigid, to allow of their being so bent downward as to enfold a man or any other prey in the manner alluded to; they are composed of a great number of joints, more than 600, and must be capable of a considerable variety of motions calculated to impel the animal through the water with great strength and speed. The appendages to the head can hardly be used in locomotion. Lieut. St. John, who has watched attentively the movements of this fish, says these flaps are used in driving a large quantity of water toward the mouth when the animal is at rest, feeding; they can be bent in front of and even into the mouth; and are probably prehensile organs for various purposes; when swimming, the flexible ends are coiled up. The nature of the teeth and the narrowness of the gullet also render it improbable that this fish feeds upon anything but small fry, which it sweeps toward the mouth with its cranial flaps. The truth appears to be that the devil fish, though powerful and hideous, is a timid and harmless creature, avoiding rather than attacking man; but when attacked and defending itself, the serrated spine of the tail would prove a dangerous weapon, inflicting a deep, lacerated, and possibly fatal wound to man or fish within its range. They are gregarious, and are pursued by fishermen for the oil of the liver.—The *pieuvre* of Victor Hugo's *Travailleurs de la mer*, rendered "devil fish" in the English translation of that work, is a fictitious monster, the description of which applies to no species of the devil fish.—Another large and hideous fish, which is sometimes called sea devil or devil fish, is the *lophius piscatorius* (Linn.); this is described under Goose Fish. (See also OOROPTS.)

DEVILLE. I. Charles Sainte-Claire, a French geologist, born on the island of St. Thomas in 1814. He studied at the school of mines in Paris, and wrote *Voyage géologique aux Antilles et aux îles de l'Énérigie et de Fogo*, published in parts (Paris, 1856-'64). The great eruption of Vesuvius in 1855, which he wit-

nessed, called forth an interesting correspondence with Elie de Beaumont. He has long filled the chair formerly held by Beaumont at the collège de France. Among his latest publications is *Sur les variations périodiques de la température* (1866). II. Henri Étienne Sainte-Claire, a chemist, brother of the preceding, born on the island of St. Thomas, March 11, 1818. He studied in France, and devoted himself to chemical researches. After occupying for several years a chair of chemistry in the normal school, he succeeded Dumas in 1859 at the faculty of sciences in Paris. He discovered in 1849 the properties and preparation of anhydrous nitric acid, and published in 1852 an important paper on the metallic carbonates and their combinations. In 1853 he discovered a new method of mineral analysis, by means of gases and volatile reagents. About the same time he began his experiments with aluminum, and discovered a cheap method of producing it. He published his researches on the subject in his *De l'aluminium, ses propriétés, sa fabrication et ses applications* (Paris, 1859). He has since prepared several papers on a simplified general method for the production of simple metals, and on the variation of chemical affinities at different temperatures. (See DISSOCIATION.) He published in 1862 *Rapport à l'empereur sur la fusion de l'acier au four à réverbère sans emploi du creuset*, and in the following year *Métallurgie du platine et des métaux qui l'accompagnent* (3 vols. 8vo, with 3 charts).

DEVIL'S ADVOCATE. See ADVOCATUS DIABOLI.

DEVIL'S BRIDGE, a remarkable stone bridge in the canton of Uri, Switzerland, near Ander-

Devil's Bridge.

mat, by which the road from Switzerland to Italy by the pass of St. Gothard crosses the Reuss. The original bridge was built by Abbot Gerold of Einsiedeln in 1118, and was partly destroyed by the French, Aug. 14, 1799. It was afterward restored, but is no longer in actual use. It spans the river at a height of about 80 ft., without a parapet. The bridge now in use, completed in 1830, is about 20 ft. higher than the old one, or 100 ft. above the river, with high parapets; its arch has a span of 25 ft. Near the bridge is a tunnel 180 ft. long, through which the road passes, called the Urnerloch, or hole of Uri.

DEVIL'S WALL, a name given during the middle ages to the remains of some Roman fortifications designed to protect the settlements on the Rhine and the Danube against the inroads of the German tribes. These defences originally consisted of a row of palisades, in front of which extended a deep ditch. The emperor Probus strengthened them by the erection of a wall about 300 m. long, passing over rivers and mountains, and through valleys, and protected by towers placed at intervals. Portions of this wall are still distinguishable between Abensberg in Bavaria and Cologne on the Rhine. In some places the ruins are overgrown with oaks, in others they form elevated roads or pathways through dense forests.

DEVISE, the disposition of lands to take effect after the death of the devisor. It is a term of Norman origin, and signified at first any division of lands, *marque de division ou partage de terres*, from the Latin *divido*. The instrument by which lands are devised is called a will. The disposition of personal estate to take effect after the death of the person making it is in legal language a testament; but the common appellation, where both real and personal estate are included, is last will and testament. The Roman *testamentum* applied equally to the disposition of real or personal estate, and the same rules were observed in either case. But the mode of executing a will has been always more formal in England than was required for the validity of a testament. (See **WILL**.)

DEVIZES, a parliamentary borough and market town of Wiltshire, England, on the Great Western railway and on the Kennet canal, 82 m. S. W. of London; pop. in 1871, 6,840. It contains two handsome parish churches, besides other places of worship, and a fine town hall. Its manufactures are chiefly silk, crape, snuff, and malt. The grain market held here every Thursday has been famous ever since the time of Henry VIII., and is still the largest in the west of England. The town is supposed to owe its origin to a strong castle built here in the reign of Henry I. by Roger, bishop of Salisbury, and dismantled toward the close of the reign of Edward III.

DEVONIAN, the name of one of the geologic ages, the age of fishes, and the second of the

three ancient or palæozoic divisions of time. It followed the Silurian, or age of mollusks, which till recently was thought to contain the earliest vestiges of organic life, and preceded the carboniferous. These three ages, constituting the palæozoic era, were followed by the age of reptiles, which constitutes the mesozoic era. The Devonian age, or Devonian formation, as the rocks are called, was named from Devonshire in England by Sir R. Murchison and Prof. Sedgwick, who about the year 1837 distinguished its strata from those of the Silurian below and the carboniferous above. The transition of the Silurian to the Devonian formation is gradual and easy, and sometimes rather difficult to determine; so much so that differences of opinion exist in regard to some of the strata in certain localities; but a broad distinction in the two ages is marked by the forms of the development of life. The periods and epochs into which the Devonian age is divided, according to the system of the New York state geologists, are as follows:

DEVONIAN AGE.

- | | |
|---------------------------|----------------------------|
| 5. Catskill period..... | Catskill red sandstone. |
| 4. Chemung period..... | 2. Chemung epoch. |
| | 1. Portage epoch. |
| | 3. Genesee epoch. |
| 3. Hamilton period..... | 2. Hamilton epoch. |
| | 1. Marcellus epoch. |
| | 3. Upper Helderberg epoch. |
| 2. Corniferous period.... | 2. Schoharie epoch. |
| | 1. Cauda galli epoch. |
| 1. Oriskany period..... | Oriskany red sandstone. |

The first and second periods are often called the lower Devonian, and those above, the upper Devonian. The corniferous was the great limestone period of America. Above it shales and sandstones predominate, the limestone beds being subordinate. The Oriskany formation, named from Oriskany, Oneida co., N. Y., is about 30 ft. thick at that place, composed mainly of rough sandstones. Along the Alleghanies it extends through Pennsylvania, Maryland, and Virginia, and in these states often reaches a thickness of several hundred feet. No land plants have been found among its fossils, and the mass of evidence points to the non-existence of land vegetation during the Oriskany period. The most common species of animals are the *spirifer arenosus* and *Rensselaeria ovoides*, their large fossil shells being often crowded together, and composing a good share of the rock. The *cauda galli* epoch of the corniferous period is named from the feathery forms of a fossil, supposed to be the impressions of a seaweed. The rock is principally argillaceous sandstone, and in the Helderberg mountains, near Albany, N. Y., is from 50 to 60 ft. thick. The rocks of the Schoharie epoch are principally fine-grained, calcareous sandstones, full of fossils. In New York the beds are all in the eastern part of the state. The rocks of the upper Helderberg epoch are limestones, and are widely distributed over the interior continental basin from New York to beyond the Mississippi. In New York they

are divided into Onondaga and corniferous limestone. This latter, from which the period takes its name, is called corniferous because it contains masses of hornstone or imperfect flint. The plants of this period are seaweeds and protophytes, the *cauda galli* being among the former. The upper Helderberg epoch is the coral reef period of the paleozoic ages, abounding in corals, some of which are found standing in the position in which they grew, but they are generally more or less comminuted. This formation attains in some places a thickness of 350 ft. The corniferous period is especially remarkable for containing the earliest discovered remains of fishes, the first development of vertebrate animals. The oldest development of them has been found in the United States, in the Schoharie grit. The Devonian formation contains two of the great divisions of fishes, the salachians or sharks, and the ganoids, of which the gar-pike and sturgeon are representatives. The Marcellus shale of the Hamilton period is a soft argillaceous rock, containing sufficient traces of coal to afford a flame when placed in a fire. The Hamilton beds contain shale and flagging stone, and are overlaid by the black Genesee shale. The Hamilton beds are remarkable for containing numerous ripple marks, and for having the strata intersected by regular joints; fine examples of which are found near Cayuga lake, N. Y. These beds contain fine fossils of gasteropods, cephalopods, and trilobites. The Hamilton formation extends across New York from Lake Erie east, having its greatest thickness, about 1,200 ft., east of the centre. It extends into Michigan, Illinois, and Iowa, in thinner strata. The rocks of the Portage epoch of the Chemung period have a thickness of 1,000 ft. on the Genesee river, and of 1,400 ft. near Lake Erie, but are not found in eastern New York. The Chemung group extends over the southern tier of counties in New York, attaining in places a thickness of 1,500 ft. It abounds in organic remains, both vegetable and animal, containing, besides the *cauda galli* seaweed, numerous land plants, and many species of crinoids, brachiopods, conchifers, bellerophons, and goniatites. The last period of the Devonian formation, the Catskill, is composed mainly of shales and sandstones, the latter predominating, passing into conglomerates particularly in the upper formations. There are ripple marks and other signs of wave action. The vestiges of animal life are fewer than in the earlier periods, and widely differ from them in character. No corals, crinoids, brachiopods, or trilobites have been found. There are a few conchifers and fragments of fishes, some of which were of large size, the fins being a foot in length. The beds, however, have not been fully explored. The land plants are of much the same character with those of the Chemung period. A frond of one of the characteristic ferns, found at Montrose, Pa., was more than a foot in breadth. The Catskill formation is thin in the

western part of New York, but along the Hudson river, in the Catskill mountains, it attains a thickness of 2,000 or 3,000 ft. It passes beneath the coal formation in Pennsylvania and Virginia, attaining in the Appalachian region a thickness of 5,000 or 6,000 ft.—The Devonian rocks appear at the surface in most parts of all the continents; in Great Britain they appear in Wales, Herefordshire, Devonshire, and Cornwall, and are also found in Ireland and the Isle of Man; but they are most developed in the United States.

DEVONPORT, a parliamentary and municipal borough and naval arsenal in Devonshire, England, on the South of Devon railway, and on the Tamar, where that river makes a bold sweep toward the east and widens into the fine estuary called the Hamoaze, just before its entrance into Plymouth sound, 190 m. S. W. of London, and $1\frac{1}{2}$ m. W. of Plymouth; pop. of parliamentary borough in 1871, 64,684. Its

Guildhall, Public Library, and Column to commemorate the Renaming of the Town.

harbor, one of several remarkable natural havens opening into the sound, is 4 m. long, $\frac{1}{2}$ m. wide, from 15 to 20 fathoms deep, perfectly safe, and capable of sheltering the whole British navy at once; but it is difficult of entrance. The town is bounded S. and W. by the river, and E. by a creek which separates it from Stonehouse, contiguous to Plymouth. With these two places it is so closely connected that the three may almost be said to form a single city, and it was not till 1824 that Devonport acquired separate municipal privileges, and changed its old name of Plymouth Dock for its present one. Among its schools are a naval and military free school, and an institution in which 100 girls are educated and clothed. The town has a public library, orphan asylums, and a theatre. Water is brought from Dartmoor, in a winding con-

duit nearly 30 m. long. With the exception of some breweries and soap-boiling houses, Devonport contains no factories of importance. The density of the population is greater than that of any other place in England, viz., 130,000 to the square mile. Devonport is fortified on three sides by a wall, a breastwork, and a ditch 12 to 20 ft. deep cut in the solid rock; while the entrance from the sea is commanded by several heavy batteries. These works were begun by George II. The chief feature of the town is the dock yard, which employs 2,500 men. It was commenced by William III., who built the basin and two docks. It has a river front of 3,500 ft., and a maximum breadth of 1,600 ft., the area enclosed being about 96 acres. There are two dry docks, one double and one single dock for ships of the line, one graving dock, five building slips, and vast docks or basins at Point Keyham for fitting and repairing war steamers, commenced in 1844, and embracing an area of 72 acres. The immense roofs over the docks, consisting of single arches, without buttresses or pillars, are wonders of architectural skill. A canal 70 ft. wide runs nearly through the yard, communicating with the boat pond.

DEVONSHIRE, a maritime county of England, bounded N. and N. W. by the Bristol channel, W. by the river Tamar and Marston Water, which separate it from Cornwall, S. and S. E. by the English channel, and E. and N. E. by Dorsetshire and Somersetshire; area, 2,589 sq. m.; pop. in 1871, 600,814. The principal rivers of Devon are the Taw, Torridge, Tamar, Dart, Teign, Exe, and Tavy. Trout are found in great plenty in most of these; the Tamar, Tavy, and Exe furnish valuable salmon fisheries, those of the last being thought the best in England. The county has three canals: the Great Western, 35 m. long, connecting the S. E. coast with the Bristol channel, the Tamar canal, and the Tavistock canal. The Bristol and Exeter and the South of Devon railways also traverse it. Devonshire is a rich mineral country, furnishing copper and lead in considerable abundance, with smaller quantities of tin, iron, bismuth, and many other minerals, besides coal and marble. The tin mines were anciently numerous and valuable, but are now nearly abandoned, those of Cornwall being so much richer. There are several varieties of lead ore, one of which is very rich in silver. Cobalt, antimony, and native silver have been found in considerable quantities. The marbles quarried from the limestone rocks on the E. and S. coasts much resemble Italian marble in texture and appearance. Fine pipe clay, potters' clay, and slate of excellent quality are abundant. The agriculture of Devonshire is in a flourishing condition, about three fourths of the land being under cultivation. The S. and S. E. parts contain extensive wastes, including Dartmoor, covered with immense rocks and detached masses of granite. In the N. and N. W. are found large tracts of swampy

ground and many peat bogs of great depth. The vale of Exeter, containing about 200 sq. m., is one of the richest valleys in the kingdom. The district called South Hams, extending from Torbay round to Plymouth, is known as the garden of Devonshire, and is finely diversified and very productive. The pasture lands are chiefly devoted to dairy uses, though some attention is paid to raising sheep and cattle. Devonshire is celebrated for its cider and its cattle. The purest breeds are distinguished by a high red color, without white spots; they are fine in the bone and clean in the neck, thin-skinned, and silky in handling; have horns of medium length bent upward, a small tail set on very high, a light dun ring around the eye, and are noted for feeding at an early age. The cows weigh from 420 to 460 lbs., the oxen from 700 to 820 lbs. The North Devon cattle, another variety, are in great demand for the firm grain of their meat, and the superior qualities of the oxen for work. The native horses are small, but hardy, and much accustomed to the packsaddle. Landed property in Devonshire is more evenly divided than in most other counties, there being few very large freeholds. Farms average from 100 to 200 acres. The spinning of linen yarn, and manufacture of linen goods, have superseded the former woollen manufacture. In and about Tiverton great quantities of lace and lace net are made, which find a market on the continent of Europe. Ship building gives employment to numbers of men. The chief ship yard is the royal dock yard at Devonport. The county town is Exeter, where the assizes are held. Among the other principal towns are Plymouth, Dartmouth, Tavistock, Okehampton, Totness, Honiton, Axminster, Tiverton, and Barnstaple. The county gives the title of duke to the Cavendish, and of earl to the Courtenay family. There are ruins, British and Roman, in various parts of the county, among which are several abbeys and castles.

DEVRIENT, the name of a family of German actors, of whom the most eminent are: **I. Ludwig**, born in Berlin, Dec. 15, 1784, died Dec. 30, 1832. His father, a silk mercer, intended him for a mercantile life, but at the age of 18 he joined a company of actors, and made his debut at Gera in Schiller's "Bride of Messina." He afterward travelled with the same company through Saxony, and in 1805 accepted an engagement at the court theatre of Dessau, and attained brilliant success. Pecuniary embarrassments drove him some years later from this place. He went to Breslau, and subsequently, at the suggestion of the actor Iffland, to Berlin, where in 1815 he appeared as Franz Moor in Schiller's "Robbers." From that time until his death he stood at the head of his profession in Germany. He was equally great in comedy and tragedy. **II. Karl August**, nephew of the preceding, born in Berlin, Aug. 5, 1798. He served in a regiment of hussars in the campaign of 1815 against

France, and was present at the battle of Waterloo; was afterward engaged in mercantile pursuits, and in 1819 made his début on the stage at Brunswick. In 1823 he married the celebrated singer Wilhelmine Schröder, from whom he was divorced in 1828. (See SCHRÖDER.) He acted in all parts of Germany, but was for many years established at Hanover. He was long celebrated for his spirited personation of leading parts in genteel comedy. **III. Philipp Eduard**, brother of the preceding, born in Berlin, Aug. 11, 1801, died Oct. 4, 1877. He first appeared as a baritone singer, but afterward acted almost exclusively in the spoken drama. He was a careful and cultivated actor, a successful writer of dramas, and an authority on all that pertains to the profession. His chief works have been collected under the title of *Dramatische und dramaturgische Schriften* (8 vols., Leipsic, 1846-'61), including several plays, miscellaneous publications relating to the stage, and a history of the drama in Germany. **IV. Gustav Emil**, brother of the preceding, born in Berlin, Sept. 4, 1803, died in Dresden, Aug. 7, 1872. Like his two brothers and his uncle, he was intended for the mercantile profession, but in 1821 went upon the stage, where he soon gained distinction, assuming with success many of the parts, both in tragedy and comedy, with which his uncle Ludwig's name is identified. His wife, Dorothea Böhrer, from whom he was divorced in 1842, was an excellent comic actress, and ably seconded her husband for many years. On Nov. 10, 1857, the 98th anniversary of Schiller's birthday, three members of the Devrient family, Gustav Emil, Karl August, and Karl's son, appeared together at Hanover, in the play of "Don Carlos." Gustav retired from the stage in 1867, having accumulated a large fortune; after which he wrote a history of the German stage, and an autobiography which was to be published after his death.

DEW, the humidity of the air, deposited on cool surfaces with which it comes in contact. It is commonly formed at night upon the leaves of grass and trees and other objects, especially when the sky is clear so as to permit sufficient radiation of heat from them to cool their surfaces, and consequently the layer of air next them, below the point of saturation, or dew point. The moisture which collects upon the surface of a cold body, as a pitcher of ice water, standing in a warm room, and that which collects on a window pane when it is breathed upon, are strictly examples of the deposition of dew, and also the frosted figures which form on windows and stone flaggings of courtyards and walks. In the latter case the solid surfaces have a temperature below the freezing point of water, and therefore the particles of moisture assume a crystalline form during the act of passing from their invisible vapory condition. The figures thus formed owe their variety to the varying degrees of temperature and moisture, and rapidity of deposition, and also to the nature of the surface of

the body and its thermal inequalities, which necessarily exist in curves. The different causes of the formation of dew were never clearly understood until the early part of the present century. The ancients connected its appearance with the intervention of supernatural powers. As it mysteriously appeared when the air was clear and apparently dry, and gathered upon the herbage in sparkling beads, while it avoided the barren and rocky surfaces, they might well look upon it as a special blessing, possessed of wonderful virtues. Hence it came to be prescribed for restoring the charms of youth, and to be used by the alchemists as a solvent of subtle and mysterious powers. The ancients generally entertained the idea that the moon and stars not only poured down cold upon the earth, but also, in some mysterious way, distilled dew. Aristotle was the first to approach a rational explanation, although, from a want of knowledge only obtained by the use of modern philosophical instruments, his explanations contained errors. He believed aqueous vapor to be a mixture of water and heat; and as it rarely appeared on mountain heights, he supposed it was abandoned by the heat, and left to precipitate itself upon the earth. He rejected the idea of lunar or astral influence, and maintained that the sun was the prime cause, "since his heat raises the vapor from which the dew is formed as soon as that heat is no longer present to sustain the vapor." In the middle ages philosophers revived the notion that the moon and stars were the cause of dew. Battista Porta showed the erroneousness of these views by instancing several facts, but he discarded the correct part of Aristotle's theory, that dew was condensed vapor separated from the atmosphere, and advanced the idea that it was condensed air itself. Musschenbroek observed that it was deposited more readily on some substances than on others, and therefore correctly inferred that the object itself had an important influence in its formation. This led to a reconsideration of Aristotle's theory, and its adoption, with the modification that instead of its being discharged from the mass of the air it was only removed from the stratum in contact with the object upon which it was deposited. The experiment of placing a cold body in a warm moist atmosphere proved the correctness of this theory. But it was not till a series of experiments were made by Dr. William Charles Wells (a London physician, though a native of Charleston, S. C.), and published in August, 1814, that a comprehensive theory of the formation of dew was publicly promulgated. His experiments were made in a garden in Surrey, near Blackfriars bridge, and will for ever remain as admirable examples of ingenious philosophical investigation. He exposed little pieces of dry wool of equal weights and sizes during the night, their increased weight in the morning showing the amount of dew which had been deposited. The quantity thus collected

was found to be greater on clear than on cloudy nights, but there was much difference in the amount deposited on different clear nights. He discovered that the quantity was less, not only when the air was drier, but also when the wool was covered by any kind of a screen, whether this was a board, a piece of cloth, a tree, or a cloud. Supporting a board a few inches above the ground and placing one piece of wool under and another upon it, each weighing 10 grains, he found that the upper piece gained 14 grains, while the under one gained only 4. He discovered, moreover, that when he used thermometers, the greatest deposition of dew always accompanied the lowest temperature; thus, he often found the temperature 9° or 10° lower above the board than under it, and on one occasion the thermometer fell 14° lower when freely exposed upon the grass than when suspended four feet above it. A piece of cotton in the vicinity of the latter place gained only 11 grains, while a piece of equal weight and size gained 20 grains lying upon the grass. The passing of clouds would cause the thermometer to rise and fall as they screened the locality or left it exposed to the clear sky. In consequence of the different capacities which bodies have of radiating heat, they attain different temperatures, and upon those which radiate and therefore cool the most rapidly, the greatest quantity of dew is deposited. Dr. Wells found that grass and wood were covered with it, while plates of metal, stones, and gravel walks were free from it. A glass thermometer placed upon a metal plate and exposed to the clear sky was, after a time, moist with dew, while the plate was dry. To ascertain whether this was caused by difference in position or external circumstances, he placed another thermometer having a gilt bulb beside the glass one, when the latter showed a temperature 9° lower than the other. This was because glass is a better radiator than metal, and therefore cools more rapidly.—The following synopsis of the attendant phenomena of dew is compiled from all the recorded observations.

1. The dew falls most abundantly during calm nights.
2. The drops deposited by fogs resemble dew, but differ in that fog wets all bodies indifferently, while dew attaches itself to some in preference to others.
3. Fogs may exist during winds; dew generally disappears if the wind rises.
4. Dew is deposited in preference on surfaces not protected by shelter from exposure to the clear sky.
5. Other things being equal, the quantity of dew deposited in a given time diminishes in proportion as the exposure to the sky is cut off by screens, whether they be above or on one side of the bedewed body.
6. The nature of a body, and especially the smoothness or roughness of its surface, affects the quantity of dew deposited on it. Thus, leaves of plants receive more than the earth, sand more than compact soil, glass more than metals; and in general substances that are poor conductors of heat, and

yet cool rapidly by radiation, such as glass, cotton, flax, hair, down, &c., are most heavily bedewed.

7. Dew is deposited during the entire night, beginning by or before sunset, and continuing until after sunrise; it forms most rapidly about sunrise.
8. A slight movement of the air is very favorable to the production of dew; but moderate or strong winds are not so, though they do not cause it to disappear entirely.
9. Fogs, haze, clouds, smoke, &c., act as do solid screens to diminish the deposition of dew; very low clouds accompanied by strong winds altogether prevent the dew.
10. The most abundant dews are observed on the shores of the oceans, lakes, rivers, &c.; the least abundant in the interior of dry continental plains, and on islands and ships in mid ocean. Ships approaching a coast soon begin to receive a deposit of dew. The clear cool nights of the western coasts of America and Palestine are peculiarly favorable to the formation of dew.
11. The accurate measurements of Wells show that as much as 20 grains of dew may be deposited in a single night on a surface two inches in diameter. Dr. Dalton estimates the entire amount of annual precipitation in England to equal five inches of rain.
12. The dew is heaviest in the first clear still night after long continued rain, and in general increases with the dampness of the air.
13. A very great difference of temperature between the air next to the ground and that a few feet above accompanies the formation of dew, especially when heavy.
14. The electrical condition of a body has no influence on its capacity for receiving dew.
15. Objects a few inches above the surface of the soil collect more dew than those lying on the ground itself. From all the preceding observations, Wells arrived at an understanding of the origin and the laws regulating the formation of dew; his conclusions are now, with slight modifications, very generally accepted. According to this view, the radiation of heat from the earth's surface into space, which is counterbalanced during the day by the reception of heat from the sun, takes place with most freedom through a clear, dry air, and is counteracted by screens, clouds, and fogs. The surface of a body exposed to unobstructed radiation into space loses its heat entirely, except in so far as this is supplied by conduction from the interior of its mass, or by convection through the action of sufficiently rapid currents of air. Thus it happens that the air in contact with the exposed surface of a bad conductor, but a good radiator, is cooled to the temperature of its dew point, and begins to deposit its moisture on the cold surface. If the air be absolutely motionless, only a slight deposit will be formed, and that very slowly; but by reason of the increasing density of the increasingly colder air the latter sinks, and is replaced by warmer air having the same humidity. Thus a continual supply of moist air is maintained, and this is favored by a very slight general movement of the air; while, on

the other hand, a strong wind conveys too much heat to allow of the cooling of the bedewed body. The hygrometric tables of Glaiher, Regnault, and others, allow of an accurate prediction as to the quantity of dew that may be deposited, and even enable one to determine whether frost or dew will prevail. It will thus be seen that the true origin and nature of dew was quite misunderstood until early in the 19th century.—The **DEW POINT** is the temperature at which the vapor contained in the atmosphere condenses into water. It depends upon the amount contained within a given space; the greater this is, the higher will be the degree of heat necessary to retain it in a vaporous condition. When the air is saturated with vapor it is of course at its dew point, and any reduction of its temperature will cause the separation of a portion of moisture. As this process continues the dew point becomes gradually lowered, and although the proportion of moisture held in solution by the air diminishes, the degree of humidity remains the same; for this term is used not to denote the actual proportion of vapor, but the power of sensibly manifesting itself upon any given reduction of temperature. It is often called relative humidity, and is expressed in parts of 100, or the amount which would saturate the air at the particular temperature when the observation is taken. Thus, at Philadelphia the average humidity of the air is 73, meaning 73 per cent. of the quantity necessary for saturation; at St. Helena it is 88; at Madrid, 62; in parts of India it is sometimes as low as 10; and on the Andes it is often still lower. Air which is heated much above its dew point is regarded as dry, although it may contain a greater proportion of vapor than that which is called humid. In California the dew point is sometimes 78° below the temperature of the air, and among the Andes the difference is often greater. It has been found as much as 45° at Philadelphia, but the usual range is from 10° to 25°. The following table shows the mean relative humidity of the atmosphere in New York from several observations made each day at the Cooper institute, for the Smithsonian institution, by Prof. Morris:

Date, 1873.	Relative Humidity.	Temperature, Fahrenheit.	Date, 1873.	Relative Humidity.	Temperature, Fahrenheit.
Jan. 1	67-68	26°	June 1	53-13	76°
" 2	83-43	27-06	" 2	36-66	72-66
" 3	93-3	41-83	" 3	48-90	61-33
" 4	60-8	38-23	" 4	80-93	60-9
" 5	87-36	30	" 5	54	77-38
" 6	46-50	33-6	" 6	51-20	73-83
" 7	52-6	25	" 7	48-26	68-16
" 8	83-13	30-16	" 8	61-43	68-13
" 9	54-73	31-06	" 9	47-90	70-5
" 10	28-46	22-96	" 10	59-03	76-33
" 11	54-43	11-73	" 11	59-16	70-66
" 12	43-7	21	" 12	46-6	69-33
" 13	75	36	" 13	49-1	66-33

The difference between the dew point and the temperature of the air is called the complement of the dew point. From numerous observa-

tions which have been made with Daniell's and Bache's hygrometers, and with the wet-bulb thermometer, a method has been deduced for determining the dew point with sufficient accuracy, by observations made with the latter instrument. The ratio of the complement varies with the temperature of the air: thus, when it is 53° the difference between the dry and wet bulb is one half the complement; at 32° it is one third, and at 26° only one sixth. Tables have been constructed for readily determining the dew point, which may be found in the various works on meteorology. Thus, in the above table it is stated that the relative humidity of the air at New York, June 1, 1873, was 53-13, while the temperature was 76° F. By referring to the table of relative humidity in the article **HYGROMETRY**, it will be seen that the complement of the dew point was about 18°; that is, the dew point was about 18° lower than the temperature of the air, or about 58°. (See **EVAPORATION**, **HEAT**, and **HYGROMETRY**.)

DEW, Thomas Roderick, an American publicist, born in Virginia, Dec. 5, 1802, died in Paris, Aug. 6, 1846. He graduated at William and Mary college, and afterward travelled for two years in Europe. In 1827 he was chosen professor of moral science in William and Mary college, of which he became president in 1836. In 1829 he published "Lectures on the Restrictive System," and in 1833 an elaborate essay on "Slavery," which is said to have prevented emancipation in Virginia at that time. He died suddenly while on a visit to Europe with his bride. His most elaborate work is "A Digest of the Laws, Customs, Manners, and Institutions of Modern Nations," which appeared in 1853.

DEWBERRY. See **BRAMBLE**.

DEWEES, William Potts, an American physician, born at Pottsgrove, Pa., May 5, 1768, died in Philadelphia, May 18, 1841. He attended several courses of lectures at the university of Pennsylvania, and, without having taken any degree, in 1789 commenced the practice of medicine at Abington, Pa. The degree of M. D. was subsequently conferred on him by the university. The yellow fever having in the summer and autumn of 1793 thinned the ranks of the physicians in Philadelphia, in December of that year Dr. Dewees removed thither, selecting obstetrics for his specialty, and achieved a high reputation in that department. In 1812, being threatened with a pulmonary affection, he relinquished practice, and for five years devoted himself to agriculture. In 1817 he returned to Philadelphia. In 1826 he was elected adjunct professor, and in 1834 professor of obstetrics and diseases of women and children in the university of Pennsylvania. In the latter year he was attacked by paralysis, and at the commencement of the following year he was obliged to resign his professorship. He settled in Mobile, but resumed his residence in Philadelphia about a year

before his death. He published "Inaugural Essays," "Medical Essays," "System of Midwifery," "A Treatise on the Physical and Medical Treatment of Children," and "A Treatise on Diseases of Females." His last systematic work was his "Practice of Medicine," published in 1830.

D'EWES, Sir Symonds, an English antiquary, born in Coxden, Dorsetshire, Dec. 18, 1602, died April 18, 1650. He graduated at Cambridge, and was admitted to the bar, but never practised, and lived on his property at Stow Hall in Suffolk. He was high sheriff of Suffolk in 1639, was elected to parliament for Sudbury in 1640, and was one of the Puritan members expelled from the house of commons by "Pride's purge." He commenced collecting materials for a history of England at the age of 18, and though the fruits of his research were not published by him, they were of great use to Selden and other writers. After his death his "Journals of all the Parliaments during the Reign of Queen Elizabeth" (folio, London, 1682) was published by his nephew. His "Autobiography and Correspondence," edited by J. O. Halliwell (4 vols. 8vo, London, 1845), contains some interesting pictures of his times and contemporaries, intermixed with much that is useless and with a comical display of vanity.

DE WETTE, Wilhelm Martin Leberecht, a German theologian, born at Ulla, near Weimar, Jan. 14, 1780, died in Basel, June 16, 1849. Having studied at Weimar and Jena, he was appointed professor of philosophy, and subsequently of theology, at Heidelberg, and received in 1810 a professorship at the university of Berlin, where he rapidly acquired great reputation both as a teacher and as a writer. This situation he lost in 1819, in consequence of a letter of consolation written to the mother of Sand, the murderer of Kotzebue, which was regarded by the government as extenuating that political murder. He was afterward elected professor of theology in the university of Basel. His works are among the most remarkable productions of German theological science and criticism. The most important of them are: *Beiträge zur Einleitung in das Alte Testament* (2 vols., 1806-'7); *Commentar über die Psalmen* (1811); *Lehrbuch der hebräisch-jüdischen Archäologie* (1814); *Ueber Religion und Theologie* (1815); *Lehrbuch der christlichen Dogmatik* (2 vols., 1813-'16); "Critical and Historical Introduction to the Old and New Testaments" (2 vols., 1817-'26; the Introduction to the Old Testament was translated and enlarged by Theodore Parker, Boston, 1843, and that to the New by Frederick Frothingham, Boston, 1858); *Christliche Sittenlehre* (3 vols., 1819-'21); "Theodore, or the Skeptic's Conversion" (1822; translated by James F. Clarke, Boston, 1841); "Lectures on Practical Ethics" (1823; translated by Samuel Osgood, Boston, 1842); *Opuscula Theologica* (1830); *Das Wesen des christlichen Glau-*

bens (1846); a new translation of the Bible, executed together with Augusti, in 6 vols. (1809-'14); and an edition of Luther's works.

DEWEY, Chester, D. D., an American clergyman, born at Sheffield, Mass., Oct. 25, 1784, died in Rochester, N. Y., Dec. 15, 1867. He graduated at Williams college in 1806, was licensed to preach in 1808, and during the latter half of that year officiated in Tyringham, Mass. The same year he accepted a tutorship in Williams college, and in 1810 was appointed to the chair of mathematics and natural philosophy, and occupied it 17 years. From 1827 to 1836 he was principal of the gymnasium at Pittsfield, Mass., and was also professor of chemistry in the medical colleges there and at Woodstock, Vt. In 1836 he became principal of the collegiate institute at Rochester, N. Y., and in 1850, on the establishment of the university of Rochester, he was elected professor of chemistry and natural history, from which position he retired in 1860. He was active in efforts for the advancement of public schools, and was for a time president of the teachers' institute. He made the study of grasses a specialty, and discovered and described several new species. In the class of *carices* he was a recognized authority, and his writings on this subject make an elaborate monograph, patiently prosecuted for more than 40 years. He was an extensive contributor to the "American Journal of Science and Arts," and wrote numerous papers on botany, and a "History of the Herbaceous Plants of Massachusetts," which was published by the state. His latest publications were two review articles, "The true Place of Man in Zoölogy," and "An Examination of some Reasonings against the Unity of Mankind." For nearly 50 years of his active life Prof. Dewey delivered an average of 70 sermons a year, though he was never a pastor.

DEWEY, Orville, D. D., an American clergyman, born at Sheffield, Mass., March 28, 1794. He graduated at Williams college in 1814, studied divinity at Andover from 1816 to 1819, was for eight months agent for the American education society, and declined an immediate and permanent settlement on account of unfixed opinions in theology, but accepted a temporary call at Gloucester, Cape Ann, with a candid explanation of his unsettled views, and here became a Unitarian. He was soon after appointed assistant of Dr. Channing, preached two years in his pulpit, and formed with him an intimacy that lasted during Channing's life. In 1823 he accepted the pastorate of the Unitarian church in New Bedford, where he remained ten years, until, broken in health, he sought restoration in a voyage to Europe, June, 1833. "The Old World and the New" (2 vols., 1836) contains the history of his two years' absence. In 1835 he was called to the second Unitarian church in New York, which during his ministry built the "church of the Messiah," and became a very large and prosperous society. In

1842, his health again failing, he went abroad for two years, returned in 1844, and was compelled by continued ill health to dissolve his connection with his church in 1848, and retire to his farm in Sheffield, where he prepared a course of lectures for the Lowell institute at Boston, on the "Problem of Human Life and Destiny," which was repeated twice in New York, and delivered in many other places. This course was followed in 1855 by another Lowell course on the "Education of the Human Race," which was almost as widely repeated. Meanwhile he filled a Unitarian pulpit in Albany one winter, and in Washington two. In 1858 he was settled as pastor over the Unitarian society in Church Green, Boston, known as the "New South," from which after four years' service he returned to his home in Sheffield. The first book he published was a little work, which attracted much attention, entitled "Letters on Revivals." During his ministry at New Bedford he contributed to the "Christian Examiner" and the "North American Review." On leaving New Bedford he published a volume of sermons. His subsequent works have been collected and published in three volumes (New York, 1847); they consist of "Discourses on Human Nature," "Discourses on Human Life," "Discourses on the Nature of Religion," "Discourses on Commerce and Business," "Miscellaneous and Occasional Discourses," "The Unitarian Belief," and "Discourses and Reviews."

DEWITT. I. A S. county of Texas, drained by the Guadalupe river; area, 898 sq. m.; pop. in 1870, 6,443, of whom 1,757 were colored. It abounds in fine scenery, and has a hilly or rolling surface. The soil, particularly in the valley of the Guadalupe, is fertile. There are several medicinal springs, mostly sulphurous. The chief productions in 1870 were 107,896 bushels of Indian corn, 13,583 of sweet potatoes, 55,523 lbs. of butter, 21,275 of wool, and 541 bales of cotton. There were 5,520 horses, 5,547 milch cows, 53,832 other cattle, 17,232 sheep, and 7,226 swine. Capital, Clinton. **II.** A central county of Illinois, intersected by Salt creek; area, 675 sq. m.; pop. in 1870, 14,768. It is mostly level, and comprises forests of valuable timber and fertile prairies, remarkably easy of cultivation. Bituminous coal is the chief mineral product. The N. division of the Illinois Central railroad crosses it, and the Indianapolis, Bloomington, and Western railroad intersects the S. E. corner. The chief productions in 1870 were 118,185 bushels of wheat, 1,311,635 of Indian corn, 216,756 of oats, 88,120 of potatoes, 20,289 tons of hay, 341,456 lbs. of butter, and 96,916 of wool. There were 7,873 horses, 4,351 milch cows, 7,706 other cattle, 21,799 sheep, and 29,322 swine; 12 carriage factories, 1 flour mill, and 2 manufactories of saddlery and harness. Capital, Clinton.

DE WITT, Jan, a Dutch statesman, born in Dort in 1625, murdered at the Hague, Aug.

20, 1672. From his father, who had been a member of the states and a conspicuous opponent of the house of Orange, he inherited strong republican tendencies. The imprisonment of his father in 1650 intensified his hatred of the stadtholders; and the death of William II. in October of that year gave a favorable turn to the fortunes of De Witt. In 1652 he was one of the deputation sent to Zealand to dissuade that province from adopting the Orange policy, and the eloquence he then displayed gave him considerable popularity. In the following year he became grand pensionary of Holland; and his new power was at once exerted to the utmost to put an end to the plurality of offices which had rendered the stadtholders almost despotic. He so far succeeded that the office of stadtholder was abolished; and in negotiating the treaty of Westminster with Cromwell (1654), he procured the insertion of a secret article by which the house of Orange was to be for ever excluded from the highest offices. When Charles II. was restored, De Witt sought to form an alliance with France; and England thereupon declared war against Holland. After hostilities had continued two years, the advantage was with Holland; De Ruyter's fleet was in the Thames and had burned the British shipping in the Medway, and the peace of Breda was concluded, July, 1667. Though De Witt managed the affairs of his office with great skill and wisdom during this war, his popularity sensibly declined, and the Orange party continually gained strength. When France assumed a hostile attitude toward Holland, he made such haste to form an alliance with Sweden and England that he had the treaty ratified at once by the states general, when it should have been referred to the council of each province. However this action may have been justified by the emergency, it was easy to make it a cause of popular clamor and distrust. Yet the grand pensionary did not abate his hostility to the house of Orange, or cease his efforts for regulating the finances and otherwise strengthening the internal condition of the government. Louis XIV. having succeeded in detaching England from the Dutch interest and forming a counter alliance, and his armies having invaded Holland in 1672, De Witt lost all hold on the confidence of the people, and was obliged to resign his office. William III. of Orange was made commander-in-chief of the Dutch forces, and was nominated stadtholder. De Witt's brother Cornelius, two years older than himself, had served with distinction in the navy for several years during his youth, was afterward appointed inspector of war vessels, and was again conspicuous under De Ruyter when the fleet entered the Thames. He was more celebrated, however, as a magistrate, and had risen to the office of deputy in the states general. The popular clamor excited against his brother was turned upon him also, and he was accused of plotting against the life of the prince

of Orange, and thrown into prison and tortured. On his release, Jan was waiting for him at the gate, when both were seized by a mob and murdered. The states general demanded an investigation of the affair; but the stadtholder neglected to do anything about it, and was therefore believed to have countenanced the assassination. The brothers, by their ability, courage, and integrity, had commanded the respect and admiration even of their political opponents. Jan was the author of several works of political interest.

DEWSBURY, a manufacturing town and parish of England, in the West Riding of Yorkshire, situated on the left bank of the Calder, and on the London and Northwestern railway, 28 m. S. W. of York; pop. in 1871, 24,773 (in 1851, 5,031). It is at the head of what is called the shoddy trade of England, vast quantities of refuse woollen rags, called "devil's dust," being collected from all parts of the kingdom and made into cloth, blankets, and carpets. About 3,000 persons are employed in these manufactures. There are collieries and iron works in the immediate neighborhood.

DEXTER, Samuel, an American statesman and jurist, born in Boston, May 14, 1761, died at Athens, N. Y., May 4, 1816. He graduated at Harvard college in 1781, and was admitted to the bar in 1784. After practising at various places in Massachusetts, he took up his residence in Boston. He was elected to the legislature of Massachusetts several times, and became a member of congress in 1793. In 1798 he was elected senator of the United States. He was appointed secretary of war by John Adams in 1800, and in 1801 secretary of the treasury, but returned to practice in 1802. He was a member of the federal party, but did not sympathize with it in regard to the war of 1812. In 1814 he was nominated by the republican party for the office of governor, on account of his opposition to the Hartford convention, but was defeated. He was the first president of the first temperance society in Massachusetts.

DEXTRINE (Lat. *dexter*, right; called also British gum, Alsace gum, starch gum, and torrefied starch), an isomeric condition of starch, having the composition $C_6H_{10}O_5$ or $C_{12}H_{20}O_{10}$. It is also isomeric with gum arabic, which it much resembles in appearance and in many properties, but differs in the remarkable one, from which it derives its name, of turning the plane of polarization to the right when polarized light is passed through a solution of it, instead of to the left, which is the case when a solution of gum arabic is used. Starch will also turn the plane of polarization to the right, but in a much less marked degree than dextrine; the latter having an optical rotary power of 138.68° . Dextrine is an intermediate stage between starch and grape sugar, passing into the latter by combining with H_2O , but differing from starch in physical qualities only. Another intermediate modification between

starch and dextrine exists, according to Maschke and others, called soluble starch, which possesses a higher degree of right-hand polarizing power than dextrine and is turned blue by iodine. (See STARCH.) Dextrine may be produced by several processes. 1. By carefully roasting starch in shallow pans or revolving cylinders, heated between 300° and 310° F. When the starch presents a light brown color, and emits the odor of strongly baked bread, the transformation is effected. 2. By subjecting starch to the action of nitric acid. Payen's method was to mix 1,000 parts of dry starch with 2 parts of nitric acid of 36° Baumé, diluted with 300 parts of water, and place the mixture in layers about an inch thick on brass drawers in an oven heated to about 240° F. The transformation is effected in an hour and a half or two hours. 3. By boiling starch with dilute sulphuric acid, about 11 parts of water, 4 of starch, and 1 of sulphuric acid being used. The starch is stirred in part of the water, and the acid diluted with the remainder. Both portions are then raised to about 194° F. and gradually mingled; the temperature being maintained until as great a quantity as possible of dextrine is obtained, when the liquid is boiled to arrest the production of grape sugar, which is always formed in the process. The dextrine can only be obtained pure by repeatedly dissolving it in water and precipitating with alcohol. 4. By the action of diastase on starch. If 8 or 10 parts of malt are stirred in about 400 parts of water at 80° F., and the mixture is raised to about 140° , and then 100 parts of starch are stirred in, the temperature being again raised to 158° – 167° , and there maintained for about half an hour, the starch will be converted into dextrine; but unless the temperature is changed the latter will pass into grape sugar. By raising the mixture to the boiling point, however, the transformation is arrested.—Dextrine, when pure, is solid, translucent, and uncrystallizable. It is ordinarily a brownish-colored powder, nearly tasteless, soluble in hot or cold water and in dilute alcohol, but insoluble in absolute alcohol. It is not colored blue, but red, by the action of iodine. When boiled with dilute acids and caustic alkalis, it is converted into glucose or grape sugar. If a small quantity of caustic potash is mixed with a solution of dextrine, and a dilute solution of sulphate of copper added drop by drop, the liquid will acquire a deep blue color, and will not yield a deposit while cold; but if heated to 185° F., it will be decomposed, with precipitation of oxide of copper. This test (Trommer's) distinguishes it from gum arabic. It has been found that the presence of dextrine prevents the blueing of starch by iodine, and will even discolor iodide of starch. Dextrine is used for stiffening cotton goods to prepare them for printing, and for sizing paper. It is a superior substitute for gum arabic, to give an adhesive layer to postage stamps and the

edges of envelopes; also to labels, particularly those for glass bottles, causing them to adhere more permanently than any other suitable substance. Confectioners employ it in the manufacture of lozenges. It is often employed with great advantage in the preparation of bandages to keep broken bones in perfect relative position. For this purpose it is generally used as crudely prepared by the action of sulphuric acid. Potato starch is generally used in the manufacture of dextrine, on account of its cheapness and greater purity.

DEY, throughout the 17th century the title of the commander of the armies of Algiers, subject to a pasha appointed by the Porte. At the beginning of the 18th century the dignity of pasha was united with that of dey, and the dey was the highest officer of Algiers from that time till the conquest of the country by the French in 1830. The deys were appointed and deposed by a council or divan, and the deposition of a dey was generally followed by his death. His nomination was announced to the Porte at Constantinople, which always confirmed it by a firman. The dey, who was also the commander-in-chief of the army and navy, exercised with his ministers all the executive authority; and the later deys took away the power of the divan.

DEYRA DOON, or *Dehra Doon*, a valley of British India, between the S. W. base of the lowest and outermost ridge of the Himalaya and the N. E. slope of the Sivalik mountains, the former having an elevation of 7,000 or 8,000 ft., and the latter of about 3,000; between lat. 30° and 30° 32' N., and lon. 77° 43' and 78° 24' E. It is bounded S. E. by the Ganges and N. by the Jumna, is drained by their tributaries, and with the hilly region called Jounsar Bawur forms a district under the lieutenant-governorship of the Northwest Provinces. The productions are rice, maize, grain, cotton, sugar, opium, indigo, plantain, and hemp. Every English plant is said to thrive luxuriantly, and considerable success has attended the cultivation of tea. The valley is watered by numerous streams, and abounds in game. The climate during part of the year is very unhealthy. The district was formerly included in the dominions of the rajah of Gurhwal, was overrun by the Gorkhas in 1803, and in 1815, during the Nepal war, was invaded by the British, who suffered great loss here, and who, after the expulsion of the Gorkhas, kept possession of the territory.—**DEYRA**, the principal town of the district, is situated in dense mango groves, at the intersection of two routes of trade, 2,369 ft. above the sea, and 125 m. N. N. E. of Delhi.

DIABETES, *Glucosuria*, *Diabetes Mellitus*, or *Glucœhemia* (Gr. *διαβαίνειν*, to pass through), a disease characterized by an excessive secretion of

saccharine urine. Though disease marked by diuresis and attended with wasting of the body was frequently spoken of by earlier authors, Willis (1659) was the first who noted the distinctive character of the complaint, the presence of sugar in that fluid. Since his time diabetes, which is not very rare, has been frequently made a subject of study, yet still much obscurity envelops its causes, its essential character, and its treatment. The invasion of diabetes is commonly insidious. The attention of the patient is perhaps first attracted by the quantity of urine he passes and by the frequent calls to void it, or he notices that while his appetite is greatly increased he is growing weaker and thinner. The urine is not only greatly increased in quantity, but somewhat changed in appearance; it is paler, transparent when first passed, and assumes on standing an opalescent tint like the whey of milk or a solution of honey in water. It has no odor, or a somewhat aromatic one, compared by some to that of new-made hay, by Dr. Watson to that of a room in which apples have been kept. If kept for a few days at a moderately elevated temperature, instead of acquiring an ammoniacal odor, like ordinary urine, it has a sharp, vinous smell, and will be found to be acid rather than alkaline. The urine has commonly a decidedly sweet taste; drops of it upon the patient's linen or clothes stiffen them like starch, and sometimes leave on evaporation a powdery efflorescence. The specific gravity of the urine is greatly augmented; instead of being on the average about 1.024, as is commonly the case, it ranges from 1.025 to 1.050; M. Bouchardat reports it even as high as 1.074. Two or three simple tests are sufficient to render the presence of sugar certain. In Trommer's test, a drop or two of solution of sulphate of copper is added to a little of the urine in a test tube; a solution of caustic potash is now added in excess, and the mixture gently boiled over a spirit lamp for a few minutes; if sugar is present, a precipitate of a reddish or yellowish brown color (suboxide of copper) will be thrown down, otherwise the precipitate will be black (common oxide). In Moore's test, a little of the urine is mixed in a test tube with about half its volume of liquor potassæ, and the mixture boiled five minutes; if sugar be present, the fluid will acquire a brown hue, otherwise it remains unchanged. A third test is founded on the fact that diabetic urine rapidly undergoes fermentation when mixed with a little yeast and kept in a warm place. The sugar to which diabetic urine owes its peculiar properties exists in the form of glucose or grape sugar. This is present in all proportions, from a mere trace to 30, 50, and even 134 parts in 1,000. The quantity of solid matter thus drained from the system is very great; Watson estimates it on the average at 1½ lb. a day, but it sometimes amounts to many times this quantity; and it is this drain of solid matter, together with the large amount of urine passed, which gives rise

to the constant thirst and enormous appetite. Early in the disease the symptoms are not well marked; when the complaint is established, and the large excretion of urine begins to attract attention, the patient complains that despite his excessive appetite he grows thinner and weaker; the mouth is pasty, the skin dry and hard, the bowels constipated. The digestive functions, at first normal, become deranged; the patient is troubled with heartburn, with a feeling of weight and pain in the epigastrium, and sometimes with vomiting. The strength declines, he becomes emaciated, the generative functions are impaired or lost; vision often becomes dim, the gums are spongy, there is tenderness and swelling about the orifice of the urethra, the memory and intellect fail, and the temper becomes irritable. In the course of the disease pulmonary consumption is very apt to supervene and carry off the patient. Toward the last diarrhoea, fetid breath, effusion into the great cavities, and oedema of the extremities precede death. Diabetes is essentially a chronic disease, lasting often many years; it is also obstinate and intractable, although most of the cases seem benefited by treatment, and sometimes it appears to be completely cured.—In the beginning of the present century Dr. Rollo found that the amount of urine in diabetic patients as well as its sweetness was very much diminished by confining them to an animal diet. When the ready conversion of starch into grape sugar became known, this was assumed to be the origin of the sugar, and the benefit derived from an exclusively animal diet was thus explained. But few patients have the resolution to restrict themselves for any length of time to such a diet, and even when persevered in it is found to be merely palliative. C. Bernard has ascertained that sugar is a normal production of the liver in all classes of animals, carnivorous as well as herbivorous; that it takes place in the liver of the foetus as well as in that of the adult; that irritating the origin of the pneumogastric nerves in the fourth ventricle increases the secretion of sugar, producing an artificial diabetes. In a state of health the normal secretion of sugar poured into the circulation by the hepatic veins is rapidly decomposed and excreted by the lungs; when the amount is increased by disease, the excess passes off by the kidneys. Under the influence of diastase, sugar is likewise formed from the starch of the food in the process of digestion, as a necessary preliminary to its absorption. When diabetic patients are placed upon an animal diet, this source of supply is cut off, and the amount of sugar in the urine is diminished, but it is still present, since the liver keeps up a supply. M. Mialhe, believing that sugar in the course of the circulation is decomposed under the influence of the alkalinity of the blood, and that in diabetes the blood is deficient in alkalinity either positively or relatively to the amount of sugar contained in it, recommends the use of bicarbon-

ate of soda in large doses. He recommends half a drachm to be taken three times a day, morning, noon, and night; this is gradually increased until from 180 to 270 grains are taken in the course of the day. In addition, the patient is directed to take Vichy water with his meals, and is recommended to drink two or three pints of lime water daily. He is allowed the ordinary variety in his diet, but the quantity of farinaceous food is reduced one half, or at least one third. Flannel is ordered to be worn next the skin; the vapor bath is administered two or three times a week. By these means Mialhe reports a number of cases to have been cured. Dr. A. Clark (New York "Medical and Surgical Journal," January, 1859) reports several cases of diabetes either cured or greatly benefited by the use of bicarbonate of soda and of blisters to the nape of the neck. He administered the soda in doses of 11 grains, to be taken as frequently as could be borne until the urine was rendered alkaline or the stomach was nauseated. Besides the alkaline treatment, the means principally relied on have been, restricting the quantity of farinaceous matter in the patient's diet as far as possible, indulging him in watery vegetables (spinach, turnips, cabbage, &c.) rather than in bread or potatoes, and the use of opium. This last remedy allays the nervous irritability of the patient, and diminishes the thirst and the urinary secretion.—*Diabetes insipidus* is a disease characterized like the above by the daily discharge of an unnatural quantity of urine; but in this case it is of less specific gravity than natural, and contains no sugar. It consists in fact of the discharge of an excessive quantity of water by the kidneys, the natural ingredients of the urine being simply diluted by the increased volume of the fluid. The daily quantity of urine discharged in this disease may amount to several gallons, while its specific gravity is as low as 1.005. It is accompanied by a corresponding thirst, the patient drinking water enough to supply that discharged by the kidneys. Diabetes insipidus often lasts a long time without serious injury to the health.

DIAGORAS OF MELOS, surnamed the Atheist, a Greek philosopher, lived in the time of Socrates and Aristophanes, but neither the date of his birth nor that of his death is known. He must have removed from his native island to Athens before the performance of the "Clouds" of Aristophanes (423 B. C.), for he is alluded to in that piece as one well known to the Athenians. He was a disciple of Democritus of Abdera. He ridiculed the popular religion, and attacked especially the Eleusinian mysteries. He was accused of impiety (411), but the real grievance was his politics. Fearing the result of a trial, he made his escape from the city. He was condemned to death by the court, and a price set upon his head; yet he lived for a time at Pallene, and finally died at peace in Corinth. His works are all lost.

DIAL, an instrument for ascertaining the hour of the day by means of rays of light coming from the heavenly bodies. There are therefore solar, lunar, and astral dials. The sun dial only will be considered in this article. It is one of the oldest of human inventions, but its origin cannot be traced. The earliest historical mention of it is in the Old Testament, where we are told of the miracle wrought with the dial of Ahaz, king of Judah, at the instance of the prophet Isaiah, for a sign to Hezekiah, the son of Ahaz. The instrument used by the Chaldean historian and astronomer Berosus, early in the 3d century B. C., is the most ancient of whose form we have any precise account. It was a hollow hemisphere, with its convexity turned toward the earth, and a button or small globule held in the spherical centre, which, by casting a shadow in the concavity, marked the succeeding hours from one rim to the opposite. It gave place to dials which required more mathematical knowledge for their construction; but a hemisphere properly adjusted will answer the purpose of a dial very well, and was used by several nations long after the commencement of our era. Four have been discovered in modern times in Italy. One found at Tivoli in 1746 is supposed to have belonged to Cicero. Another was found in 1762 at Pompeii, and as it was adapted to the latitude of Memphis, it has been ascribed to the Egyptians, although no sun dial has ever been discovered among the ruins of Egypt, nor have any representations of it been found among their sculptures. It is believed, however, that they used some form of sun dial, notwithstanding the care they bestowed upon clepsydres, and their probable use of the pendulum. Perhaps the obelisks erected in honor of the sun were used as gnomons, and it has been suggested that the famous circle of Osymandyas might have been used to determine the azimuths of the heavenly bodies, and therefore the hours of the day. The tower of the winds at Athens, which from its architecture is judged to be of a somewhat later date than the time of Pericles, is an octagonal structure, and bears eight sun dials for the cardinal and intermediate points of the compass. They are described in Stuart's "Antiquities of Athens." Four others, known as the dials of Phædrus, also found at Athens, are now in the British museum, and are described in Delambre's *Histoire de l'astronomie ancienne*. Their construction shows that the Greeks used geometrical methods for vertical and also for declining dials. The first sun dial said to have been erected in Rome was by L. Papirius Cursor, who had taken it from the Samnites. About 30 years after another was placed near it by M. Valerius Messala, who brought it from Sicily in the second year of the first Punic war. It was made for the latitude of Catania, $4\frac{1}{2}^\circ$ south of Rome. The first dial constructed at Rome, and adapted to its latitude, is said to have been by the order of Q. Marcius Philip-

pius, in 164 B. C.—The sun dial may have many forms, depending upon its position in regard to the sun, and upon the latitude in which it is used. The most common form at the present day is the horizontal dial. It consists of a horizontal plate upon which the hours are marked, and which supports a style or gnomon for casting the sun's shadow, having its edge parallel with the axis of the earth. Another form is that called the equinoctial dial, consisting of a staff or gnomon placed parallel with the axis of the earth, and passing perpendicularly through the centre of a circle divided into equal parts for marking the hours. The slight deviation of the sun's apparent from the true time is not taken into account in the construction of dials, the correction being made after the observation is taken. Let fig. 1 rep-

FIG. 1.

resent the earth, N the north pole, A B the equator, and *a, b, c, d, e*, meridian lines; *a, c, e*, and *e* marking the quadrants. As the earth revolves on its axis with uniform motion once in 24 hours, each point moves through 15° every hour; therefore, if it is noon on the meridian *a*, in three hours after it will be noon on the meridian *b*, 45° from *a*, and in six hours the meridian *c*, marked 90° , will be brought vertically beneath the sun. All the rays of the sun which strike the earth are apparently parallel, because of his immense distance, which is about 12,000 times the earth's diameter. It will therefore be 6 o'clock in the morning on the meridian *e* when it is noon on the meridian *a*. Suppose a circle to be placed at the pole, in the plane of the horizon, and divided into degrees corresponding with those on the equator, and a staff which shall represent an extension of the earth's axis to pass through its centre; it follows that when the sun's path is

north of the equator the staff will cast a shadow upon the circle, which will traverse it with uniform motion, passing through its 360° in 24 hours. Such a circle and style would form an equinoctial dial, which, if placed on the meridian a at the equator, with its gnomon or style parallel with the earth's axis, would, while the sun's rays fall upon it, measure the time in the same way as at the pole; that is, the gnomon would traverse corresponding degrees at the same time. Instead of the shadow traversing the whole circumference of the dial, as it would at the pole, it can only traverse the lower half, between 6 in the morning and 6 in the evening. Place a similar dial D on the meridian a , between the equator and the north pole, also with its gnomon parallel to the earth's axis, and therefore inclined to the horizon with an angle equal to the latitude of the place, and the shadow of the gnomon will travel the face of the dial precisely as in the case of the circle C , with the difference that when the sun's path is north of the equator the shadow will be cast before 6 in the

F into equal segments. Draw EM , EN , and EC on the horizontal plane, meeting GM , GN , and GC in M , N , and C , and with a radius E F and a centre at E describe the arc F P , meeting EC in P ; also with the same radius and centre describe the arc F K , meeting the line EH in K . The angle FGC is at the centre of the equinoctial arc, and has FC for its tangent, and the angle FEH is at the centre of the hour arc and also has FC for its tangent. The corresponding equinoctial and hour arcs have therefore a common tangent. As GF is always perpendicular to EH , it follows that the radius of the equinoctial arc will always be the sine of the latitude arc FK . It will moreover be observed that the radii of the latitude and hour arcs will always be equal, and proportional to the radius of the equinoctial arc, as the hypotenuse of a right-angled triangle to one of its sides; and therefore that the common tangent FC will always measure a larger equinoctial than hour arc. All these relations being constant, we derive the following equations:

$$\begin{aligned}\text{rad. equinoct. arc} &= \sin. \text{ lat. arc.} \\ \text{tan. equinoct. arc} &= \tan. \text{ hour arc.}\end{aligned}$$

Multiplying equals by equal ratios, we have

$$\text{tan. hour arc} \times \text{rad. equinoct. arc} = \sin. \text{ lat. arc} \times \text{tan. equinoct. arc};$$

and

$$\text{tan. hour arc} = \frac{\sin. \text{ lat. arc} \times \text{tan. equinoct. arc.}}{\text{rad. equinoct. arc.}}$$

It will be observed that if the line EH were a rod, the circle IOF a material plane, and the angles at G each equal to 15° , the apparent motion of the sun would cause the rod's shadow to fall upon the lines GM , GN , and GC at the hours 1, 2, and 3 respectively, and also upon the lines EM , EN , and EC of the horizontal plane or hour arc. Let it be required to find the first hour angle on either side of the meridional line for a horizontal sun dial in the latitude of New York, which is $40^\circ 42' 43''$. By logarithms:

$\sin. \text{ lat. arc } 40^\circ 42' 43'' =$	9.814419
$\tan. \text{ equinoct. arc for 1 hour } = 15^\circ =$	9.428052
	<hr/>
$\text{rad. equinoct. arc} =$	19.242461
	10.000000
	<hr/>
$\tan. \text{ hour arc, } 9^\circ 54' 45'' =$	9.242461

The hour angles for 10 and 2 o'clock will be found by substituting 30° for 15° of the equinoctial circle, and for 9 and 3 o'clock by substituting 45° , and so on till 6 o'clock, when the angles will decrease in the same ratios in which they increased. A dial with its hour plane in a vertical position is called a vertical dial, and may be regarded as the complement of the horizontal, because the angle of inclination of the gnomon to the plane of the dial is the complement of that angle in the horizontal dial if taken to a latitude which is the complement of that for which it is intended as a vertical dial. Vertical dials have north and south

FIG. 2.

morning and after 6 in the evening, falling upon the northern face; and when the sun's path is south of the equator it will fall upon the south face, but not till after 6 in the morning nor until 6 in the evening. In the horizontal dial the shadow does not traverse the hour circle with a uniform motion (except at the poles), but travels faster the further it recedes from the vertical position; so that the lines which mark the hours require to be further apart near the morning and evening than near noon. The hour lines may be determined by the following elementary method of plane trigonometry. Let $ABCD$, fig. 2, be a horizontal plane upon which the hour lines of a dial are to be described. Draw the meridional line EF , and from E erect EH parallel to the earth's axis, to represent the gnomon. Then, with a centre G on EH as an axis, describe the equinoctial circle IOF , its plane being parallel with the plane of the equator. Draw the meridional line IF , and also GM , GN , and GC , dividing the arc O

faces, for the reason that the shadow of the sun can never fall upon the south face before 6 in the morning or after 6 in the evening; but when he rises before 6 in the morning his beams will fall upon the north face. This, being the counterpart of the south face, will show the hour. A horizontal dial and the south face of a vertical one are represented in fig. 3. The first of these cannot be used with much accuracy in less than 20° of latitude, because as we approach the equator the gnomon becomes more and more parallel with the horizon, so that if its length remains the same the upper end will cast but a very small shadow during the hours near midday. For instance, during the first hour before or after noon the sun in passing through 15° will cast a shadow on the horizontal plane but little more than one fourth the height of the gnomon. If this be 6 in., the edge of the shadow will be only $1\frac{1}{2}$ in. from the perpendicular. As the height of the upper end of the gnomon above the dial is to its length as the sine of an angle is to the radius, it follows that in lat. 30° the edge of the gnomon would require to be 12 in. in order to give it an elevation of 6 in. To retain this elevation in lat. 10° , the gnomon would have to be about $3\frac{1}{2}$ ft. long, and in lat. 5° about 7 ft.; which, for various reasons (one of which is that the oblique shadows would be too dim to be plainly discernible), makes its use impracticable. The nearer we approach the pole the more does the gnomon approach a perpendicular position, until at the pole it becomes an extension of the earth's axis; the hour angles, as marked upon the horizontal plane, becoming equal, as shown at E in fig. 1.

Fig. 3.

—A glass cylinder having a rod for an axis and its surface marked with 24 equidistant lines, parallel with the axis, was used by Ferguson in the construction of dials, and is itself a form

of equinoctial dial which may be used in any latitude by placing its axis parallel with the axis of the earth. It would thus be a modification of the dial of Berosus, if the hour lines

Fig. 4.

were marked upon the latter as meridians, the shadow of the axis falling upon the parallel lines of the cylinder precisely as they would upon the meridians of the hemispheres. Fig. 4 represents the hemisphere of Berosus suspended in a graduated arc, by means of which its gnomon may be adjusted to the latitude of the place. It may also be turned upon its axis and held at any degree of inclination to the east or west, so that when the days are more than 12 hours long it will indicate the time before 6 in the morning and after 6 in the evening. The lines 5, 6, 7, 8, &c., are intended to represent meridians, and should meet at the poles A B. A magnetic needle and a pair of spirit levels facilitate its adjustment. Burt's solar compass (see COMPASS, SOLAR) contains a sun dial which is an elaboration of this plan. An hour arc is held in a plane having an inclination corresponding to the latitude of the place. Over this arc an arm, attached to what is called the declination arc, is made to move until the sun's rays coincide with the axis of the arm, when the number of degrees traversed by the hour arc will indicate the sun's apparent time. This is the most correct sun dial that can be constructed.

DIALYSIS (Gr. *διάλυσις*, a separating), or **Analysis by Diffusion**, names given by Prof. Thomas Graham to a method proposed by him for effecting certain separations, usually of compound substances one from another, by means of the different rates at which substances diffuse through moist gelatine-like films or other septa, or upward through water or viscid

masses. (See ENDOSMOSE, and GAS, vol. vii., p. 634.) An example will illustrate the nature of the processes and results. A sheet of thin paper being thoroughly moistened, and depressed at the middle to form a sort of cup, a solution containing 5 per cent. each of cane sugar and gum arabic is poured into it; and the paper cup is then placed upon the surface of water in a deep basin narrow enough to keep its edges elevated, and left for 24 hours. The cup being removed at the end of the time, the quantity of liquid it contains is found increased by endosmose; but while a little of the liquid in the vessel below, tested with acetate of lead, shows a mere trace of gum, upon evaporation of the remainder the sugar crystallizes from it, in quantity equal to three fourths of that placed within the paper cup. The sugar, therefore, has rapidly made its way through the septum used, while the passage of the gum has been almost perfectly resisted. The paper can be replaced by moist animal membrane, or by a thin layer or film of any substance having the character of a jelly, as hydrated gelatine, albumen, mucus, or gelatinous starch; but the most useful septum is parchment paper in thin sheets and without sensible flaw or porosity. It is found that, through moist films or partitions such as those here named, through masses of different substances in the gelatinous state, or through liquids, very many and perhaps all substances capable of crystallization in definite forms make their way by diffusion at rates which, though differing for the different substances, are rapid in comparison with those at which any substance having itself the gelatinous or jelly-like condition can traverse or diffuse in the same media. These facts led Prof. Graham to divide the great body of chemical substances (especially compounds) into two classes, which are readily characterized by the tendency of the former to crystallize definitely, either alone or in combination with water, and to dissolve rapidly and generally in solutions free from viscosity; while the latter when dry incline to the vitreous structure, having little tendency to crystallize, dissolve slowly or only soften, and as a rule assume the viscid or gelatinous state. To these classes, respectively, he gives the names of "crystalloids" and "colloids" (the latter from the Gr. *κόλλα*, glue). In experiments such as those already referred to, the paper sized with starch, or other film or membrane containing a jelly or viscid material of any sort, is a colloidal partition or body; and the colloid gum has very slight power to penetrate it. This is found true also of such substances as hydrated silicic acid, a number of hydrated metallic peroxides, starch, vegetable gums, dextrine, caramel, tannin, albumen, and vegetable and animal extractive matters, all of which are colloids. The crystalloids, however, as cane sugar, and a large number of chlorides, sulphates, &c., of metallic bases, readily penetrate the colloidal

partitions or media; and the explanation given is, not that either class of substance is afforded or denied passage through any effect of capillary attraction as ordinarily understood, but that, the affinity of any colloid for water being of the feeblest character, one colloid cannot with any rapidity abstract molecule for molecule the water from another, by which process it could be conveyed through it; while the crystalloids brought in contact with a moist colloid, having a high affinity for water, can displace the colloid from solution particle by particle, and thus make their way through its mass. These results are beautifully shown by placing at the bottom of two glass jars respectively, in a little starch jelly and then surmounted with several inches depth of the same jelly, a colored crystalloid, as bichromate of potash, and a colored colloid, as caramel; the gradual elevation of the former through the mass can be daily observed, while at the end of eight days the caramel has scarcely begun to discolor the jelly above its first position. The different rates of diffusion through such septa allow of the employment of the method thus discovered for separating, in degree or partially, one from among two or more crystalloids existing in mixture, but more readily and satisfactorily a crystalloid from a colloid. To this peculiar mode of separation Graham gives the name dialysis. It is conveniently effected with a "hoop dialyser," a sheet of parchment paper stretched beneath a hoop, and secured about it in the manner of a sieve. The sheet being moistened, and receiving in it a very thin layer of the solution from which some substance is to be separated (the separation being more rapid as the layer is thinner), is floated on a sufficient body of water in a larger vessel. To separate in degree two or more crystalloids, the simpler method of "jar diffusion" often suffices. The mixed solution of crystalloids is conveyed by use of a pipette, so quietly as to leave the superincumbent liquid quite undisturbed, to the bottom of a jar of water or alcohol, and left at rest; the most diffusible substance rises most rapidly, and is more entirely separated from the others as the time is greater, and the height to which it ascends through the column increases. By carefully drawing off with a siphon, at the end of the experiment, successive strata of the liquid into separate vessels, and quantitatively analyzing their contents, the quantities of the "diffusates" in the strata from below upward, and so the diffusibilities of the substances, are determined. Thus, with 10 per cent. solutions in pure water, introduced to the bottom of separate vessels, beneath 4.38 in. of pure water, 1 per cent. of common salt in solution had at the end of 14 days reached the uppermost of 16 strata of equal depth in the column; while in the same time sugar had barely appeared (.005 gramme) in the uppermost stratum, gum had diffused itself to the tenth stratum, and tannin to the ninth, from the bottom. By such means, with

proper care and noting of conditions, the absolute and comparative diffusibilities of substances can be determined. Hydrochloric acid and the allied hydracids are found to be the most diffusive substances known; the solid chlorides are high in the scale, and of these apparently chloride of sodium highest. As an illustration of the results of series of experiments, the approximate times of equal diffusion of the following substances were found as here given: hydrochloric acid, 1; chloride of sodium, 2.33; sugar, and sulphate of magnesia, 7; albumen, 49; caramel, 98. When two or more diffusible substances are mixed, the difference in their rates of diffusion is increased, and effective analysis by diffusion is thus favored. The rate of diffusion is much accelerated by elevation of temperature of the liquid or mass, so that separations may be effected in less time at high temperatures; but the degree of separation is less, since at the same time the less diffusible substances gain in the higher ratio. The rate of diffusion of all substances is less in alcohol, and probably in most other liquids, than in water, or in semi-fluid masses rendered such by water. The name "diffusate" has been given to any substance as diffused, or separated by dialysis.—The relations and applications of the new facts, and the principle which is their basis, are numerous, and some of them of high importance. The dialyser affords an advantageous method for completely purifying soluble colloids without risk of decomposition, by the readiness with which all crystalloid substances pass from them into water; and Prof. Graham in his paper ("Philosophical Transactions," 1861, part i., p. 183) gives directions for the preparation and purification of many substances of this class. Besides the distinctions already referred to, it will be observed that crystalloid bodies tend to aggregate in plane films and with angular outlines, and are hard and solid; while the more usual condition of the colloid is that showing rounded outlines, a homogeneous mass, with more or less softness and toughness of texture. The water of crystallization in the former is represented by water of gelatination in the latter. The colloids are usually insipid; the crystalloids more commonly have a marked taste. Chemically, the former are the inert bodies; the latter, usually active, or energetic. But as observed in their most usual conditions, the rigid crystalloids are almost wholly unsusceptible to external impressions; while the soft colloids have a wide sensibility to external agencies, and thus great mutability of condition. Even the simply mineral colloids cannot long be kept without change—pure hydrated silicic acid, or soluble silica, sealed up tightly, undergoing change within a few days or weeks; and the existence of many of them is only in and during a continued metamorphosis. This is especially true of albumen, gelatine, mucus, and related substances, as existing in the fluids and living

tissues of the animal body. These colloids are plastic or nutritive, and apparently in good part because they are mutable or capable of those successive metamorphoses during which the conditions of vitality can be secured, and in turn vital force and action evolved and manifested. Thus, these elements stand physiologically in relations the reverse of those they show chemically; and Prof. Graham accordingly terms the crystalloid a statical, and the colloid a dynamical condition of matter. He suggests that the colloidal condition of matter may be looked upon as "the probable primary source of the force appearing in the phenomena of vitality;" while "to the gradual manner in which colloidal changes take place (for they always demand time as an element) may the characteristic protraction of chemicorganic changes also be referred;" in these intending to include, of course, the time required for application of the power of the will, for exertion of muscular force, and the physical changes that underlie the phenomena of sensation and thought. The facts observed in connection with diffusion appear to lead to a new understanding of endosmose, as effected, in part at least, by the circumstances that a colloid cannot abstract water from (or dehydrate) another colloid or a crystalloid, while a crystalloid can readily dehydrate a colloid, and in so doing effect its own movement through the latter.—The method of dialysis can be employed for the extraction of arsenic, tartar emetic, corrosive sublimate, strychnine, morphine, and other crystalline poisons in the stomach, blood, milk, or any organic mixture. The crystalloid poisons will pass through the septum into the outer vessel, where their presence can be shown by the usual tests. By it soluble albumen may be obtained in a state of purity, by addition of acetic acid, and use of a colloidal septum. Nitrate of silver, from photographer's waste, when put into the dialyser readily separates from the albumen and other organic impurities, and can thus be saved. As early as 1864 Mr. Whitelaw took out a patent in England for the removal of chloride of sodium and nitre from the brine of corned and salted meats by means of dialysis. Liebig has shown that the brine contains a large proportion of the nutritious constituents of the meat; and if we could remove the salts and evaporate the residue, we should have all of the properties of a good soup. This process is successfully accomplished by Mr. Whitelaw's apparatus, as the savory and valuable constituents of the meat are colloids, and will not therefore pass through a membrane. A further technical application of the doctrine of dialysis is in the extraction of sugar from the beet; and it has been proposed to apply the same method to the extraction of sugar from the cane. The contrivances employed by sugar refiners are called osmogenes, and they are now much used in Germany and France. Graham applied the principle of dialysis to the concentration of the

oxygen of the air. When air is passed through shavings of India rubber, the rubber retains a portion of the nitrogen, and the proportion of oxygen can be increased to 41 per cent. The proposition has also been made to separate substances which fuse at different temperatures by passing them through porous walls made of refractory material. This is called dialysis in the dry way.

DIAMAGNETISM (Gr. *διά*, through, and *μαγνήτης*, magnetic). In the native magnet (an ore of iron) resides a peculiar force, which, if a mass of this body be suspended freely, turns or directs it into a line nearly parallel with a meridian on the earth's surface, the same end of the magnet being always directed toward the north. Certain bodies, especially iron, brought near to a magnet, have the magnetic condition induced in them, the extremity nearer either magnetic pole becoming a pole of the opposite name, that more remote a pole of the same name. Small magnetizable particles, as iron filings, dusted upon a surface on which a magnet rests, or agitated near it, become arranged in lines which, between unlike poles that are presented to each other, run across in straight lines, while about those on either side they form curves, making larger and larger sweeps into space. The lines thus indicated have been named magnetic curves, or lines of force. Until recently the number of magnetic bodies was supposed to be very small. Becquerel in 1827 found that a needle of wood playing freely on a pivot took a direction across, not in, the magnetic curves; and in 1829 Le Bailly also observed that bismuth repelled the magnetic needle. But the significance of these facts was not understood until Faraday in 1845, in the course of his experiments on magnetic rotary polarization, observed that a bar of so-called "heavy glass," suspended between the poles of an electro-magnet, moved, as soon as by the passage of the electrical current magnetism was induced in the latter, into a position crossing the lines of force, or at right angles to the line joining the poles. Terming the position assumed by a soft iron bar, which is lengthwise between the two poles, or from one to the other, axial, Faraday gave to the new direction assumed by the glass the name of equatorial. The glass was not merely thus directed, it was repelled by either pole; and if, reduced to the form of a small mass or cube, it was thrown out of the lines joining the poles to one side or the other, it moved into the position of weakest magnetic action. He also sealed up various liquids in long tubes of thin glass, and suspended them between the poles; some arranged themselves axially, others equatorially. This new-found property of certain bodies Faraday termed diamagnetism; and in contrast with this he denominated the familiar form of magnetic action paramagnetism. His experiments warrant the conclusion that, with a sufficiently powerful electro-magnet, all substances whatever can be shown to

exhibit one or other of these properties. (See MAGNETISM.)

DIAMANTINA, a city of Brazil, in the province of Minas Geraes, capital of the ancient district of Tijuco, which was also formerly the name of the city, 270 m. N. of Rio de Janeiro; lat. 18° 28' S., lon. 43° 50' W.; pop. about 7,000. The city is built in amphitheatre on a steep acclivity, 5,648 feet above sea level. The streets are irregular, and the pavement indifferent; a few of the houses are fine, and the whitewashed walls of the others contrast prettily with the brilliant green foliage and golden fruit of the rows of orange and banana trees which surround almost every dwelling. Of the numerous churches some are handsome, especially the negro church dedicated to Nossa Senhora do Rozario, remarkable for a statue of a black Virgin surmounting the altar. Save in the public edifices, which are of stone, the building materials are mostly either mud or wood. There are three hospitals, barracks, a primary school, and a good market. Flowers, vegetables, and European fruits are cultivated in the gardens, of which one is attached to each house; and excellent water is supplied from crystalline springs. The inhabitants are mainly occupied in washing for gold and diamonds, both of which abound in the surrounding country. (See DIAMOND DISTRICT.)

DIAMOND (a contraction of adamant, from Gr. *α* privative, *δαμῆν*, to subdue), a gem so named on account of its extreme hardness, for which, and its brilliancy and beautiful play of prismatic colors, it excels all others. The diamond is pure crystallized carbon, and has a specific gravity slightly varying, according to the different qualities, as follows: Brazilian, colorless, 3.444; Brazilian, yellow, 3.519; oriental, colorless, 3.521; oriental, green, 3.524; oriental, blue, 3.525. Its hardness, according to an artificial standard scale, is 10, greater than that of any other known substance, that of corundum being 9, and that of quartz 7. The primitive form of the crystal, and that into which the secondary forms may be converted by cleavage, is the regular octahedron. The faces of the crystals are often convex, and the edges curved. The cleavage planes greatly facilitate its cutting, and also present the most brilliant natural surfaces. The gem is not acted upon by acids or alkalies, and when air is excluded may be heated to whiteness without injury. When exposed to the heat of a powerful galvanic battery, it fuses and is converted into a mass resembling coke, its specific gravity being sometimes reduced to 2.68. Its combustion may be effected in the open air or in oxygen gas, but it requires a very intense heat, which is scarcely estimable from the difficulty of using apparatus. Its combustibility was first proved by the Florentine academicians in 1694, by subjecting it to the solar rays concentrated in the focus of the large parabolic reflector made for Cosmo de' Medici, when it burned with a blue, lambent flame.—The diamond is found in alluvial de-

posits which are worked for gold, sometimes attached to loose pieces of brown hematite, and sometimes in a conglomerate of quartz and chalcedony, cemented by ferruginous clay; but it is not certain in what geological formation it originated. Generally in regions where the diamond is found there also occurs a laminated granular quartz rock, called itacolumite, of talcose formation, and which in thin plates is more or less flexible. According to M. Denis, it is found in Minas Geraes, Brazil, in two different deposits: one, called *gargulho*, which is composed of pieces of broken quartz, covered by a thin bed of earth; and the other, called *cascalho*, composed of quartz pebbles, united by ferruginous clay, and usually resting on talcose clays, the whole being débris from talcose rocks. The first is said to yield the finest diamonds, and both contain gold, platinum, and magnetic iron. The diamond mines of India have the same character as those of Brazil, the alluvial earth being a conglomerate of more or less tenacity, which requires to be broken up. The diamond was long known in Asia, in Hindostan, Borneo, Sumatra, and in the Ural mountains, before it was discovered elsewhere; the district from Cape Comorin to the bay of Bengal, including the famous mines of Golconda, furnishing the world until 1728, when the Brazilian mines were discovered. (See DIAMOND DISTRICT.) The South African diamond fields were discovered through some children finding a diamond of $2\frac{1}{4}$ carats on the banks of the Orange river, in 1868. In 1869 the "Star of South Africa," of $83\frac{1}{2}$ carats, was found by a Griqua shepherd; and on the borders of the Vaal river several small stones were found early in 1870. Since then the search has increased, until now there are said to be more than 4,000 persons, over an extent of nearly 1,500 sq. m., chiefly in the valleys of the Orange and Vaal rivers and at their junction, between lat. 26° and 28° S., and lon. 24° and 26° E. The diamonds are found, from the surface to a depth of 70 ft., in an alluvial calcareous earth, with rolled pebbles of quartz, chalcedony, jasper, and garnets, and decomposed feldspathic and micaceous rocks, resting on carbonaceous shale. The peculiarity of the African diamond is the great number of stones of 80 carats and upward, with a preponderance of 90 per cent. of yellow-tinted. The commercial effect of such a quantity of yellow diamonds coming at once on the market has been to depreciate their value in an extraordinary degree, large yellow stones being now but one fourth the price they were five years since; small stones are not quite one half their previous value. The whole of the South African diamond region, about 17,000 sq. m., was annexed in 1871 as a colony of Great Britain, under the title of Griqualand. Recently the Brazilian fields have ceased to be profitable, and many of the mines are abandoned, few retaining the full number of workmen; and even

the South African fields are said to be declining. In the United States, diamonds have been discovered in Rutherford co., N. C., and in Hall co., Ga.; also at Paris mine, Franklin co., N. C.; and at the village of Manchester, opposite Richmond, Va.; in California, at Cherokee ravine, in Butte co.; at Forest hill, El Dorado co., one of $1\frac{1}{2}$ carat, and at French Corral one of $1\frac{1}{4}$ carat, have been found. In Australia, they have been met with in the valley of the Turon, in the bed of the Macquarie river, at Victoria, and at Fremantle in Western Australia.—Diamonds are found of various colors, as well as colorless and perfectly transparent. The latter are most esteemed, and are distinguished as diamonds of the first water from their semblance to a drop of clear spring water. When of a rose tint and of clear water, they are also highly valued. A yellow shade is objectionable, as is a cinnamon color, a stone having these rarely being clear and sound. Next to the rose, a green color is the least objectionable; many very fine diamonds have this tint; and some are found of a bluish color, and some black. For the valuation of diamonds an arbitrary rule has been given, which is, however, little regarded in actual sales of the most costly of these gems. Purchasers for such being few, the only real rule adopted, as in the sale of many other commodities, is to demand the highest price there is the least probability that one may be induced to pay. The mere statement of the rule is sufficient to show its indefiniteness. It is to multiply the square of the weight in carats by a sum varying according to the state and quality of the stone. If clear and of good shape, this sum was £2; if perfect and well cut, £6 or £8 for the brilliant or rose, but a lower figure for the table. The rate is now \$50 in place of the £2 above, and a specimen brilliant is worth \$200. For diamonds of moderate size the rates vary as little as those of exchange between countries. They follow from the natural proportions in which diamonds are found. Diamonds weighing over 10 carats have a higher proportional theoretical value than the smaller sizes; yet the latter can commonly be sold at higher proportional rates, on account of the few purchasers for those of large size. In the great sale of jewels in London in 1837, on the distribution of the Deccan booty obtained by the army of the marquis of Hastings, the splendid Nassuck diamond, weighing $357\frac{1}{2}$ grains, and of the purest water, brought only £7,200. In December, 1858, £33,000 was paid for a stone weighing 61 carats, and £15,000 for a pair of drop-shaped diamonds for earrings. The finest gems of commerce are now in great part supplied by the old jewels of Portuguese, Spanish, French, and English families, the proportions from each nation being in the order named; and the best market for them is now the United States.—The origin of the art of cutting diamonds in a scientific manner is ascribed to Louis Berquen in 1456, who established a

guild of diamond cutters at Bruges about the year 1470. Three large rough stones were intrusted to him by Charles the Bold, duke of Burgundy, for the cutting of which he received 3,000 ducats. Diamond cutting was for a long time a monopoly in Holland, and the business is at the present day mostly confined to Amsterdam. The process, which consists of grinding down the surfaces as well as cutting, is slow and tedious, and being done by hand, occupies for a single stone the continual labor of months. The Pitt diamond required two years for the completion of the process. Two diamonds are employed, each cemented into the end of a stick or handle. The stones are then rubbed together with a strong pressure, being held over a metal box having a double bottom, the upper one perforated with small holes, through which diamond dust falls. This is afterward carefully collected, mixed with vegetable oil, and used for polishing the gem upon a revolving cast-iron disk. When a large piece is to be removed from the stone, it is sometimes cut off by means of a steel wire covered with diamond powder, and sometimes by the use of a chisel and hammer, though in this way there is danger of destroying the stone. The workmen should understand perfectly the position of the cleavage planes, as it is only upon them that pieces can be removed by the chisel. The forms usually adopted in cutting the diamond are the brilliant, the rose, and the table. The first shows the gem to the best advantage. It is composed of a principal face called the table, surrounded by a number of facets which are cut upon that part of the stone which shows above the setting, and which is called the bezel. The greatest circumference forms the girdle, and below this is the pavilion, which should have a depth equal to one half the diameter of the gem at the girdle. The pavilion is terminated by a small facet, called the culet, which may be either square or octagonal. As the brilliant is the most economical of material, and shows the stone most advantageously, it is usually preferred to any other. The rose, which is very brilliant, is flat below and cut into facets entirely over the upper surface. The table is least beautiful, and is used mostly in India for thin stones with a large surface, which are ornamented by being cut into facets at the edges.—Among the most celebrated diamonds known, that obtained by Mr. Pitt, governor of Madras, is perhaps one of the finest and most perfect. It is known as the regent. Its weight before cutting was 410 carats, and by this process, which occupied two years, it was reduced to 136 carats, and was purchased by the regent duke of Orleans in 1718 for \$675,000. Its present value is estimated at \$1,000,000. It was placed by Napoleon in the hilt of the sword of state, and was captured by the Prussians at Waterloo. A splendid diamond found in Brazil some years ago, and carried to France, is called the "Star of the South." It weighs in its rough state 254½ carats. Its general form

is a rhomboidal dodecahedron, and upon its faces are impressions which appear to have been made by other diamonds, so that the whole was probably a group of diamond crystals. The famous diamond in possession of the king of Portugal is also from Brazil. If genuine, of which there is some doubt, its value, according to the rule of computation, should be \$28,000,000, weighing as it does in the rough 1,680 grains. The famous Koh-i-noor or "Mountain of Light" is now in possession of the queen of England. This stone, interesting alike for its historical associations and for its intrinsic beauty, was, according to Indian tradition, obtained before the Christian era from one of the mines of Golconda. From the rajah of Oojein, who seems to have possessed it at the beginning of the Christian era, it passed to successive sovereigns of central India, and in the early part of the 14th century was added to the treasures of Delhi by the Patan monarch Aladdin. It remained in possession of the ruling families of the empire until the irruption of the Persian conqueror Nadir Shah, who saw it glittering in the turban of the vanquished Mohammed Shah, and proposing an exchange of head dress as a mark of friendship, bore it away with him, and gave it the name by which it is still known. After the assassination of Nadir it passed through the hands of Ahmed Shah of Cabool to Shah Shujah, who paid it as the price of his liberty to his conqueror Runjeet Singh, the "Hon of the Punjaub," in 1813. On the annexation of the Punjaub to the East India company's territory in 1849, it was stipulated that the Koh-i-noor should be surrendered to the queen of England, to whom it was accordingly delivered by the company, July 3, 1850. At this period its weight was 186 carats. It was exhibited at the crystal palace in London in 1851, where it attracted universal attention; but its display of colors was inferior to that of its glass model, and it was necessary to surround it with a number of vivid lights to develop its colored refractions. An examination was made by scientific gentlemen, among them Sir David Brewster, with reference to the propriety of recutting the gem. After obtaining the opinions of skilful cutters at Amsterdam, it was decided that the attempt should be made, and it was given in charge of Mr. Coster of that city, who afterward cut the Star of the South. The diamond so long in possession of the sultan of Matan, of the island of Borneo, is remarkable for its size and purity. It weighs 367 carats, and should be worth at least \$3,500,000. It is shaped like an egg with an indented hollow in the smaller end. It was discovered at Landak. The Orloff diamond, purchased for the empress Catharine II, of Russia, is about the size of a pigeon's egg, and weighs 195 carats. It is said to have formed the eye of a famous idol in a temple of Brahma at Pondicherry. A French deserter robbed the pagoda of this valuable stone. After passing through the hands of various purchasers, it came into the possession

of a Greek merchant, who received for it from the empress \$450,000, an annuity of \$20,000, and a title of nobility. The Austrian diamond is of a beautiful lemon color, and cut in rose; its weight is 139 carats. Its value is less than it would be but for its color and the form in which it is cut, ranking as worth \$500,000 instead of \$750,000. The most valuable diamond found in the United States was picked up by a workman at Manchester, on the banks of the James river, opposite Richmond, in 1856. The locality is in the tertiary formation, and the diamond originally belonged, no doubt, to the gold region up the river. It is of curvilinear octahedral form, specific gravity 3.503, and weighs 23.7 carats. It is lightly chatoyant, and would probably cut white; but an original flaw was increased by the rough treatment it received from those into whose hands it fell, so that its value was greatly deteriorated.—The process of collecting diamonds is similar to that of collecting gold in the alluvial deposits. The coarse gravel and rolled pebbles derived from the primary and metamorphic rocks form the lowest stratum among the sands and clays of the alluvium. This stratum, resting upon the surface of the rock, is the repository alike of gold and of diamonds. It is laid bare in the beds of the streams, when these cease to flow in the dry season, or are drawn off by sluices made for the purpose. From these beds, as well as from excavations in the bottom, the gravelly conglomerate or *cascalho* is removed, to be washed when convenient. This in Brazil is usually in the rainy season, and the work is done in a long shed, through which a stream of water is conveyed, and admitted into boxes in which the *cascalho* is washed. A negro works at each box, and inspectors are placed to watch the work, and to prevent the laborers from secreting the diamonds. It is the custom to liberate the negro who finds a diamond weighing $17\frac{1}{2}$ carats. Dr. Beke, in a paper read at a meeting of the British association, relates that a slave in Brazil seeking for diamonds in the bed of a river broke with his iron bar through a crust of silicious materials, cemented together by oxide of iron, in which he discovered a bed of diamonds, which were afterward sold for \$1,500,000. This immense quantity, being carried to England, so overstocked the market that few of the English houses were able to stand up against it.—Besides their use as ornaments, diamonds are applied to several practical purposes. An impure diamond, but very hard, and colored black, known under the name of bort, is used for arming the bits of the diamond drill (see BORING), and is also crushed to fine powder in a steel mortar, and used for coating the metallic disks employed by lapidaries for producing flat surfaces on precious stones of great hardness. The fine splinters are made into drills, for piercing small holes through rubies and other hard stones. The property possessed by the diamond of cutting glass is due not merely

to its extreme hardness, but to the peculiarity of its crystallization in rounded faces and curvilinear edges. The natural crystal only is suitable for this purpose.—The diamond exhibiting the physical properties of matter in their highest state of perfection, and proving after all to be of the simplest chemical composition, it has been a matter of no little scientific interest to study the peculiarities of its construction, and to determine if possible the secret processes by which nature has elaborated the most perfect gem from so homely a substance as charcoal. Its high value has stimulated these researches, in the hope of individual profit by its artificial production. But though more complicated forms of matter have been successfully reproduced, carbon has not yet been made to attain the simple perfection of the diamond, unless it be in crystals invisible to the naked eye; nor have we yet learned from what department of nature's works the material has been taken, that has been so beautifully perfected. The vegetable kingdom may have furnished it, after itself receiving it from the atmosphere, or it may have been unlocked from those repositories of carbon shut up from remote geological periods in the carbonic acid of the calcareous rocks, or from such collections of fossilized plants as are now seen in various stages of change to mineral substance. But if the direct object of these researches has not been attained, the forces which have acted upon it to give to it some of its peculiarities have been partially determined, as also a previous condition in which it must have existed. Sir David Brewster, from the exhibition of polarized light around the minute and irregular cavities in diamonds, has concluded that the substance has once been in a soft state, and compressed in these parts by the expansive action of a gas or fluid contained in the cavities; and as various circumstances indicate that this softness was not the effect of either solvents or heat, he is of opinion that, like amber, the diamond is a vegetable substance, slowly consolidated into a crystalline form. The nearest approach to its reproduction has been in the experiments of M. Despretz. By long continued voltaic action, carbon free from every trace of mineral substance, prepared from crystallized sugar candy, was made to deposit microscopic crystals in black octahedrons, in colorless translucent plates, the whole of which had the hardness of the powder of the diamond, and which disappeared in combustion without leaving any perceptible residue. Being, however, only in powder, it was impossible to isolate and weigh these crystals, or to determine their index of refraction and angles of polarization. It is said that a similar result has been obtained by decomposing a mixture of chloride of carbon and alcohol by galvanic currents continued for six months.—The principal English works on the subject are D. Jeffrey's "Treatise on Diamonds and Pearls" (8vo, London, 1750); J. Mawe's "Treatise on Dia-

monds and Precious Stones" (8vo, London, 1826); and "Diamonds and Precious Stones" by Harry Emanuel (12mo, London, 1867; New York, 1873).

DIAMOND DISTRICT (Port. *Distrito Diamantino*), a district in Brazil, so called from the diamond grounds for which it has long been celebrated, situated in the Serra do Frio, in the province of Minas Geraes. It extends from E. to W. between lat. 17° and 19° S., and is watered by the Jequitinhonha and several tributary streams of the Rio São Francisco. In 1725 Sebastião Leme do Prado discovered the Manso, a small affluent of the Jequitinhonha, and found some white stones which were sent as specimens to the court of Portugal, where, however, they at first attracted little attention. After an interval of three or four years, Bernardo da Fonseca Lobo penetrated into the hitherto unexplored serras, and discovered similar stones, one among which was of extraordinary size; but as no one knew the value of the gems, they were frequently used as counters at play. A certain *ouvidor* of the province, who had been in India, perceiving that they were diamonds, purchased a large number at a merely nominal price, and returned to Portugal, about the same time when Almeida, first governor of Minas Geraes, informed the court of the real nature of the stones. Adventurers hastened to profit by the discovery; but discord soon sprang up among them, and quarrels ensued which often ended in bloodshed. By letters patent, issued in February, 1730, the diamonds were declared crown property; but the liberty to continue the search for gems was purchasable at the rate of 20 milreis (\$10) for each negro engaged for the purpose. This impost was soon after increased to 40, and finally to 50 milreis. The crown profited little by these contracts; and in 1771 the government placed the management of the mining under the surveillance of officers specially appointed for the charge, employing at the same time 5,000 negroes at the works. A decree was issued prohibiting the search for gold within the limits of the diamond region, all the approaches to which were guarded by soldiers; while stringent laws were passed to provide for the registering of the inhabitants, the admission of settlers, the erection of inns and shops, and the punishment of infringements of the government monopoly. In pursuance of a law passed in 1873, the diamond mines now belong exclusively to private individuals. A singular uniformity has been observed respecting the diamond grounds of this district. The same cubic mass will yield in washing pretty nearly the same number of carats, whether of large or small diamonds. Though very large gems do not abound in Brazil, some of considerable dimensions have at times been found.—For the product of these diamond mines, see BRAZIL, vol. iii., p. 221; and for the mode of working them, see DIAMOND.

DIANA, an ancient Italian divinity, corresponding in most of her attributes with the Greek Artemis. Artemis was the daughter of Zeus and Leto or Latona, and the twin sister of Apollo, and the island of Delos is generally assigned as her birthplace. She represented as a female divinity the same idea that Apollo did as a male divinity, and like her brother sent plague and death among men and animals; but as Apollo was also the alleviator as well as the author of suffering, so she too was a preserving goddess, watching over the sick and aiding the unfortunate. As sister of the sun god, she was goddess of the moon; hence her identification in later times with Selene or Luna, and her Latin names Lucina and Phœbe. Unlike Apollo, she had nothing to do with music or poetry. She was the guardian of young girls and of women in childbirth, but was herself a virgin, and the ministers of her worship were vowed to chastity. As the goddess of the moon she wore a long robe and veil, with the crescent moon above her forehead. In Arcadia she was the patron of hunting and of sylvan sports, and as such she was represented with a bow, quiver, and arrows. She loved to dwell in groves and in the vicinity of wells, and to dance with her nymphs in the forest; and nearly all her surnames and epithets are derived from mountains, rivers, or lakes, indicating that she was the representative of some power of nature. In Tauris she was worshipped with human sacrifices, and in Sparta boys were scourged at her altar till it was sprinkled with their blood, a ceremony said to have been introduced by Lycurgus as a substitute for immolation. The Ephesian Artemis was the personification of the fructifying powers of nature, and was represented in her magnificent temple at Ephesus as a goddess with many breasts. The worship of the Roman Diana is said to have been introduced by the Sabines and Latins. A temple was erected to her on the Aventine by Servius Tullius, and the day of its dedication was celebrated every year by slaves of both sexes, and was called the day of the slaves. From this it is inferred that Diana was an inferior deity in Rome in the early days, and that her worship was not recognized by the ruling patricians; but whatever was her original character, she afterward became identified with the Greek divinity.

DIANA OF POITIERS, duchess of Valentinois, mistress of Henry II. of France, born Sept. 3, 1499, died at Anet, in Orléanais, April 22, 1566. At the age of 13 she became the wife of Louis de Brézé, count de Maulevrier, and grand seneschal of Normandy, by whom she had two daughters. She was attached to the court of Queen Claude, and when her father, the seigneur de St. Vallier, had been condemned to death for favoring the escape of the constable de Bourbon, she so touched the heart of Francis I. by her tears and beauty, that the punishment was commuted. In 1531

her husband died, and Diana, putting on widow's weeds, expressed a resolve to wear them till her death; but this did not prevent her when nearly 40 years old from becoming the mistress of the dauphin (her junior by nearly 20 years), afterward Henry II. The duchess d'Étampes then possessed the affections of Francis I., and the two favorites divided the court until the accession of the dauphin in 1547, when Diana became almost mistress of the kingdom, and her rival was sent into exile. The beauty and accomplishments of the young queen, Catharine de' Medici, could not prevail against her influence. The king delighted in giving public tokens of his infatuation, admitted her to his councils, and in 1548 created her duchess of Valentinois. She retained her ascendancy until Henry's death in 1559, when she retired to the palace built for her by her royal lover at Anet; but in 1561 she was recalled by Catharine de' Medici to exert her influence in detaching the constable de Montmorency from the Châtillons. From that time until her death she remained in retirement. Her power over the king, even when she had reached the age of 60, was due no less to her beauty than to her intellect. She spent large sums in charity.

DIAPHORETICS (Gr. *διαφορεω*, to carry through), medicines or agents which promote perspiration. (See PERSPIRATION.) The skin is one of the channels for the discharge of saline substances, and therefore these, particularly the salts of the alkalies, are promoters of the sudoriferous action of the skin. To facilitate their action, the skin should be kept warm and the body in a recumbent position. Bathing with tepid water, as tending to produce exosmosis through the glandular membrane, is also favorable. Among the most important diaphoretic saline medicines are tartar emetic, or the double tartrate of antimony and potash, the carbonates of soda, potash, and ammonia, and sulphate of potash, which is one of the constituents of Dover's powder. The tartar emetic is one of the most powerful, and may be used to assist the action of other diaphoretics by producing relaxation, and narcotics may be used for the same purpose. Among vegetable diaphoretics may be mentioned ipecacuanha, another constituent of Dover's powder, guaiacum, and camphor. It must not be forgotten that water, forming as it does nearly the whole of the perspiration, is perhaps the most powerful as well as safest of all diaphoretics, aided as it may be by warmth, exercise, and friction, and that it should nearly always form an important adjunct to the administration of medicinal diaphoretics.

DIAPHRAGM, the transverse muscle which separates the thoracic from the abdominal cavity in mammalian vertebrates. It is flattened, nearly circular, fleshy at the edges, tendinous in the centre, elongated, and ends in a point behind. In front it is attached to the ensiform cartilage of the breast bone, on the

sides to the internal surface of the last six ribs, behind to the transverse process of the first lumbar vertebra and to the bodies of the first three vertebrae of the loins by tendinous slips; the fleshy fibres of the last form the pillars of the diaphragm, and their fasciculi cross each other in such a way as to leave two openings, one superior and anterior, giving passage to the oesophagus and par vagum nerve, the other interior, for the passage of the aorta, thoracic duct, and vena azygos; the tendinous centre has been compared in shape to a leaf of clover. Between the middle and right portion of the tendinous centre is the opening for the passage of the inferior vena cava. The diaphragm is in relation, above, with the pericardium in the middle, and with the pleurae, base of the lungs, and walls of the chest on the sides; below, with the aorta in the middle, the kidneys, renal capsules, pancreas, and duodenum; on the right side with the liver, and on the left with the stomach and spleen. The direction of the posterior fibres is nearly vertical; all the others converge toward the tendinous centre. The diaphragm is the great muscle of respiration; when it contracts, its central ten-

The Diaphragm viewed from the Lower or Abdominal Side. *V. C. I.*, the vena cava inferior; *O. E.*, the oesophagus; *Ao.*, the aorta; *Th. D.*, the thoracic duct, cut where they pass through the diaphragm, the broad white tendinous middle of which is easily distinguished from the radiating muscular fibres which pass down to the ribs and into the pillars in front of the vertebrae.

dinous portion is drawn downward, the cavity of the chest is enlarged, and air rushes in to expand the lungs during the act of inspiration; when forcibly contracted, it may act as an assistant to the abdominal expiratory muscles by diminishing the size of the base of the chest; by its action on the abdominal viscera it aids in the expulsion of faeces and urine; in ordinarily tranquil breathing the diaphragm is sufficient for the performance of the function. In animals the extent and position of the diaphragm vary according to the number of the ribs; in those whose ribs extend nearly to the pelvis, as in the horse, the thoracic convexity of the diaphragm is much greater than in man.

This important muscle is liable to malformations, wounds, and morbid conditions; its total absence is incompatible with any other than intra-uterine life, as aerial respiration would be impossible; its partial absence, like dilatation of its natural openings, or laceration of its fibres, is accompanied by the passage of more or less of the abdominal viscera into the chest, impeding the action of the heart, lungs, and digestive organs; in such cases, the liver, stomach, omentum, ileum, cæcum, and part of the colon, have been found above the diaphragm. This partition is also liable to penetrating wounds, and to rupture from external violence, the latter being the most dangerous; in either case, nature alone can remedy the evil. It is sometimes inflamed, and in the rheumatic diathesis is the seat of the most acute pain, increased by every respiratory act, and forcing the patient to breathe almost entirely by means of the abdominal muscles. Spasmodic contractions are familiarly known by the phenomenon of hiccough; this is sometimes merely a nervous affection, and at others is a symptom of peritonitis, strangulated hernia, and other abdominal diseases.

DIARBEKIR, or *Diarbekr*, also called *Diarbek-Amid*, and *Kara-Amid* (anc. *Amida*), a town of Turkey in Asia, capital of a vilayet of the same name (Turkish Kurdistan), on a rocky eminence a short distance from the right bank of the Tigris, in lat. 37° 55' 30" N., lon. 39° 52' E., 155 m. S. S. W. of Erzerum. A fertile and well cultivated plain surrounds the city, which is encompassed by walls pierced by four gates, and surmounted by many towers. In the N. E. portion are the ruins of the citadel, formerly the residence of the pasha. It was once a very flourishing place, and contained, it is said, 400,000 inhabitants in 1750; but owing to the predatory disposition of the Kurds, who have rendered unsafe the intercourse with Bagdad and Aleppo, its prosperity has declined, and it now contains only about 35,000, chiefly Mohammedans and Armenians. It is the seat of an Armenian archbishop and three Catholic bishops (united Armenian, Chaldean, and united Syrian). Some trade is carried on with Aleppo, and the manufacture of cotton and silk goods, though much diminished, is still continued. The streets are narrow and dirty, and most of the houses are of rough stone covered with a plaster of mud and straw. It contains many mosques, an Armenian cathedral and other Christian churches, numerous baths, caravansaries, and bazaars, and is well supplied with water, which is introduced by a fine aqueduct, and distributed through the city in numerous stone fountains. The walls are built of a dark-colored basalt, quarried in the neighborhood, and many of the principal buildings are of the same material.—*Diarbekir*, then called *Amida*, was enlarged and fortified by Constantine. On the invasion of Mesopotamia by the Saracens it fell into their hands. At the end of the 14th

century it was pillaged by the Mongols under Tamerlane, and in 1515 it was captured by Sultan Selim I.

DIARRHŒA (Gr. *διαρρῆν*, to flow through), a disease characterized by frequent loose alvine discharges. In a proper system of nosology diarrhœa would scarce find a place; it is a symptom rather than a disease, and is produced by a number of different pathological conditions. It is present in the course of typhoid fever, is a frequent accompaniment of phthisis, and is sometimes an attendant upon albuminuria and other forms of blood poisoning; it is caused by inflammation and ulceration of the bowels. Those slighter forms of the complaint only will be noticed here which are independent of constitutional causes, and which are produced by a temporary irritation or sub-inflammation of the intestinal mucous membrane. Diarrhœa is often caused by the use of crude and indigestible food, or even by food ordinarily wholesome taken in too great quantity or variety. Fruit, particularly when acid and unripe, uncooked vegetables, as cucumbers and salads, food in a state of incipient decomposition, the flesh of immature animals, as young veal, &c., are all liable to act upon the bowels. Certain articles, as mushrooms, shellfish, the richer varieties of ordinary fish, as salmon, from peculiarity of habit disagree with particular individuals and produce diarrhœa. The same is true of a total change of diet; food perfectly wholesome to those accustomed to it, and the water used habitually in certain districts of country, often cause bowel complaints in the stranger. Emotions of the mind, particularly grief and anger, in some persons promptly occasion an attack of diarrhœa; others are affected in the same way by sudden changes of temperature, wet feet, or exposure to cold. Where diarrhœa is caused by the ingestion of food rendered irritating by its quantity or quality, the purging itself soon removes the cause of irritation and the diarrhœa ceases; if this should not be the case, a moderate opiate or an anodyne combined with an astringent are all that is necessary. When diarrhœa is dependent on exposure to cold, a bland, unirritating diet, the warm bath, and the use of opium or of opium and ipecacuanha in small doses, may be had recourse to; in such cases the patient is generally benefited by wearing a flannel bandage around the abdomen.—Infants at the breast sometimes suffer from bowel complaint; here it is commonly caused by over-feeding. Ordinarily nature provides against this by the facility with which the infant vomits; the stomach frees itself from the excess of food, and no mischief is done; but when the infant does not vomit, diarrhœa is caused, and undigested curd is present in large quantity in the evacuations. The obvious remedy is the prolongation of the intervals at which the child is suckled. During dentition in infants, from the large quantity of blood sent to the digestive organs, and the rapid evolution which they are

undergoing, the bowels are irritable, and diarrhœa often supervenes; this is best guarded against by care in the diet and a proper observance of hygienic regulations.—A popular remedy for diarrhœa, especially in cases which precede an attack of cholera, is a mixture of equal parts of laudanum, tincture of rhubarb, spirits of camphor, tincture of capsicum, and essence of peppermint, taken in doses of 20 to 30 drops in a little water at frequent intervals until relief is afforded. (See CHOLERA.)

DIAS, A. Gonçalves, a Brazilian poet, born in Caxias, Aug. 10, 1823, died at sea in 1864. He was educated in Portugal, and returning to his native country published a volume of poems entitled *Primeiros cantos* (Rio de Janeiro, 1846), which was followed by his drama of *Leonor de Mendonça*, *Segundos cantos*, and *Ultimos cantos*. In 1848 he was chosen professor of national history in the college of Dom Pedro II. In 1855 he was sent by the government to study the scientific institutions of France and Germany. Returning to Brazil in 1858, he was appointed historian and ethnographer to the expedition sent by the government to explore the provinces bordering on the Amazon. In consequence of his arduous labors in this expedition he visited Europe in 1862 to restore his health. In September, 1864, he embarked for Brazil, and died near the coast. Dias published the first four cantos of an American epic, *Os Tymbiras* (Leipsic, 1857), and a *Diccionario da lingua Tupy, chamada lingua brasileira* (Leipsic, 1858). A collection of his poems, under the title *Cantos*, was published at Leipsic (4th ed., 1865). His poetry is popular in Brazil.

DIAS, Bartholomen, a Portuguese navigator, born about the middle of the 15th century, lost at sea, May 29, 1500, while on his way from Brazil to India. In 1486 he sailed on an expedition to explore the W. coast of Africa, and without knowing it was carried around the southern point of the continent and landed at the mouth of Great Fish river, where he discovered that he was on the E. coast. The stormy cape, which he doubled on his return in 1487, he called *Cabo Tormentoso*, a name which the king of Portugal changed into *Cabo de Boa Esperança* or Cape of Good Hope. He subsequently sailed on another African expedition under Vasco da Gama; and he commanded one of the vessels in the fleet with which Cabral discovered Brazil. It was on this expedition that he perished.

DIASTASE (Gr. *διαστυναι*, to separate), a peculiar principle which is formed during the germination of seeds. It is most abundantly produced in the cereals, particularly in barley. It is formed at the base of the sprout, by a change which takes place in the albumen within and about the germ by the action of the vitalizing principle which has been awakened within it by heat and moisture. For the mode of producing diastase, see BREWING. It may be extracted from malt by steeping in water at

about 80° F., when it will be dissolved together with an albuminous body. A pasty mixture is produced, which is pressed, and the liquor filtered and heated to about 170°, to coagulate the albuminous body, and again filtered. This filtrate contains the diastase, and may be used for obtaining the peculiar effects of that body; but to obtain it in a pure state it is precipitated from the solution by the action of absolute alcohol. It is a white, amorphous, flocculent substance, soluble in water and dilute alcohol, but insoluble in absolute alcohol, tasteless, and easily decomposed. Moistened starch, when subjected to the action of only a minute quantity of it (one part in 2,000, according to Payen and Persoz), at 150° F., soon becomes disorganized and converted into soluble starch, dextrine, and grape sugar. Diastase in solution changes so readily that it soon becomes acid and loses its power of transforming starch. It is destroyed by boiling its solution; an important fact, which is taken advantage of in the manufacture of dextrine, to arrest the transformation when the production of that substance has reached the greatest practicable amount, and also in the brewing of beer, for the purpose of preventing fermentation during the cooling of the wort. It has never been obtained in such a condition as to afford a satisfactory analysis. According to the above authorities, the amount of nitrogen varies, being less when the substance has been carefully prepared. From this fact, and from the convertibility of starch into glucose by several other substances, it has been suggested that instead of being a principle of definite composition, it is probably an albuminous compound, passing through a change or series of changes. This view is strengthened by the discovery, by Dubrunfaut, of another substance in malt, similar in its effects, which he has called maltine, and finds to be even more active than diastase; an equal quantity being capable of effecting ten times as much transformation. He also obtained a third but less active substance than diastase, and believes the latter and the other two substances to be the same body undergoing decomposition. The action of alcohol when used to precipitate the diastase destroys the so-called modifications.

DIATHERMANCY (Gr. *διά*, through, and *θερμα*, heat), permeability to the rays of heat. Diathermanous bodies have the same relation to calorific rays that transparent ones have to rays of light; and those bodies which are impermeable to rays of heat, or bear the same relation to it that opaque ones do to light, are called athermanous. It was long known that rays of heat from an intense source were capable of passing through certain transparent substances, like glass, in lines subject to the same laws of refraction as those of light; but it was not supposed that such transmission was possible through bodies which are opaque to light. Pictet of Geneva was the first to show that radiant heat, from obscure as well as from

luminous sources, would pass through plates of different transparent substances. But it was even then believed by many that the heat was communicated by being absorbed and subse-

Melloni's Apparatus.

quently radiated by the transmitting body, until Prévost of Geneva proved the fallacy of this idea by passing rays of heat through ice, of sufficient power to ignite combustible substances. The investigations of Melloni, however, placed the subject in a clearer light, and to him we owe most of the facts that other distinguished investigators (among whom are Bunsen, Kirchhoff, Tyndall, and Balfour Stewart) have elucidated by numerous brilliant experiments, which have given the subjects of radiant heat and light so much interest at the present time. The apparatus used by Melloni in his experiments on the diathermancy of various bodies is represented in the engraving. Nobili's thermo-electric pile, made of alternate layers of bismuth and antimony, represented at *a*, connected by copper wires with a delicate galvanometer *b*, constituted the thermometer employed by Melloni to measure the radiant heat transmitted through the substances experimented upon, and which he termed his thermo-multiplier. The transmitted rays were received upon one of the faces of the pile, and generated galvanic electricity in proportion to their quantity, which was indicated by the galvanometer. The body whose diathermancy was the subject of experiment was placed upon an adjustable stand at *c*, while two screens, *d* and *e*, one for excluding the rays of heat until the test should commence, and the other for limiting the pencil of rays, were placed between *c* and the source of heat, *f*, which might be a Locatelli lamp, a coil of incandescent platinum wire, a heated metallic ball, a can of boiling water, or any other body heated to the desired degree. During his investigations he made an important discovery, which has since been used to great practical advantage by Tyndall in many brilliant experiments upon the transmission of heat through gases and vapors, viz.: that rock salt is almost perfectly diathermanous to radiant heat from all sources, whether luminous or obscure. Indeed, he supposed it to be perfectly diathermanous, attributing the nearly constant loss of 7.7 per cent. of the heat falling upon it to reflection from the surface. In testing the diathermancy of liquids, Melloni

placed them in narrow troughs of thin glass, and measured their transmitting capacity by the difference in the amount of heat which passed through them when empty and when filled with the liquid. The following table shows the percentage of heat transmitted by several of the substances with which Melloni experimented, using four different sources of heat. The experiments were made by ascertaining the deflection of the needle of the thermo-multiplier when the rays from each source were passed through air, and, calling this amount 100, passing the rays from each source through the various substances, and noticing the deflection produced.

DIATHERMANCY OF SOLIDS.

SUBSTANCES, 1/8 of an inch thick.	Locatelli lamp.	Incan- descent platinum.	Copper at 752° F.	Copper at 212° F.
Rock salt.....	92.3	92.3	92.3	92.3
Sicilian sulphur.....	74	77	60	54
Fluor spar.....	72	69	42	33
Beryl.....	54	23	13	0
Iceland spar.....	39	23	6	0
Glass.....	39	24	6	0
Rock crystal, clear.....	33	23	6	3
Smoky quartz.....	37	23	6	3
Chromate of potash.....	34	23	15	0
Carbonate of lead.....	32	23	4	0
Sulphate of baryta.....	24	18	3	0
Feldspar.....	23	19	6	0
Borate of soda.....	18	12	8	0
Selenite.....	14	5	0	0
Tartrate of potash.....	11	3	0	0
Alum.....	9	2	0	0
Sugar candy.....	8	1	0	0
Ice.....	6	0.5	0	0

These results show that transparency to rays of light and permeability to those of heat, or diathermancy, although they accompany each other to a certain extent, do not do so proportionately. Rock salt, it is seen, is equally diathermanous to all the sources named in the table. It is found, however, to be not perfectly diathermanous to rays of extremely low refrangibility, as will be noticed further on. The difference exhibited by glass in transmitting heat from the different sources is very marked. Thus, while transmitting 39 per cent. of the rays from a Locatelli lamp, and 28 from incandescent platinum, it permits the passage of only 6 per cent. of those which are emitted from copper heated to 752° F., and is completely opaque to those issuing from copper at 212°. Again, clear rock crystal transmitted only 1 per cent. more heat from the Locatelli lamp than did smoky quartz, and no more from the other sources; a fact which shows how little heat is contained in the highly luminous rays of the spectrum. The low diathermancy of ice is here also shown; a property which adapts it, as well as the other forms of water, which share it in a like degree, to the various relations it sustains with organized life. The following table, also from Melloni, shows the amount of transmission by various liquids, the source of heat being an argand lamp with a glass chimney, and the liquids 1/8 of an inch in thickness, held in glass cells:

A remarkable fact in relation to the diathermancy of bodies is that rays of heat which have once been transmitted by a substance will readily pass through a second plate of the same material with little or no loss; that is, glass is nearly diathermanous to heat which has already passed through glass, and ice is nearly diathermanous to heat which has passed through water or ice, or a considerable depth of watery vapor. Another very important fact, intimately connected with the subject of molecular physics, is that all bodies, solids, liquids, and gases, are nearly athermanous to heat which is radiated by the same body. Thus, rock salt, which is nearly diathermanous to all sources of heat, absorbs most of the rays that are radiated by heated rock salt. Balfour Stewart found that a moderately thick plate of cold rock salt would stop three fourths of the heat radiated from a plate of rock salt. This fact is accounted for on the wave theory, by supposing that the rays of very low refrangibility, which are the ones radiated by this substance, have the power of exciting vibrations of the same wave length in the same material, and are therefore accepted or absorbed; whereas the rays of higher refrangibility, and consequently of shorter wave length, which most other bodies emit, are allowed to pass through rock salt because they have not the power, by reason of non-accordance, to set its particles into vibration. From the fact that this substance only radiates heat of low refrangibility, it would be concluded that when heated it would require a long time to cool, and also that it would accept radiant heat slowly, although it is readily warmed by conduction; and this conclusion is borne out by experiment. The absorbing and radiating powers of bodies are reciprocal and equal, as has been shown by the experiments of Sir John Leslie, Ritchie, and others. The diathermancy of a body may therefore be stated as inversely proportional to its power of radiation. Athermanous bodies, or those which are only slightly diathermanous, are more permeable to rays of high than to those of low refrangibility; consequently, if the luminousness of a flame is increased, although it may contain no more heat, it will radiate more through partially diathermanous media, as for instance moist air, glass, and alum. Again,

if its luminousness is decreased, these media will be more opaque to its rays; and if heat of still lower refrangibility is substituted for the flame, their opacity will be the more increased. The investigations of Tyndall on the heat-absorbing powers of various liquids and gases, or in other words their relative diathermancy, have also thrown much light on the subject of the molecular constitution of matter. He has shown that elementary bodies are generally much more diathermanous than compounds. This has been used as a remarkable evidence in favor of the wave theory of light, because by adopting it the phenomena of transmission and absorption are perfectly accounted for, and in no other way. Placing a solution of iodine in bisulphide of carbon in a rock salt prism, he found that it transmitted 99 per cent. of all the rays emitted by a body heated below luminousness. Converging the rays which were transmitted through the solution, he found them as effectual in producing combustion as if the transmission had not been made. Iodine is therefore diathermanous to rays of obscure heat. The elementary gases and their mechanical mixtures he found to be almost perfectly diathermanous, while compound gases and vapors are partially so, many of them transmitting only rays of high refrangibility, or those belonging to the luminous spectrum. The diathermancy of dry atmospheric air was found to be more than 250 times that of nitrous oxide gas, a chemical compound of the constituents of the air in the same proportion; and this he regards as one of the strongest proofs that the atmosphere is a mechanical mixture, and not a chemical compound. In experimenting upon the conductivity of different substances, Tyndall found that this property in a body was generally commensurate with its diathermancy, with one exception, which was that slightly diathermanous rock crystal was a better conductor than almost perfectly diathermanous rock salt. The latter substance has, however, a high conducting power; and it was found that rock salt, glass, calcareous spar, selenite, and alum maintained the same order of conductivity that they did of diathermancy in the experiments of Melloni. Some of the experiments made by Tyndall will be more particularly described in the article on HEAT. The object he had in view made it necessary to employ apparatus which would allow of the transmission of the rays of lowest refrangibility, because it is these that are especially interfered with by vapors and compound gases. His sources of heat were often metal surfaces heated with boiling water, or to a temperature far below redness, and the rays were passed through a tube whose ends were closed with plates of transparent rock salt. This tube could be exhausted before the gas or vapor was admitted, and the latter could be introduced through apparatus which excluded all moisture; so that many errors which have often affected the value of

previous experiments were avoided. The following table shows the relative absorption of radiant heat of several different elementary and compound gases, and the vast difference in the degree of diathermancy which they possess; the transmission was made through each of the gases at the common pressure of the atmosphere:

DIATHERMANCY OF GASES.

GASES.	Relative absorption.
Air.....	1
Oxygen.....	1
Nitrogen.....	1
Hydrogen.....	1
Chlorine.....	89
Hydrochloric acid.....	62
Carbonic oxide.....	90
Carbonic acid.....	90
Nitrous oxide.....	355
Sulphuretted hydrogen.....	390
Marsh gas.....	403
Sulphurous acid.....	710
Olefiant gas.....	970
Ammonia.....	1195

Although these gases are perfectly permeable to all the rays of the luminous spectrum, to those of the obscure heat which was employed in these experiments they exhibit a great difference of absorbing power, nitrous oxide gas absorbing 355 times and ammonia 1,195 times as much as dry air. If the tube had been closed with partially athermanous glass instead of diathermanous rock salt, no such results could have been obtained, as the glass would have sifted out nearly all the rays of low refrangibility before they fell upon the gases whose powers of absorption were the subject of experiment.—The investigations which have been made upon the subject of diathermancy have been of great advantage in arriving at theoretical conclusions in regard to the molecular constitution of matter. In undertaking to explain why radiant heat of low refrangibility passes so much more readily through elementary than through compound gases, the mind is obliged to form conceptions of the different conditions in which the atoms are arranged in these two classes of matter. In the elementary gas they must be so disposed as to allow the waves of heat to vibrate freely without accepting their vibrations, while in the compound gas they must be so arranged as to receive or unite with them, or, in common language, to absorb them. In one case, therefore, the mind conceives of the atoms as swinging in the ether singly, receiving but little motion from its vibrations; while in the other they are grouped together in compound masses or molecules, which offer more obstruction to the ethereal waves, and therefore transfer to themselves a corresponding degree of energy. Tyndall found the body ozone to be highly athermanous, a quality which greatly distinguishes it from common oxygen. It has been held that ozone is a compound of oxygen and hydrogen. Now, heat destroys ozone, leaving oxygen; but if it also

contains hydrogen, some aqueous vapor must also result from the disorganization of the ozone. This vapor remaining in the oxygen would impair its diathermancy. But the gas obtained by heating ozone is as diathermanous as oxygen obtained in the ordinary way; therefore it contains no aqueous vapor, and the ozone from which it was derived must be simply oxygen, with its atoms grouped together somewhat after the manner of a compound gas. The diathermancy of iodine to the obscure, and its opacity to the luminous rays, allows the visible to be divided from the invisible spectrum which lies beyond the red rays, by passing the light of an incandescent body through a hollow prism of rock salt containing a solution of iodine in bisulphide of carbon. The conclusion to be arrived at from a consideration of this fact is, in the opinion of Tyndall, that the luminous waves which are intercepted by the iodine are in accord with its dissolved atoms, and therefore can transfer their motion or energy to them. Transparency and diathermancy he therefore considers as synonymous with discord, and opacity and athermancy as synonymous with accord, between the waves of ether and those of the molecules of the body on which they fall, or through which they pass. The blackness of lampblack he ascribes to the accord between the vibrations of its atoms and the waves embraced within the luminous portion of the spectrum; and the luminous rays which it absorbs are the ones which it radiates when raised to a sufficient temperature. But lampblack is also diathermanous to the very extreme obscure rays of the spectrum; a fact which was shown by Melloni. Aqueous vapor, although perfectly transparent to the luminous rays of the spectrum, was found by Tyndall to be quite opaque to those of the dark spectrum. This is one of the most interesting facts connected with the whole subject of heat, and of the greatest importance, not only in a strictly scientific sense, but in its practical bearing upon questions of meteorology, and therefore upon the business of every-day life. The formation of clouds by the radiation and consequent loss of heat from vapor through the drier atmosphere above, as well as by the condensation produced by currents of cool air, and the formation of dew from the same cause, the equableness of moist climates and the cold of high mountains, could never have been well understood unless the subject of the comparative diathermancy of dry and moist gases, particularly of the atmosphere in its various hygrometric conditions, had been carefully investigated.

DIATOMACEÆ, minute plants growing in moist situations, in collections of fresh water or in the sea, consisting of frustules of various forms, the walls of which contain a large quantity of siliceous matter, and are often beautifully diversified and marbled by striae or by dots. Notwithstanding the general resemblance of these curious vegetations to the species of desmidiæ, they

are clearly made distinct by the flinty fronds, singular striation, and absence of green coloring matter. Agardh asserts that many of these organisms have as much affinity with the mineral kingdom as with the vegetable, being in fact vegetable crystals, bounded by right lines and collected into a crystalliform body, and having no other difference from minerals than that the individuals have the power of again separating from each other. As in the case of the desmidiæ, there are solitary species, and others grouped so as to form lines and membranes. In some, the production of new plants from spores presents the same dissimilarity between the young and the adult forms. There are also numerous genera which can be accurately distinguished not only by the difference of form or outline, but by their own peculiar striations, markings, and dots. In both the single and the associated species there is a distinct pellucid peduncle or footstalk. This is sometimes considerably dilated above, or else forked, sometimes repeatedly. In this case each frustule remains attached, the base dilating as may be required. This arrangement gives a fan-like appearance of great beauty.

Echinella flabellata, a fan-like marine diatom.

But in the thread-like species it is only the corners that remain attached; as no stem or footstalk is visible here, it has been conjectured that it exists only in those plants which have grown from spores or in the seedling forms. Certain channels or apertures are so arranged as to convey the water to the inner cellular membranes, and thus to afford nutriment. The same curious conjugation to be seen in other algaë has been detected in the diatomaceæ by Thwaites, and has been confirmed by Berkeley and Broome. It is computed that vast areas of solid earthy matter are due to the growth, presence, and decay of these minute organisms. Many of the most beautiful are found in the guano of commerce, doubtless swallowed in the food of birds, and still remaining in perfect preservation. In the United States, masses of several inches in thickness are found on the bottoms of ponds, composed of myriads of these organisms, which on being exposed to desiccation become as white and friable as chalk. Even peat bogs and meadows abound with them. The polishing powders sold under the name of tripoli are composed of these natural silicious frag-

ments. The soundings on the shores of Victoria Barrier, Australia, in water whose average depth is 1,800 ft., were found by Dr. Hooker to be invariably charged with diatomaceous remains. These fossil species are often so identical with recent ones, that it would be scarcely too extravagant to admit the assertion of Ehrenberg, that species are to be found in a living state in situations where they have been propagated from times far anterior to the existence of man. The United States are rich in the diatomaceæ, both fossil and living. In the tertiary infusorial stratum of Richmond, Va., Ehrenberg detected 20 genera and 46 species, of which all were also European excepting two. This group of American forms is of peculiar interest, because the strata at Richmond are decidedly of marine origin, and consequently give at once a general view of these marine microscopic forms along the North American coast. Of the perfectly free diatoms we have many species of *naviculaceæ* remarkable for beauty, symmetry, or delicacy, or else for their striations. The largest, most common, and most easily distinguished is *navicula viridis*, of an oblong outline, found in every ditch and pond. It can be detected in great abundance in the ashes of peat, and in the deposits of infusorial earths. Its length is about $\frac{1}{16}$ of a line. Several of a sigmoid outline are very remarkable for the delicacy of their striae, of which may be mentioned *pleurosigma Baltica*, *P. hippocampus*, but more particularly *P. angulata*. The lines of striation upon *Nitzschia sigmoidea* are about $\frac{1}{100,000}$ of an inch apart. In *fragilaria* we have long threads of frustules adhering with considerable firmness at their commissures; but in *diatoma* they adhere only at a single point, so as to form curious chains of divided or separated joints. Prof. Bailey describes *bacillaria paradoxa* as a very interesting species, presenting by its curious motions and its paradoxical appearance an object well calculated to astonish all who behold it. At one moment the needle-shaped frustules lie side by side, forming a rectangular plate; suddenly one of the frustules slides forward a little way, the next slides a little also, and so on through the whole number, each, however, retaining a contact through part of its length with the adjoining ones. By this united motion the parallelogram is changed into a long line; then some of the frustules slide together again, so that the form is then much like a banner. Similar motions are constantly going on, and with such rapidity that the eye can scarcely follow them. The cause of this motion is wholly unknown, but it is probably mechanical and not vital. Mr. Smith, in his work on the diatomaceæ, estimates this motion as being $\frac{1}{100}$ inch per second. In *meridion vernalis* we have one of the most beautiful of the freshwater diatoms. It consists of spiral or helicoidal chains, to perceive which the specimens must be tilted on edge. It occurs in immense quantities in mountain brooks, covering every sub-

merged stone, or twig, or spear of grass, in the early days of spring. Among the groups with vittate or ribbon-like fronds, we may notice *striatella arcuata*, occurring in vast quantities on

1. *Bacillaria paradoxa*. 2, 3. *Meridion vernale*.

the filiform marine algæ, and covering them so much oftentimes as to make them glitter in the sunbeams as if invested with crystals. In still another natural group, where the striae are no longer visible in the frustules or fronds, we find a multitude of microscopic objects, furnishing sources for fresh admiration whenever they are examined. In some of these the fronds, which are disciform, are marked with radiating lines, of which *coscinodiscus*, very common in a fossil state in the Richmond earth and elsewhere, is most beautiful. In *C. lineatus* the cellules of the frond form parallel lines in whatever direction they may be viewed, and *C. oculus iridis* gives curious colored rings. When perfect, the disk of *coscinodiscus* is covered with circular spots in rows corresponding with the radii. In consequence of this arrangement they also form beautiful spiral rows in other directions, so that the curves present no inconsiderable resemblance to patterns produced by engine-turning; at other times the spots are found to form three sets of lines, making angles of 60° and 120° with each other; and on others the spots are disposed without much apparent regularity, frequently having a star-like figure in the centre. The spots are so small on some of the disks as to be almost invisible even by the highest magnifying powers; on others they are quite large and hexagonal. In *podiscus Rogerii* (Bailey), the whole surface is so beautifully punctate that no engraving could do it justice. The most complicated markings on the *coscinodiscus* scarcely rival the elaborate ornaments of this truly elegant organism. It has proved very common in Virginia and Maryland in a fossil condition. The beauty of *isthmia obliquata*, detected in the mud of Boston harbor, can only be appreciated by ocular examination. The diatomaceæ enter largely into the food of the mollusca. Dr. Hooker found *dictyocha aculeata* in the stomachs of salpæ taken off Victoria Land, and remains of diatomaceæ occurred in the same ascidiuums examined between the latitudes of the N. tropic and 80° S. The medusæ are also in particular often filled with these forms.—See Bailey in “American Journal of Science and Arts,” vols. xlii, xlii;

“Proceedings of the Essex Institute,” vol. i., pp. 33–48, and vol. ii., pp. 70, 71; Kützinger’s *Species Algarum* (Leipsic, 1849); Smith’s “British Diatomaceæ” (2 vols. 8vo, London, 1853–’6); and Berkeley’s “Introduction to Cryptogamic Botany” (London, 1857).

DIAZ, Miguel, an Aragonese explorer, born after the middle of the 15th century, died about 1514. He took part in the second expedition of Columbus, and having arrived in Hayti in 1495, he became involved in a duel which forced him to flee to the southern part of the island, where he married the female ruler of an Indian tribe. From information given by her, and with the coöperation of Bartholomew Columbus, who was governor of the colony, he discovered the gold mines of St. Christopher, and afterward took a conspicuous part in the foundation of Nueva Isabella (now Santo Domingo) near them. He faithfully adhered to Columbus until his death.

DIAZ DE LA PEÑA, Virgile Narcisse. See p. 801.

DIAZ DEL CASTILLO, Bernal, a Spanish adventurer and chronicler, born in Medina del Campo, Old Castile, near the close of the 15th century. He went to seek his fortune in the new world in 1514, and joined the expeditions which sailed from Cuba to Yucatan under Fernandez de Cordova in 1517, and under Grijalva in 1518. He afterward attached himself to the fortunes of Cortes. In 1568 he was regidor of the city of Guatemala. When Gomara’s “Chronicle of New Spain” appeared, Diaz began his *Historia verdadera de la conquista de la Nueva España*, the object of which was to correct the many misstatements of his rival, and to claim for himself and his comrades a share of the glory which Gomara gave almost wholly to Cortes. The work was finished in 1558, and was first published at Madrid in 1632. An English translation by Lockhart appeared in 1844.

DIAZ DE SOLIS, Juan. See SOLIS.

DIBDIN, I. Charles, an English song writer and composer, born in Southampton in 1745, died July 25, 1814. He was the 18th child of his parents, who intended him for the church; but he studied music, and at the age of 16 went to London, where he at first supported himself by composing ballads for the music sellers and by tuning pianos. In 1763–’4 the opera of “The Shepherd’s Artifice,” written and composed by him, was produced at Covent Garden theatre, after which he appeared for several years as actor and composer. Among his most popular works were “The Padlock,” “The Deserter,” “The Waterman,” and “The Quaker,” produced at Drury Lane under the management of Garrick. Having quarrelled with the latter, he was for several years engaged in various theatrical speculations, and in 1789 instituted a species of musical entertainment, in which he was the sole author, composer, and performer. He called it “The Whim of the Moment.” So successful did the enterprise prove, that in 1796 he erected a small theatre

in Leicester fields, called Sans-Souci, in which he performed till 1805, when he retired from professional life. A pension of £200 was procured for him, of which in 1806 he was deprived by the whig ministry of Lord Grenville. The tory administration, which came into power the succeeding year, restored his name to the pension list, but his improvidence kept him in poverty until his death. His theatrical compositions, 47 of which are enumerated in the "Biographia Dramatica," amount to about 100. But his reputation rests mainly upon his songs, of which he wrote 900, or as some say 1,200. His nautical songs and ballads are among the finest in the language; and some of them, like "Poor Tom Bowling," written on the death of his brother Thomas, a sea captain, and "Poor Jack," are established favorites. They were set to simple and expressive melodies, and were exceedingly popular at the beginning of the present century. He published "A Complete History of the Stage" (5 vols. 8vo, 1795), an autobiography prefixed to a collection of his songs (4 vols. 8vo, 1803), and some miscellaneous works of no great value. A new edition of his songs, with a memoir by his son Thomas, illustrated by George Cruikshank, was published in London in 1850. **II. Thomas**, son of the preceding, born in London in 1771, died there, Sept. 16, 1841. He adopted the profession of his father, and for many years appeared before the public as actor, author, and composer. His songs and dramatic pieces are probably as numerous as those of his father, but are now comparatively forgotten. He published a "Metrical History of England" (2 vols. 8vo, 1813), and "Reminiscences" (2 vols., 1828). He died in poverty, while employed in compiling an edition of his father's sea songs, for which he received an allowance from the lords of the admiralty. **III. Thomas Frognall**, an English bibliographer, nephew of Charles Dibdin, born in Calcutta in 1776, died Nov. 18, 1847. He was educated at Oxford and studied law, but afterward took orders, and received the degree of doctor of divinity. In 1807 he became editor of a weekly journal called "The Director," and in 1809 published in the form of a dialogue his "Bibliomania," reprinted with great enlargements in 1811 (new ed., enlarged, 2 vols. royal 8vo, 1842). In 1818 he travelled abroad, and in 1824 was appointed rector of St. Mary's, Bryanstone square, which post he held until his death. In 1814-'15 he published, under the title of "Bibliotheca Spenceriana," an account of the rare books in Earl Spencer's library, to which he afterward added a description of the earl's seat at Althorp, and an account of the Cassano library purchased by him, the whole in 7 vols. 8vo. His principal works besides those above mentioned are: "Introduction to a Knowledge of rare and valuable Editions of the Greek and Roman Classics" (1802; 4th ed., entirely rewritten, 2 vols. 8vo, 1827); "Typographical Antiquities of Great Britain" (4 vols., 1810-

'19); "Bibliographical Decameron" (3 vols., 1817); "Bibliographical, Antiquarian, and Picturesque Tour in France and Germany" (3 vols., 1821); "Reminiscences of a Literary Life" (2 vols., 1836); "Bibliographical, Antiquarian, and Picturesque Tour in the Northern Counties of England and Scotland" (3 vols., 1838).

DIBRANCHIATES, a division of cephalopod mollusks, having two gills or branchiæ, an ink gland, and, with few exceptions, a rudimentary internal shell. The division includes the argonaut, cuttle fish, octopus, squid, and spirula, of living forms, and the extinct belemnites. All are naked-skinned except the argonaut or paper nautilus, the female of which has a single-chambered shell for the protection of her eggs, not connected with the body.

DICE (plural of die), small cubes of ivory, bone, stone, or wood, used in gaming. Each of their six faces is marked with a different number of points, from 1 to 6, in such a way that the numbers upon any two opposite sides together count 7. They are shaken and thrown from a box upon a table, and the game depends upon the number of points presented by the upper faces. This is one of the most ancient of games. Plutarch makes it an early invention of the Egyptians. Dice have been discovered in Thebes, made of bone or ivory, and similar to those in use at present. Herodotus ascribes the invention of this, as of all other games of chance, to the Lydians. It is alluded to by Æschylus and Sophocles. The chief distinction between the ancient and the modern game is, that in the former three dice were employed, and in the latter ordinarily but two are used. The Greeks gave to the various throws that were possible the names of their divinities and heroes, the best throw being called Aphrodite. This game was adopted by the Romans, and the example of some of the emperors, especially of Nero, gave it a dangerous popularity. Wealthy Romans during the declining period of the empire frequently staked their entire fortunes upon a single chance. It was introduced into France in the reign of Philip Augustus, and has continued a favorite game.

DICE (Gr. *Δίκη*), in Greek mythology, the goddess of justice, daughter of Zeus and Themis and sister of Eunomia (good rule) and Irene (peace). She appears as one of the Horæ, and as an attendant of the father of the gods, and in the tragedies also as an avenging and rewarding divinity. Her office was not only to punish injustice, but to reward virtue.

DICENTRA (Borkh.), the generic name of some showy herbaceous perennials, of which several species are found wild in the United States. Of these latter, a very delicate and singularly flowered one is *D. cucullaria* (De Candolle), called Dutchman's breeches, the form of the corolla, with its spurs, resembling that article of apparel suspended in an inverted position. These blossoms are cream-colored

tipped with white, and hang in a simple raceme upon a slender drooping scape, rising from the bosom of a set of tender, deeply cut, long-stalked leaves. Both flowers and leaves soon fade away on the approach of summer, and leave, often on the surface of the ground, clusters of little grain-shaped tubers, arranged in the form of scaly bulbs. A second species, called squirrel corn (*D. Canadensis*, De C.), has scattered, round, flattened tubers, as large as grains of Indian corn, to the resemblance to which it owes its name. Its flowers are greenish white, tinged with red, and possess the fragrance of hyacinths. It is found in rich woodlands. *D. eximia* (De C.), found in western New York and among the Alleghanies of Virginia, is larger than the others, with reddish-purple flowers on a compound, clustered raceme, and with the lobes of the leaves broadly oblong. *D. chrysantha* (Hooker and Arnott), a native of California, has large, showy, golden-yellow flowers, leaves

Dicentra cucullaria.

2 and 3 pinnately divided, glaucous, with linear, acute segments, and a stem 2 or 3 ft. high, leafy branching. But the most beautiful of all was introduced from Japan in 1846. From thick, brittle, fleshy roots rise early in the spring numerous stout hollow stems about 3 ft. high, bearing large, spreading, deeply divided, compoundly ternate leaves of a glaucous hue, like the tree pæonias, from the axils of which issue strong flower stalks, branching into axillary and smaller racemes, loaded with large, rosy blossoms, each flower being about an inch long. In the early stage of the inflorescence the buds have a deeper tint. Several weeks elapse from the commencement of the expansion of the first blossoms until the period of blossoming is over; but sometimes a few smaller racemes will appear again toward the end of the summer. This is *D. spectabilis*, popularly called "bleeding heart." Side shoots or cuttings taken off early in spring, and plant-

ed out, will flower in August and September; but for early forcing it is better to put them into pots, and suffer them to ripen away the foliage that has been produced in this condi-

Dicentra spectabilis.

tion, in preparation for another season, taking due care lest they strike their freely growing root fibres through the bottom of the pots. On the approach of severe frost, the pots should be placed under shelter, or put into the cellar, whence they are to be removed into a warmer atmosphere as they are needed for flowering. For early blossoming parlor plants there are few so easily prepared, or so sure of successful management, or which will so well reward any attention. The *D. spectabilis* thrives in any good soil, but that which is light, rich, and deep suits it best. By a curious error many writers call the plant *Dielytra*.

DICK, Thomas, a Scottish author, born near Dundee, Nov. 24, 1774, died at Broughty Ferry, July 29, 1857. He was educated for the ministry, and was settled at Stirling; but he relinquished his profession, and for ten years was engaged as a teacher at Perth. While there he wrote "The Christian Philosopher" (1823), which brought him considerable reputation. From this time he devoted himself to the writing of popular scientific works, which were not a source of much pecuniary profit to their author. He also delivered many popular lectures on scientific subjects. His works having had a large sale in the United States, a subscription was taken up for his benefit in this country some years before his death, and by this means, and the aid of a small pension from the British government, he was enabled to pass his latter years in comfort. Among his works are: "Philosophy of Religion" (1825), "Improvement of Society by the Diffusion of Knowledge," "Philosophy of a Future State" (1828), "Mental Illumination of Mankind" (1835), "Celestial Scenery" (1838), "Sideral Heavens" (1840), and "Telescope and Microscope" (1851).

DICKENS, Charles, an English novelist, born at Landport, a suburb of Portsmouth, Feb. 7, 1812, died at Gadshill, near Rochester, June 9, 1870. He was baptized as Charles John Huffham, and occasionally subscribed that name. His father, John Dickens, was a clerk in the navy pay office, stationed at Portsmouth dockyard, and Charles was the second of eight children. When he was four years old his parents removed to Chatham, where his education began, and where at the age of nine he produced a tragedy called "Misnar, the Sultan of India," founded on one of the "Tales of the Genii," which, with "Don Quixote," "Gil Blas," "Robinson Crusoe," and the novels of Fielding and Smollett, he had found in the house and eagerly devoured. The next year his father became bankrupt and was imprisoned, and the family moved to Bayham street, one of the poorest quarters of London, whence Charles was sent to work in a blacking manufactory. But the father, having received a small legacy, retrieved himself somewhat, became a reporter for the "Morning Chronicle," and placed his son, after two years of schooling, in an attorney's office. The drudgery of this place was not agreeable to the boy, who continued to give all his spare time to the reading of novels, and visited the theatre whenever he could command the means. In the course of a year or two he determined to become a parliamentary reporter, and set himself diligently to the study of shorthand. In this capacity, at the age of 19, he was employed by the "True Sun," and at 23 by the "Morning Chronicle." In the "Old Monthly Magazine" for January, 1834, appeared his first published sketch, "Mrs. Joseph Porter over the Way." Similar sketches appeared in the succeeding numbers of the year, under the signature "Boz;" and they were then discontinued because their author demanded pay, which the publisher was indisposed to give. The signature "Boz" was a kind of mispronunciation of the name Moses, which was in the family given to a younger brother of Dickens, from a fancied resemblance to the Moses in Goldsmith's "Vicar of Wakefield." These sketches were continued for a year in the evening edition of the "Chronicle," and attracted considerable attention. Dickens received for them two guineas a week in addition to his regular salary of five guineas. In 1836 they were collected and published in two volumes, illustrated by Cruikshank. In April of this year he married Catharine, eldest daughter of George Hogarth, a writer for the "Chronicle;" and about the same time the first number of "The Posthumous Papers of the Pickwick Club" was announced. The firm of Chapman and Hall had proposed to Dickens a work of fiction in monthly numbers, of which he should furnish the letterpress, and Mr. Seymour, a comic artist of some celebrity, the illustrations. Seymour died by his own hand just before the second number appeared, and Hablot K. Browne (under the pseudonyme of

"Phiz") took his place. The first two or three numbers were not remarkably successful; but after that, especially when Sam Weller appeared in the fifth number, the work gained rapidly, until at its completion Dickens was the most popular writer in the language. "The Pickwick Papers" were published collectively in 1837. Meanwhile he had begun "Oliver Twist" in "Bentley's Miscellany," the first numbers of which were appearing simultaneously with the last of "Pickwick;" it was published in book form in 1838. In January of that year he assumed the editorship of "Bentley's Miscellany," but soon relinquished it. The "Memoirs of Joseph Grimaldi" appeared in 1838, with the name of Dickens as editor; but he really contributed nothing to the book but the preface. "Nicholas Nickleby" was published in monthly numbers from April, 1838, to October, 1839. In 1838 he published anonymously a small volume of sketches entitled "Young Gentlemen," and soon afterward another entitled "Young Couples." Under the general title of "Master Humphrey's Clock," "The Old Curiosity Shop" and "Barnaby Rudge" appeared in monthly numbers during 1840 and 1841, but subsequently were published as distinct stories. In the latter year he travelled in the highlands of Scotland, taking his work with him and writing at it regularly. On his return he wrote many political squibs, some of them in verse, directed against the Tories. In January, 1842, Dickens and his wife sailed for America, landing at Boston on the 22d. Of that visit neither Mr. Dickens nor the American people had reason to be proud. On their part he was received and fêted with an admiration which degenerated into snobbishness; and on his part the liberal but often ridiculous hospitality was repaid in the "American Notes" and "Martin Chuzzlewit" with sneers and caricature. He returned to England in June, and published "American Notes for General Circulation" toward the close of the year. In 1843 he wrote "The Christmas Carol," the first of a series of short stories for the holidays, in which benevolence, generosity, and kindly sympathy are inculcated. These stories have met with a popular appreciation not surpassed by his novels, and several of them have been dramatized. The titles and dates of the others are as follows: "The Chimes" (1844); "The Cricket on the Hearth" (1845); "The Battle of Life" (1846); "The Haunted Man and the Ghost's Bargain" (1848); "Dr. Marigold's Prescriptions" (1865), of which 250,000 copies were sold in England in one week; "Mugby Junction" (1866); and "No Thoroughfare" (1867). The last two were written in collaboration with others. "Martin Chuzzlewit" was published in 1844, and in July of that year Dickens went to Italy, where he resided about a year. On Jan. 1, 1846, he became editor of the "Daily News," a newly established morning journal of liberal politics, and in this his "Pictures from Italy" were first published. As a politi-

cal editor he was not successful, and at the end of four months his connection with the "News" was terminated. "Dealings with the Firm of Dombey and Son" was published serially in 1847-'8, and "David Copperfield" in 1849-'50. In 1850 Dickens started "Household Words," a weekly periodical, in which appeared his "Child's History of England" (1852) and "Hard Times" (1854). It is said to have attained a circulation of 90,000 in Great Britain. "Bleak House" appeared serially in 1852-'3, and "Little Dorrit" in 1856-'7. In 1858 Dickens and his wife arranged an amicable separation for reasons which have never been fully given to the public. In 1859, incidental to this separation, he had a disagreement with the publishers of "Household Words," which ended in his buying out their interest and suspending the publication. He then started "All the Year Round," a similar periodical, and in this appeared "A Tale of Two Cities" (1860), "Great Expectations" (1861), and "The Uncommercial Traveller." "Our Mutual Friend" was published in monthly numbers in 1864-'5. In this form also he commenced publishing in April, 1870, "The Mystery of Edwin Drood," which was uncompleted at the time of his death. Besides the works already enumerated, he produced a number of short stories, no complete collection of which has yet been made. Among them are "Chops the Dwarf," "The Holly Tree Inn," "Mrs. Lirriper's Lodgings," "Mrs. Lirriper's Legacy," and "A Child's Dream of a Star."—Dickens's works began a new era in fictitious literature. No predecessor had made so many studies from actual and ordinary life, from the scenes and characters nearest at hand, or had been so imaginative in their delineation; and no novels had appealed so powerfully to the universal sympathies and best impulses of mankind. They are full of faults in plot, in style, and in character, and there is scarcely one of them that could not be improved by cutting out extraneous matter; but their great excellences override everything, and captivate every reader who has the slightest interest in the common virtues and foibles, or sympathy with the common joys and sorrows of humanity. Most of them are written with a purpose, more or less obvious, beyond the mere production of a story. Thus "Oliver Twist" exposes the abuses of the poorhouse system and the training of boys to crime; "Nicholas Nickleby" was aimed at the horrors of cheap boarding schools; "Hard Times" delineates the sufferings of the manufacturing population, "Bleak House" the delays of the court of chancery; while "Our Mutual Friend" has for its theme the idea that prosperity only expands natural goodness and intensifies natural meanness. Almost all of them attack some notable form of vice, or social wrong, or abuse of power. None of them deal with the past, except "Barnaby Rudge" and "A Tale of Two Cities." They have all gone through numberless editions in

England and America; but they have not borne very well the test of translation, and are not so popular in foreign languages as in English, for the obvious reason that much of their charm depends on a kind of humor peculiar to the Anglo-Saxon race, and is often conveyed in idioms that are not translatable.—Dickens always had a love for the drama, and was a frequent performer in private theatricals. He wrote an opera and a few farces and light comedies, one of which was afterward transformed into his burlesque story of "The Lamplighter." In 1851 he organized, with other authors and artists, a company of amateur actors, under the name of "Guild of Literature and Art," intended for the special benefit of authors, artists, and actors; and considerable charitable funds were raised by their performances, notably that for the relief of the family of Douglas Jerrold. Having often given readings of his shorter stories for benevolent objects, in April, 1858, Dickens first appeared in London as a public reader for his own benefit; and from that time he read frequently in the chief cities of Great Britain and Ireland, giving a course also in Paris. In November, 1867, he visited the United States for the same purpose, and gave his first reading in Boston, Dec. 2, his last in New York, April 20, 1868. His tour comprised the chief cities of the eastern and middle states, but extended no further west than Buffalo. The success of these performances on both sides of the Atlantic was probably beyond his own expectations. Artistically they were almost perfect, for Dickens was an excellent actor, and gave long and hard study to the minutest details. Financially they were more profitable than all his publications had been. He gave his last reading in England on March 15, 1870.—Few literary men have ever maintained so large an interest as Dickens in whatever was going on around them; and scarcely one has so well exhibited his ability for taking care of his own business affairs. His share in the profits of his first two or three books was comparatively small; but thereafter he always dictated the terms to his publishers, and looked sharply after his own interests. It had been his dream when a boy to own Gadshill house, which he frequently passed by and admired; and in 1857 he purchased it and made it his home. His first visitor there was Hans Christian Andersen, and for 13 years it was the scene of a generous hospitality. Dickens had few of the hobbies and superstitions that are generally supposed to be inseparable from genius; one, however, is noticeable: having been out of London when the first number of "Pickwick" appeared, he invariably left town just before the publication of the initial numbers of his subsequent stories.—On June 8, 1870, as he sat down to dinner, it was observed that he appeared unwell, but he declared that he was only suffering from a toothache, and declined to have a physician called. At the same time he requested that

the window should be closed, and immediately sank into a stupor, from which he never rallied. With no returning gleam of consciousness, he died the next evening. The cause of his death was apoplexy, brought on by overwork. He left five sons and two daughters, and bequeathed to them the greater portion of his estate. He had refused a baronetcy offered him by the queen, and in his will he wrote: "I emphatically direct that I be buried in an inexpensive, unostentatious, and strictly private manner; that no public announcement be made of the time or place of my burial. . . . I direct that my name be inscribed in plain English letters on my tomb, without the addition of 'Mr.' or 'Esquire.' I conjure my friends on no account to make me the subject of any monument, memorial, or testimonial whatever. I rest my claims to the remembrance of my country upon my published works, and to the remembrance of my friends upon their experience of me. In addition thereto I commit my soul to the mercy of God, through our Lord and Saviour Jesus Christ, and I exhort my dear children humbly to try to guide themselves by the teachings of the New Testament in its broad spirit, and to put no faith in any man's narrow construction of its letter here or there." Dickens was buried privately in the poets' corner of Westminster abbey. He never furnished any materials for a biography; but it is supposed that "David Copperfield," which is very generally considered his best novel, is largely autobiographical in fact, as it is in form. John Forster, his intimate friend and one of his executors, has written his biography in three volumes (London, 1872-'4; reprinted in Philadelphia). See also "Life of Charles Dickens," by R. Shelton Mackenzie (Philadelphia, 1870); "The Dickens Dictionary," by Gilbert A. Pierce (Boston, 1872); and "The Cyclopædia of Dickens," by F. G. de Fontaine (New York, 1873).

DICKINS, John, an American clergyman, born in London, Aug. 24, 1747, died in Philadelphia, Sept. 27, 1798. He studied at Eton, emigrated to America before the revolution, and was one of the prominent founders of the Methodist Episcopal church in America, suggesting the name which was adopted. From 1776 to 1782 he preached in Virginia and North Carolina. As early as 1780 he suggested to Bishop Asbury the plan of Cokesbury college, at N. Abingdon, Md., the first Methodist academic institution in America. In 1783 he took charge of the John street church, New York, and was the first American preacher to receive Thomas Coke and approve his scheme for organizing the denomination. In 1789 he was stationed in Philadelphia, and there established the "Methodist Book Concern" (afterward removed to New York), commencing it with \$600 lent by himself to the church, and continuing in charge of it till his death.—His son, ASBURY DICKINS, born July 29, 1780, was in 1801 associated with Joseph Dennie in found-

ing the "Port Folio" at Philadelphia. He was first clerk in the United States treasury department from 1816 to 1833, and in the state department from 1833 to 1836, when he was elected secretary of the United States senate, which office he held till July 16, 1861. While in the treasury and state departments he was often acting secretary, and wrote many important state papers. He died in Washington, Oct. 23, 1861.

DICKINSON. I. A N. W. county of Iowa, bordering on Minnesota; area, 430 sq. m.; pop. in 1870, 1,389. It contains a number of small lakes, the principal of which is Spirit lake. The largest river is the Okoboji, an affluent of the Little Sioux. The chief productions in 1870 were 21,871 bushels of wheat, 20,541 of oats, 5,267 of Indian corn, and 3,267 tons of hay. The total value of live stock was \$81,470. Capital, Spirit Lake. **II.** A N. W. central county of Kansas, intersected by the Kansas river, and watered by its affluents; area, 846 sq. m.; pop. in 1870, 3,043. The surface is mostly prairie, but somewhat diversified. The soil is fertile. The Kansas Pacific railroad traverses it. The chief productions in 1870 were 55,312 bushels of wheat, 97,615 of Indian corn, 21,628 of oats, 10,349 of potatoes, 11,115 tons of hay, and 41,161 lbs. of butter. There were 1,153 horses, 1,494 milch cows, and 5,157 other cattle. Capital, Abilene.

DICKINSON, Anna Elizabeth, an American lecturer and author, born in Philadelphia, Oct. 28, 1842. She was the youngest of five children, whose father died when she was two years old, leaving his family in poverty. She received her early education in the free schools of the society of Friends, to which her parents belonged. At the age of 14 she made her first appearance in print, with an article on slavery in the "Liberator." At 17 she left school, and during the next two years taught at New Brighton and in Bucks co., Pa. Her first speech was made in a meeting of the association of Progressive Friends in Philadelphia, in January, 1860, the subject being "Woman's Rights and Wrongs;" and from this time she began to speak frequently in such assemblies, chiefly on temperance and slavery. Meanwhile she obtained employment in the United States mint at Philadelphia. But in November, 1861, in a speech alluding to the action at Ball's Bluff, she said, "This battle was lost, not through ignorance and incompetence, but through the treason of the commanding general;" for which she was dismissed from the mint. Thereupon she made lecturing her profession, speaking chiefly on political topics. Early in 1863 she accepted an invitation from the republican state committee of New Hampshire to enter the canvass for the March election. Afterward she accepted an invitation to make a similar tour in Connecticut; and in the autumn of the same year she was engaged by the republican committee of Pennsylvania to speak in the mining and agricultural dis-

tricts of that state. She opposed President Lincoln's candidacy in 1864, and advocated that of Greeley in 1872. For several years she has held a place among the regular lyceum lecturers, and has spoken in almost every part of the country. She has published a novel entitled "What Answer?" (Boston, 1868).

DICKINSON, Daniel Stevens. See p. 801.

DICKINSON, John, an American statesman, born in Maryland, Nov. 13, 1732, died in Wilmington, Delaware, Feb. 14, 1808. He studied law in Philadelphia, and subsequently at the Temple, London, and on returning to America practised with considerable success. Being elected to the Pennsylvania house of assembly in 1764, he evinced unusual capacities, and was a ready and energetic debater. At the same time he became known by his publications upon the attempts of the mother country to infringe the liberties of the colonies. In 1765 he was elected a deputy from Pennsylvania to the first colonial congress, and drafted the resolutions passed by that body. In 1768 he published his "Farmer's Letters to the Inhabitants of the British Colonies," which were republished in London with a preface by Benjamin Franklin, and subsequently in French in Paris. He was a member of the first continental congress in 1774, and of the state papers put forth by that body some of the most important, including the "Declaration to the Armies," the two petitions to the king, and the "Address to the States," were the production of his pen. He, however, opposed the adoption of the declaration of independence, believing that the movement was premature, and that compromise was still practicable, and was one of the few members of congress who did not sign it. So unpopular did he become with his constituents for his course on this occasion, that for several years he was absent from the public councils, although in the interim he signified his devotion to the American cause by serving as a private soldier in Delaware. In 1779 he returned to congress as a member from Delaware, and wrote the "Address to the States" of May 26. He was subsequently president of the states of Delaware and Pennsylvania successively, and a member of the federal convention for framing a constitution. In 1788 appeared his "Fabius" letters, advocating the adoption of the new constitution. Another series over the same signature, on the relations of the United States with France, published in 1797, was his last work. His political writings were published in 2 vols. in 1801.

DICKINSON COLLEGE, the name of a college of the Methodist Episcopal church, situated at Carlisle, Pa. It was founded in 1783 as a Presbyterian institution, and named after John Dickinson, president of Pennsylvania, in consideration of his valuable gifts for its establishment, and his great personal interest in it. It remained Presbyterian till 1833, when, in consequence of the embarrassments caused by the division of that church, it was transferred to

the Methodist Episcopal church. The Presbyterian presidents of the institution were Charles Nisbet (elected in 1784), Robert Davidson (1804), Jeremiah Atwater (1809), John M. Mason (1821), William Neill (1824), and Samuel M. How (1830); the Methodist presidents, John P. Durbin (1833), Robert Emory (1845), Jesse T. Peck (1848), Charles Collins (1852), Herman M. Johnson (1860), Robert L. Dashiell (1868), and James A. McCauley (1872). The list of graduates contains the names of President Buchanan, Chief Justice Taney, and Postmaster General Creswell. During the year of the centenary of American Methodism (1866) its endowment fund was increased to \$100,000. A scientific and a law department have recently been established; also a Biblical course for students preparing for the ministry. In 1873 there were 7 professors, 2 tutors, and 87 students. The college consists of three buildings; it has a valuable scientific apparatus and libraries containing about 30,000 volumes. In the junior and senior years divergences from the classical course are allowed, either in favor of the Hebrew language for those studying for the ministry, or in favor of the natural sciences. A complete catalogue, containing names of the presidents, professors, trustees, and graduates from the foundation, was issued in 1864.

DICKSON, a N. county of Tennessee, bounded N. E. by Cumberland river, and drained by several of its affluents; area, about 650 sq. m.; pop. in 1870, 9,340, of whom 1,677 were colored. It has a rolling surface and a tolerably fertile soil. The Cumberland river, along its border, is navigable by steamboats, and it is intersected by the Nashville and Northwestern railroad. The chief productions in 1870 were 36,130 bushels of wheat, 319,085 of Indian corn, 58,810 of oats, 98,798 lbs. of butter, and 462,130 of tobacco. There were 1,622 horses, 1,917 milch cows, 3,698 other cattle, 6,925 sheep, and 11,557 swine; 4 flour mills, 4 saw mills, and 2 manufactories of pig iron. Capital, Charlotte.

DICKSON, Samuel Henry, an American physician, born in Charleston, S. C., in September, 1798, died in Philadelphia, March 31, 1872. He graduated at Yale college in 1814, and afterward studied medicine in Charleston and at the university of Pennsylvania. He was instrumental in the establishment of a medical college in Charleston, and on its organization in 1824 became professor of the institutes and practice of medicine. In 1832 he retired, but in the following year, on the reorganization of the institution as the medical college of the state of South Carolina, he was reelected. In 1847 he was called to the professorship of the practice of medicine in the university of New York, which he filled till 1850, when he resumed his professorship in the medical college of South Carolina. In 1858 he became professor of the practice of medicine in the Jefferson medical college at Philadelphia. He contributed many papers to various medical jour-

nals, and published a work on "Dengue" (Philadelphia, 1826); "Manual of Pathology and Practice of Medicine;" "Essays on Pathology and Therapeutics" (2 vols. 8vo, New York, 1845); "Essays on Life, Sleep, Pain, &c." (12mo, Philadelphia, 1852); and "Elements of Medicine" (8vo, Philadelphia, 1855). He was also the author of a pamphlet on slavery, in which he asserted the essential inferiority of the negro race.

DICQUEMARE, Jacques François, a French naturalist and astronomer, born in Havre, March 7, 1733, died March 29, 1789. He was a priest, and became professor of experimental physics at Havre, and member of the academy of Rouen and of the royal marine academy. He invented several useful instruments in connection with astronomy and navigation, but is better known by his researches into the natural history of zoöphytes, infusoria, and mollusks, and particularly by his discoveries relative to sea anemones, on which he published an essay in French and English (4to, London, 1774). He designed an instrument called the cosmoplane, by means of which he solved problems in nautical astronomy. Besides numerous papers in the *Journal de Physique*, he published an *Index géographique* (1769), *Idée générale de l'astronomie* (1769), and *Connaissance de l'astronomie* (1771).

DICTATOR, the chief magistrate in the cities of the ancient Latin confederacy, in Alba, Tusculum, &c. The Romans adopted the word from their Latin neighbors, and applied it in the earliest period of the republic to exceptional magistrates appointed in times of danger, with nearly absolute power over life and property, from which there was no appeal to law or people. The dictator was usually nominated by the senate, and appointed by one of the consuls for six months, during which time the consuls and other regular magistrates continued in their office, though subject to his dictates, and deprived temporarily of their badges of dignity. The power of the dictator was mostly limited to one object, and particularly to foreign affairs. Being elected, he appointed his lieutenant or master of the horse (*magister equitum*) and surrounded himself with his 24 lictors (twice as many as attended the consuls), armed with fasces and axes. He was limited only in regard to the use of the public money, and responsible only after the expiration of his term; he was not allowed to leave Italy, or to appear on horseback within the precincts of the city. Officers bearing the same title were also sometimes appointed for certain civil or religious purposes. This office was quite harmless, but in later periods dictators were appointed *reipublicæ constituendæ causa* (to form a new constitution), such as Sulla and Cæsar, whose arbitrary power destroyed the republic. The first Roman dictator, Lartius, was appointed within ten years after the establishment of the republic (about 500 B. C.), to save the state from the threatening allies of Tarquin,

the expelled king, and the more dangerous disturbances within the walls. The public lands were in the grasp of the patricians, and the plebeians were poor and degraded. The danger from the supporters of Tarquin was imminent. The senate commanded new levies, but the people refused to obey, declaring that they had nothing to defend, and that no foreign yoke could bring upon them greater hardships than those they endured. In their disobedience they were protected by the law recently passed through the efforts of Valerius Poplicola, which permitted every citizen condemned to any severe punishment to appeal to the people. To evade the force of this popular law, the senate agreed upon the extraordinary measure of electing a single magistrate with more than regal power. The people confirmed the decree, and the success and honesty of Lartius proved worthy of the new dignity. About two years later another dictator, Aulus Posthumius, destroyed the last hopes of the banished king, in a battle fought near Lake Regillus. Not less remarkable were the services of the dictator L. Quintius Cincinnatus, who, having accomplished the object of his appointment by routing the Æqui and saving the surrounded consular army, resigned his dignity within 17 days. C. M. Rutilus (356) was the first plebeian appointed to the dictatorship, and M. J. Pera (216) was the last dictator in the original sense of the word; for the same dignity, as bestowed on Sulla (82), and three times on Cæsar (47, 45, and 44), meant only unlimited, despotic sway. Mark Antony abolished it altogether.

DICTIONARY (Lat. *dictio*, a word), in its ordinary acceptation, a book containing the words of a language, in alphabetical order, with a definition annexed to each. The title of dictionary is also sometimes given to alphabetically arranged cyclopædias; as dictionaries of law, of medicine, of the arts, of sciences, of commerce, &c. (See CYCLOPEDIA.) A complete dictionary would fulfil the same office with respect to language that a universal cyclopædia fulfils with respect to arts, sciences, and literature, giving an account of the origin and applications of the verbal symbols of ideas and facts, as the latter gives an account of the ideas and facts themselves. It would, therefore, state the etymology of words, and note their variations in meaning through the successive periods of a literature. A glossary is a dictionary of obsolete, provincial, or technical words; and the term lexicon, though hardly distinguished by usage from dictionary, is more frequently applied to vocabularies of the ancient and learned languages, with the definitions and explanations in some modern language. The earliest dictionary known is probably the series of clay tablets covered with cuneiform inscriptions which were found in the ruins of a palace of Nineveh, and which are ascribed to the time of the Assyrian king Asshur-bani-pal, whose seal is impressed on them. They are divided into

two, and occasionally into three and even four vertical columns, in which complicated ideographic or monographic signs are explained in the more simple and phonetic syllabary of the time. Dictionaries, though not approaching the modern arrangement so closely as do these Assyrian tablets, were also in use in very ancient times among the Chinese and Japanese. The Greeks and Romans appear not to have employed dictionaries in learning foreign languages, but uniformly to have availed themselves of conversation with foreigners. Nor have any early attempts at Greek lexicography been preserved. The oldest extant Greek dictionary is by Apollonius of Alexandria, a contemporary of Augustus, whose "Homerie Lexicon" (Λέξεις Ὅμηρικαί), though much interpolated, has been of value in modern times in interpreting the idioms of the Iliad and Odyssey. Erotianus, a Greek writer in the reign of Nero, made a glossary of all the learned words found in Hippocrates. Subsequent Greek dictionaries were the *Onomasticon* of Julius Pollux (about A. D. 177), containing explanations of the most important words relating to various prominent subjects, the arrangement being topical instead of alphabetical; the dictionary (Ἑκλογία) of Attic words and phrases, by Phrynichus, an Arabian or Bithynian, who lived under Marcus Aurelius; the dictionary of the words that occur in Plato, by Timæus the sophist, probably of the 3d century, which, though brief, contains the best explanations of terms that have come down from the ancient grammarians; a lost universal lexicon by Diogenianus of Heraclea, which is often quoted by Hesychius and Suidas; and which was abridged from an elaborate work by Pamphilus, also lost; the dictionary to the works of ten Attic orators, by Valerius Harporation, of unknown date, compiled from works now lost, and of the highest importance for its explanations of legal and political terms, and its accounts of persons and things mentioned in the Attic orations; the comprehensive Greek dictionary of Hesychius, an Alexandrian grammarian of the 4th century, which, though much disfigured and interpolated in its present form, is a vast accumulation of most heterogeneous materials, and has been a principal source of our knowledge of the Greek language and of many ancient customs; the lexicon (Λεξικὸν Συναγωγὴ) attributed to Photius, patriarch of Constantinople (died about 890); and the Greek lexicon ascribed to Suidas, of unknown date, first quoted in the 12th century, containing both common and proper names alphabetically arranged, and valuable for the literary history of antiquity, and for its citations from ancient authors, as well as for its explanation of words.—The first Roman lexicographer was M. Terentius Varro, the friend of Cicero; but his work, entitled *De Lingua Latina*, is rather a voluminous treatise on the etymology and peculiar uses of words than a dictionary; only fragments have been preserved.

The elaborate work of Verrius Flaccus, in the earlier part of the 1st century, entitled *De Significatu Verborum*, is lost; but it was the basis of a valuable compilation by Pompeius Festus, in the 3d or 4th century, entitled *De Significatione Verborum*, which was abridged by Paulus Diaconus in the 8th century. Only one imperfect copy of the work of Festus is preserved. The words are classified alphabetically according to the initial letter of each, but the order of the subsequent letters is not observed. The information which it contains has been of great importance on many obscure points connected with antiquities, mythology, and grammar. Near the middle of the 11th century Papias of Lombardy compiled a Latin dictionary from the glossaries of the 6th and 7th centuries. An indication of progressive learning in Italy in the 13th century was the *Catholicon* of Giovanni Balbi, a Genoese monk, consisting of a Latin grammar followed by a copious dictionary. The work is in Latin, forms a volume of great bulk, was written about 1286, and is now celebrated as a rare typographical curiosity, its first edition having been printed by Gutenberg in 1460. The *Cornucopia* of Perotti, bishop of Siponto, printed in 1489, was a copious commentary on Martial, followed by an alphabetical index of words, and was of much service to subsequent compilers. The first edition of Calepino's Latin dictionary appeared at Reggio in 1502. At first only a Latin lexicon, additions of the corresponding Italian, Greek, German, &c., words were successively made, till it was extended (Basel, 1590–1627) to eleven languages. The French gave the name *calepin* to any voluminous compilation. An epoch in Latin lexicography was made by the publication of Robert Stephens's *Thesaurus Lingue Latine* (1532; 3d enlarged ed., 1543), which attempted to exhibit the proper use of words, not only in all the anomalies of idiom, but in every minute variation of sense. The most noted of subsequent Latin dictionaries is the *Lexicon totius Latinitatis* of Facciolati and Forcellini (Padua, 1771; 3d ed., 1831), in which every word is accompanied by its Italian and its Greek correlative, and which illustrates every meaning by examples from the classical authors. An English edition, edited by James Bailey, was published in London in 1828. Sir Thomas Elyot was the author of the first Latin-English dictionary (London, 1538), beyond the mere vocabularies of school boys. He was a distinguished scholar, and a friend of Sir Thomas More; his work reached the third edition in 1545. The largest similar work that had preceded it was the *Orbis Vocabulorum*, printed by Wynkin de Worde in 1500 (5th ed., 1518), which by successive improvements became the popular Latin-English dictionary of Ainsworth (1736, and many subsequent editions, of which the latest is the London quarto edition edited by John Carey, LL. D.; abridgment by Thomas Morell, D. D., Philadelphia, 1863). The most eminent Latin lexicographers since Forcellini

are the German scholars Scheller, Freund, and Georges. The work of Forcellini was the basis of the Latin-English dictionary of F. P. Lev-erett (Boston, 1836); and that of Freund, of the Latin-English lexicon of E. A. Andrews (New York, 1856). Many smaller lexicons have also been prepared for educational purposes, but nearly all are entirely formed from the material of the larger works.—The first modern Greek-Latin dictionary was that of Giovanni Crastoni of Piacenza (Milan, 1480; printed also by Aldus, 1497), which was for many years the only lexicographic aid for the student of Greek. Robert Constantine published at Basel, in 1562, a thesaurus of the Greek language, in which he had the assistance of Gesner, Turnebus, Camerarius, and other learned contemporaries. It was superseded by the *Thesaurus Græce Linguae* of Henry Stephens (Paris, 1572), the result of 12 years' labor, which has hardly been surpassed in the comprehensive and copious interpretation of words. Its arrangement is not in the alphabetical order of words but of roots, the derivatives and compounds being collected after each root. It was the basis of the works of Scapula and Schrevelius. The most thorough subsequent Greek lexicons are the German works of Schneider, Passow, Seiler, Rost, and Pape. The work of Passow was the basis of the Greek-English lexicon of Liddell and Scott (Oxford, 1845; New York, edited by Henry Drisler, 1848; large 4to ed., London, 1870). The Greek language was long studied through the medium of the Latin, and no Greek-English lexicon was projected until the present century. The first of these that was announced was that of John Pickering (Boston, 1826, much enlarged in 1829, and subsequently in 1846), which was partially executed in 1814. It was preceded in publication only by the similar English work of John Jones (1823); that of Donnegan, an abridged translation from the German of Schneider, appeared in 1827.—The first standard dictionaries of modern languages were produced under the patronage of learned academies. The oldest was the Italian *Vocabulario della Crusca*, first published in 1612, which was avowedly founded on Tuscan principles, made the 14th century the Augustan period of the language, and slighted the great writers of the 16th; an enlarged edition of this work (Florence, 1729-'38) still forms the highest authority for the Italian language. In Spain the lexicon of Lebrixa (1492) and the *Tesoro* of Covarrubias (1611) were the only dictionaries of note till the new academy produced its great work (6 vols., Madrid, 1726-'39), an abridgment of which was immediately prepared (5th revised ed., 1817). Though German lexicography begins with Hrabanus Maurus, a contemporary of Charlemagne, the first noteworthy German lexicon was *Die Teutsche Sprach* of Maaler (Zürich, 1561), and the first learned and critical work of the kind was Frisch's *Deutsch-lateinisches Wörterbuch* (Berlin, 1741). All

others have been superseded successively by the work of Adelung (Leipsic, 1774-'81), and that of the brothers Grimm (Leipsic, begun in 1852.) The dictionary of the French academy was published in 1694, and adopted the alphabetical order in its 2d edition in 1718. The 6th edition was issued in 1835. A 7th edition, much improved, to be completed in 2 vols. 4to, is now (1874) in progress, and will probably be finished in 1876. M. Patin is the chief editor; MM. de Sacy, Sandeau, C. Doucet, and Mignet are associated with him. L. N. Bescherelle's excellent dictionary of the French language, in 2 vols. 4to, appeared in 1843-'6. The large and important dictionary of M. E. Littré (4 vols. 4to, 1863-'73) is remarkably full, and has taken its place among the highest authorities.—The object of the first lexicographical labors in England was to facilitate the study of the Latin language, and bilingual dictionaries had become common while those designed for merely English readers were rare and meagre productions. Probably the earliest of the latter was that of Dr. John Bullokar, entitled "The English Expositour" (London, 1616), explaining, as was announced on the title page, 5,080 of what were esteemed the "hardest words;" it passed through many editions. Subsequent works were the "Glossographia, or Dictionary of Hard Words," by Thomas Blount (London, 1656); the "New World of English Words," by Edward Phillips, the nephew and pupil of Milton (1658); and the "Universal Etymological English Dictionary," by Nathan Bailey (London, 1726), in which the first attempt was made to give a complete collection of the words of the language, and which was long in the highest repute. An interleaved copy of a folio edition of Bailey's dictionary was the repository of the articles collected by Dr. Johnson in preparing his dictionary. The work of Johnson, after eight years of arduous labor, appeared in 1755, and has exerted an influence superior to any other in fixing the external form of the language and settling the meaning of words. He first introduced into English lexicography the plan of illustrating the various significations of words by examples extracted from the best authors. It was much enlarged by Todd in the editions of 1814 and 1827, and has been the basis of many smaller works. The most important subsequent dictionaries are those of Smart, Richardson, Webster, and Worcester. Smart's dictionary, which Dr. Webster calls "most excellent," was published in 1836, at London. Richardson's "New Dictionary of the English Language" (2 vols. 4to, London, 1835-'7) is an elaborate work, especially valuable to the student of the history of the language. Its arrangement is in the alphabetical order of the primitives, beneath each of which its derivatives are grouped. Noah Webster was engaged 36 years on his "American Dictionary of the English Language," the first edition of which was

issued in 1828, in New York (2 vols. 4to), when the author was in his 70th year. A revised edition appeared in 1840 (2 vols. 8vo), with the addition of several thousand words which in the intervening 12 years had passed from technological science into common language; and a revised appendix was added in 1843. A new edition, revised and enlarged by Prof. C. A. Goodrich, was published in Springfield, Mass., in 1848 (1 vol. 4to, 1400 pages). In 1864 a still larger edition was published, with illustrations, after a revision of the work by Prof. Noah Porter of Yale college, who was aided by many able collaborators. For this edition much valuable matter has been added, such as a dictionary of noted names of fiction, names distinguished in modern biography, &c. Prof. James Hadley contributed to it a brief history of the English language, and an entire revision of the etymologies was made under the direction of Dr. C. A. F. Mahn of Berlin, Prussia. It forms a 4to volume of 1840 pages, containing about 114,000 words. Dr. J. E. Worcester's illustrated quarto dictionary, which had been preceded by two minor and preparatory works, was published in 1860, in Boston. This work, which contests with that of Webster the place of highest authority among American scholars, is the result of more than 30 years of labor, and contains about 104,000 words. The chief differences between it and Webster's dictionary are found in the spelling adopted for certain classes of words. Words like *centre*, *theatre*, &c., the last syllable of which is spelled by Worcester *tre*, and by Webster *ter*, are specimens of one of the most prominent of these classes. The participles and nouns formed from verbs ending in *el*, &c., form a still larger class; in these Worcester doubles the *l* (*traveller*, *travelling*, &c.), while Webster does not (*traveler*, *traveling*, &c.). Other differences exist, both in methods of spelling and in definition, and to some extent in pronunciation; but for the understanding of these a thorough study of the two works is necessary. (For other dictionaries, see the articles upon the different languages.)

DICTYS OF CRETE, the reputed author of a history of the Trojan war. The MS., written in Phœnician characters, but in the Greek language, is said to have been found in the author's tomb at Cnossus in the reign of Nero. A Latin version in six books has come down to us, but the work is commonly regarded as a forgery. Dictys is said to have followed Idomeneus, king of Crete, to the siege of Troy, and some ancient grammarians have imagined that Homer drew materials for the Iliad and Odyssey from his history. It was the chief basis of the mediæval literature relating to the siege of Troy, and was among the first books printed in the 15th century.

DIDEROT, Denis, a French writer and philosopher, born in Langres, Oct. 5, 1713, died in Paris, July 30, 1784. He was the son of a cutler, and was first educated for the church,

but soon gave up theology to enter an attorney's office in Paris. Law, however, did not occupy his time so much as literature and science. Failing to select a profession, he was deprived of his allowance by his father, and for a time obtained a livelihood by teaching. He married unfortunately, translated a history of Greece, wrote sermons, and furnished articles for a dictionary of medicine. In 1745 he wrote his *Essai sur le mérite et la vertu*, and in 1746 his *Pensées philosophiques*, the boldness of which was punished by a sentence of the parliament, and *Bijoux indiscrets*, a collection of obscene tales, of which he himself was ashamed. His *Lettres sur les aveugles à l'usage de ceux qui voient* (1749) procured him at once an acquaintance with Voltaire and three months' imprisonment at Vincennes, where he was often visited by Rousseau. On his liberation, in conjunction with D'Alembert, he framed the plan of the work upon which his reputation is mostly founded, the *Encyclopédie*. Its professed aim was to present in a single work the truths of science, the principles of taste, and the processes of all the arts; but it was in fact a vehicle for the diffusion of new ideas. He wrote nearly all the articles on ancient philosophy, and all those on the trades and industrial pursuits; and after the withdrawal of D'Alembert he had the supervision of the whole. Two volumes of the *Encyclopédie* appeared in 1751; but they were suppressed, and the printing of others was forbidden during 18 months, owing to its alleged hostility to Christianity. This suspension was revoked, and five new volumes had appeared in 1757, when it was again assailed with a tempest of denunciations, the result of which was a second suspension of the work. D'Alembert deserted his partner, and Voltaire subsequently advised Diderot to leave the country, and complete his work enjoying the hospitality of Catharine of Russia. He, however, struggled against all obstacles, and was finally permitted to continue the publication at Paris, without subjecting it to censorship; but on the title page Neufchâtel was to be printed instead of Paris, and the name of the editor was left blank. The ten additional volumes were thus produced with no further difficulty. While engaged on the *Encyclopédie*, Diderot wrote books of various kinds in his own name, and greatly contributed to those by his friends. Thus a large portion of Raynal's history of the Indies belongs to him, while the most eloquent pages of *De l'esprit*, by Helvétius, and of the *Système de la nature*, by D'Holbach, are attributed to his pen. The artistic part of Grimm's correspondence, known as *Les salons*, was written by him, and several letters on different subjects bear unmistakable marks of his hand. Diderot was always ready to help the needy, and his personal influence could scarcely be overrated. In 1757 and 1758 he produced two domestic dramas, *Le fils naturel* and *Le père de famille*, which paved the way

to the change afterward accomplished in the dramatic style in France. His industry brought him money, but his careless manner of spending it and his dissipated habits frequently involved him in pecuniary difficulties. In 1765 he was forced to offer his library for sale. Catharine II. of Russia purchased it for 15,000 francs, but on condition that he would be the keeper of it at a salary of 1,000 francs a year; she moreover ordered 50 years' income to be paid at once. When the *Encyclopédie* was completed, Diderot paid a visit to his protectress, and spent several months at her court, where he was treated with great respect. On his return to Paris he published two novels, *Jacques le fataliste* and *La religieuse*, and in 1779 his *Essai sur les règnes de Claude et de Néron*, which is merely an encomium of Seneca. His later years were passed in comparative quiet and comfort. He had been all his life considered an atheist, but during his last year he was frequently visited by the curate of St. Sulpice, with whom he was pleased to talk on religious subjects; and if he did not consent to any recantation of his philosophical opinions, he showed no particular enmity to Christianity. He left an only daughter, Mme. de Vandeul, who wrote *Mémoires* of his life. His friend Naigeon published an edition of his works in 15 vols. 8vo, 1798; but a more complete one, in 22 vols., appeared in 1822. To this must be added his *Mémoires et œuvres inédites*, 4 vols. 8vo, printed in 1830.—See *Diderot's Leben und Werke*, by Rosenkranz (Leipsic, 1866).

DIDIUS SALVIUS JULIANUS, Marcus, Roman emperor for a short time under the name of Marcus Didius Commodus Severus Julianus, born about A. D. 133, killed June 1, 193. Having filled successively the offices of quaestor, aedile, and praetor, he was appointed to the command of a legion in Germany, and afterward to the government of Belgic Gaul. Here he showed much energy in repressing an insurrection of the Chauci, and for this service he was made consul. He also distinguished himself against the Catti, was governor of Dalmatia and afterward of Lower Germany, and then took charge of the commissariat in Italy. After this he was governor of Bithynia in Asia Minor, was again consul in 179, and having filled the office of proconsul of Africa, returned to Rome, where he was made commander of the city guards. After the assassination of Pertinax, the praetorian guards offered the imperial throne to him who would pay the highest price; and after a brisk bidding against Sulpicianus, prefect of the city, Didius obtained it. The senate was obedient to the will of the unruly soldiery, and Didius was acknowledged emperor. But whenever he appeared in public he was received with cries of "Robber and parricide." Moreover, he was not recognized as emperor by Septimius Severus, who held command of three legions in Illyria, by Clodius Albinus, nor by Pescennius Niger, who held like commands in Britain and Syria respective-

ly. Severus, having been proclaimed emperor by his troops, marched upon Rome, and was recognized by the senate. Deserted by his adherents, Didius was murdered in his palace by a common soldier, having reigned a little more than two months, and Septimius Severus established himself in his place.

DIDO, or *Elissa*, a legendary Phœnician princess and founder of Carthage, daughter of Mutgo, Belus, or Agenor, king of Tyre. According to Justin, she was the wife of her uncle Acerbas (the Sicheus of Virgil), priest of Hercules, who was murdered for his wealth by Pygmalion, the son and successor of Mutgo. Dido dissembled her sorrow, and with a number of disaffected Tyrian nobles escaped from her native country, bearing the treasures of her murdered husband. The party first landed at the island of Cyprus, whence they carried off by force 80 maidens, and then pursuing their journey debarked on the coast of Africa, purchased as much land as might be covered with the hide of a bull, and by cutting the hide into thin strips enclosed a large tract of country, on which the city of Carthage soon began to rise. (See *CARTHAGE*.) Their prosperity excited the jealousy of a neighboring chief, Iarbas, who demanded the hand of Dido in marriage, and threatened war in case of refusal. The queen asked three months for consideration, at the end of which time she mounted upon a funeral pile and plunged a sword into her breast. Virgil represents her as killing herself on being abandoned by Aeneas.

DIDOT, the name of a French family of printers. The firm, now existing under the name of Firmin Didot frères, was established in 1713 by François Didot, who made himself known by several important publications, and gained such popularity as to be appointed syndic of the booksellers' corporation. His two sons, François Ambroise (1730-1804) and Pierre François (1732-1795), increased the business, and paid especial attention to the printing department. While the latter established paper mills at Essonne, near Paris, the former materially improved the casting of types, the best specimens of which ever seen in France were from his foundry; and his standard editions were admired for their correctness and beauty. The *Collection d'Artois* (64 vols. 18mo), and the *Collection des classiques français*, printed at once in 4to, 8vo, and 18mo, by order of Louis XVI., are still highly valued. Among the sons of Pierre, HENRI, a type founder, is known for the microscopical types with which he printed some little volumes which are esteemed as gems of their kind; and SAINT-LÉGER engaged in the manufacture of paper. The sons of François Ambroise, PIERRE (1760-1853) and FIRMIN (1764-1836), who succeeded their father at the beginning of the revolution, added to the good name of the firm by publishing magnificent folio editions of classic French and Latin writers, known as *éditions du Louvre*. Firmin also aimed to furnish the general reader

with cheap and correct editions. He invented, or more correctly revived the stereotype process, which he brought at once to comparative perfection. He translated Virgil's "Bucolics" and Theocritus's "Idyls." He was elected in 1827 to the chamber of deputies. He was succeeded in the management of the firm by his sons AMBROISE FIRMIN (1790-1876) and HYACINTHE (born 1794), and they by their sons ALFRED (born 1828) and PAUL (born 1826). Ambroise Firmin was the author of several works. Among their notable publications are: *Monuments de l'Égypte et de la Nubie*, by Champollion the younger; *Voyage de Jacques-mont dans l'Inde*; *Expédition scientifique des Français en Morée*; the *Thesaurus Lingue Græcæ* of Henry Stephens, with annotations and additions by the best French and German scholars; a complete *Bibliothèque des auteurs grecs*, a very cheap and correct edition of the Greek writers, with copious notes and Latin translations. Their editions of the French classics are numerous and valuable; and their extensive popular publications, such as *L'Univers pittoresque*, *L'Encyclopédie moderne*, and *La nouvelle biographie générale* (completed in 1866), are remarkable for cheapness and accuracy.

DIDRON, Adolphe Napoléon, a French archaeologist, born in Hautevillers, department of Marne, March 13, 1806, died in Paris, Nov. 13, 1867. He travelled on foot through Normandy, examining all the remarkable mediæval monuments. In 1835 he was appointed by Guizot secretary of the historical committee of arts and monuments, and wrote the four volumes of elaborate reports issued by that committee. In 1838 he delivered in the royal library a course of lectures on Christian iconography, after which he made a journey to Greece to compare the art of the Greek church with that of the West, and to obtain access to mediæval manuscripts. On his return to Paris in 1840 he delivered another course of lectures, and in 1845 founded there an archaeological publishing house, and a manufactory of painted glass. He established in 1844, and edited until 1866, the *Annales archéologiques*, devoted particularly to the archæology of the middle ages, in preparing which he was assisted by the principal archaeologists, architects, designers, and engravers of Europe. His most important publication is the *Manuel d'iconographie chrétienne grecque et latine* (1845), of which an English translation was published in 1851.

DIDYMIUM (Gr. *δίδυμος*, twin), a metal discovered in 1841 by Mosander in the mineral cerite, and named for its resemblance to the metal lanthanum, which occurs in the same mineral, and for the persistence with which its salts remain combined with those of this metal. The rose color of the salts of lanthanum is probably due to the presence of didymium. But neither of the two metals, nor the cerium with which they occur, possesses any special interest, and the complete quantitative separation of the metals is even yet attended with great difficulty.

DIDYMUS, an Alexandrian grammarian and critic, born about 64 B. C. He was noted for his industry and the copiousness of his writings, in consequence of which he received the nicknames of *Χαλκέντερος*, or brazen-bowelled, and *Βιβλιολάθας*, or forgetter of books. The number of his works is stated by Athenæus at 3,500, and by Seneca at 4,000.

DIEBITSCH, Hans Karl Friedrich Anton, a Russian general, born in Silesia, May 13, 1785, died near Pultusk, Poland, June 10, 1831. His father, a Prussian and afterward a Russian officer, sent him in 1797 to the house of cadets in Berlin, but made him enter the ranks of the Russian imperial guard in 1801. He fought in the battles of Austerlitz, Eylau, and Friedland, was made captain, and devoted himself to the study of military science during the five years of peace which followed the treaty of Tilsit. He served under Wittgenstein during the invasion of the French in 1812, and persuaded the Prussian general York to capitulate. As chief of Wittgenstein's staff in 1813 he distinguished himself at Lützen, and was then attached as quartermaster general to the corps of Barclay de Tolly in Silesia. At Leipsic he was made by the emperor Alexander lieutenant general on the battle field. In the campaign of 1814, when Schwarzenberg advised the retreat of the allied armies, Diebitsch decided for the march on Paris, which terminated the war. In 1815 he married a niece of Barclay de Tolly. Being made chief of the staff of the army, he accompanied Alexander through the south of Russia, and was present at his death at Taganrog in 1825. At St. Petersburg he distinguished himself during the outbreak of Dec. 25 by intrepidity, prudence, and humanity. The new emperor, Nicholas, rewarded his services with the title of baron, and afterward with that of count. In the war of 1828-'9 against Turkey he took Varna, and by marching across the Balkan forced the Porte to make the peace of Adrianople, and received the name of Zabalkanskoi (Transbalkanian, that is, crosser of the Balkan). On the outbreak of the revolution in Warsaw, Nov. 29, 1830, he was appointed commander-in-chief of the army and governor of the provinces adjoining Poland. He crossed the Polish frontier Jan. 25, 1831, but the engagements at Wisniew and Stoczek, Feb. 11, at Dobro on the 18th, at Grochów and Wawer on the 19th, and still more the battles fought about the end of March in the vicinity of Praga, proved that fortune had left his banners. Without profiting by the favorable issue of the battles of Nur, Lomza, and Ostrolenka (May 15-26), he removed his camp to Kleczewo, where he suddenly died of cholera.

DIEDENHOFEN (Fr. *Thionville*), a fortified town of Germany, in Lorraine, situated on the Moselle, and on the railway from Metz to Luxemburg, about 15 m. N. of Metz; pop. in 1871, 7,155. It has a gymnasium, a botanic garden, and manufactories of hosiery, woollen

cloths, candles, leather, liqueurs, and spirits. The Carolingian kings of France frequently resided here; subsequently the town belonged in succession to the counts of Luxemburg, to Burgundy, Austria, and Spain. In 1643, when it surrendered to the prince of Condé, it was annexed to France. In 1870 it suffered considerably from bombardment by the German troops, to whom the French garrison, consisting of 120 officers and 4,000 men, surrendered on Nov. 24. By the peace of May 10, 1871, it was ceded to Germany. The town is well built, and the fortifications constitute a fortress of the third class.

DIEFENBACH, Lorenz, a German philologist and author, born at Ostheim, Hesse-Darmstadt, July 29, 1806. He was educated at the university of Giessen, and became a clergyman, and in 1845 one of the founders of the German Catholic church in Offenbach, which city he represented in 1848 in the parliament at Frankfurt, and where in 1865 he was appointed second director of the library. He was a voluminous author, and published poems, novels, and various productions in light literature, as well as learned treatises. His principal works are: *Celtica* (3 vols., Stuttgart, 1839-'42); *Vergleichendes Wörterbuch der gothischen Sprache* (2 vols., Frankfurt, 1846-'51); *Pragmatische deutsche Sprachlehre* (Stuttgart, 1847; 2d ed., 1854); *Glossarium Latino-Germanicum Mediæ et Infimæ Ætatis* (Frankfort, 1857; 2d ed., 1867); and *Origines Europææ* (1861). The *Glossarium* is a supplement to Du Cange's.

DIEFFENBACH, Johann Friedrich, a German surgeon, born in Königsberg, Feb. 1, 1792, died in Berlin, Nov. 11, 1847. He was the son of a professor of theology, and at first devoted himself to that study, but joined in the war against Napoleon, serving as a volunteer

in a company of Mecklenburg troops from 1813 to 1815. He afterward resumed his theological studies, which he exchanged for the pursuit of medicine. Having taken his medical degree at Würzburg in 1822, he established himself at Berlin, where in 1830 he was appointed head surgeon of one of the hospitals, two years after professor in the university, and in 1840 director of clinical surgery. He was distinguished for his dexterity in the use of the scalpel, for the success of his operations in the formation of artificial noses, cheeks, lips, &c., and for the cures which he effected in cases of squinting and stammering. He also made great improvements in surgical instruments. Among his works are: "Operative Surgery," which has been translated into several different languages; "Surgical Experiences, especially with regard to the Restoration of Portions of the Human Body which have been destroyed;" "The Cure of Stammering by a new Surgical Operation;" and "On the Cutting of the Sinews and Muscles."

DIEPPE, a seaport town of France, department of Seine-Inférieure (Normandy), on the English channel, at the mouth of the Arques, 52 m. E. N. E. of Havre, and 93 m. N. N. W. of Paris; pop. in 1866, 19,946. It extends a mile along the coast, has wide and regular streets, and its houses, mostly of one style, are of brick, two stories high, with balconies toward the street. The finest hotels and residences are near the harbor, on the main street, which runs parallel with the sea the whole length of the town. The most remarkable public edifices are the churches of St. Remi and St. Jacques. The latter, a large Gothic structure, commenced in the 13th century, and not completed till the 15th, is built entirely of stone brought from England. The former

Castle of Dieppe.

is in the mixed Gothic-Saracenic style. There is a commercial court, a chamber of commerce, and a school of navigation. Dieppe is well supplied with water by an aqueduct 3 m. long, cut in the solid rock, and has 68 public and numerous private fountains. The port, enclosed by two jetties, is spacious and secure, with a basin of sufficient depth for vessels of 1,200 tons, but the entrance is difficult. It has two suburbs, La Barre and Le Pollet, and is protected by an old castle and by some batteries. Its manufactories of ivory are famous; and there are also sugar refineries, rope walks, paper mills, and ship yards. The manufacture of tobacco employs 1,200 hands. Fishing, however, occupies the attention of the greater portion of the inhabitants; from two oyster beds near the town about 12,000,000 oysters are annually sent to Paris. Dieppe is connected with Rouen, Paris, and Havre by rail, and by steamer with Newhaven, near Brighton, England. Its sea baths, with its pure air and picturesque situation, have made it the chief watering place of France. The principal bathing establishment combines reception rooms, ball, concert, and billiard rooms, and literary, social, and convivial saloons. In the early part of this century it became, under the patronage of the duchess de Berry, the rendezvous during the summer of the noblest families of France. Dieppe was founded in the 10th century, and in less than four centuries it had become the rival of Rouen. It was bombarded by the English and Dutch in 1694. It was the first maritime town of France occupied by the Germans in the war of 1870.

DIESKAU, Ludwig August, a German soldier in the French service, born in Saxony in 1701, died near Paris, Sept. 8, 1767. He was adjutant of Marshal Saxe, in whose interest he visited St. Petersburg in 1741. He accompanied him in the campaigns against the Netherlands, and became in 1748 brigadier general of infantry, and commander of Brest. In 1755 he was sent to Canada, at the head of French troops, to assist in the campaign against the English. With 600 Indians, as many Canadians, and 200 regular troops, he ascended Lake Champlain with the design of attacking Fort Edward. On Sept. 8 he defeated a detachment under Col. Williams, which had been sent against him, and pursued them to the British camp. The savages, however, halted just without the intrenchments, the Canadians became alarmed, and the regulars perished before the fire of New England marksmen. Dieskau, thrice wounded, refused to retire from the field, and seated himself on the stump of a tree, exposed to the shower of bullets. He was severely wounded by a random shot, and was kept a prisoner till 1763, when he returned to France, receiving a pension.

DIESTERWEG, Friedrich Adolf Wilhelm, a German teacher and writer on education, born at Siegen, Oct. 29, 1790, died in Berlin, July 7, 1866. He studied at the academy of Herborn

and the university of Tübingen, and subsequently taught in various normal and Latin schools till 1832, when he was appointed director of the seminary for teachers of city schools in Berlin. He retired in 1850. He is the author of numerous text books on mathematics and geography, and of several manuals for teachers, which have passed through many editions. He advocated the theories of Rousseau, Pestalozzi, and modern liberalism in general, and was constantly engaged in polemics on school reform, which he published in his *Pädagogisches Jahrbuch* (Berlin, 1851-'65), and other periodicals. His biography has been written by Langenberg (3 vols., Berlin, 1867-'8).

DIEST, a town and fortress of Belgium, in the province of South Brabant, situated on the Demer, and on the railway from Antwerp to Liège, 32 m. N. E. of Brussels; pop. in 1866, 7,561. It has a college, several breweries, and flourishing manufactories of hosiery and woollens. Its only remarkable building is the church of St. Sulpicius. Its beer is celebrated, and large quantities are exported. Marlborough captured the town in 1705, but in the same year the French retook it and dismantled the fortifications.

DIET (Fr. *diète*), a term applied to several political bodies of mediæval and modern Europe, corresponding to the parliament in Great Britain, the cortes in Spain and Portugal, the states general, national assembly, and chambers in the history of France, and the congress in the United States. The derivation of the term from the Latin *dies*, day, as meaning a day fixed for the national deliberations on public affairs, is proved by the corresponding words in German (*Reichstag*), Dutch (*Rijksdag*), Swedish (*Riksdag*), and Danish (*Rigsdag*), all of which mean day of the empire; and by the similar Swiss term for the Helvetic diet (*Tagsatzung*). It is used by English and French historians of the state assemblies of the German empire and confederation, Poland, Hungary, Sweden, Switzerland, and some other countries, to which the Germans apply the distinctive appellations of *Reichstag*, *Landtag*, *Landstände*, *Bundestag*, *Tagsatzung*, &c. The diet of the German empire, which must not be confounded with the popular assemblies of the Germanic nations in the Carolingian times, or with the assembly (*Bundestag*) of the German confederation as established by the congress of Vienna, had its rise after the dissolution of the Frankish empire, and was slowly developed under the successive German houses, undergoing material changes, particularly in the reigns of the emperor Charles IV. in the 14th century, Frederick III. in the 15th, and Charles V. in the 16th, until it received its ultimate modifications by the treaty of Westphalia in 1648, and the session of Ratisbon in 1663. From this date down to the dissolution of the empire in 1806, Ratisbon became its permanent seat, while in previous times the emperor had the privilege of choosing the place of its ses-

sions. The emperor, who formerly appeared in person, was now represented by a principal commissary, and all members of the empire by plenipotentiaries or agents. The diet consisted of three divisions, the so-called colleges of electors, princes, and imperial cities. The elector of Mentz, the archchancellor of the empire, presided in the electoral college, the archbishop of Salzburg and the archduke of Austria alternately in the college of princes, and the city where the session was held in that of the cities. The electors and cities had individual votes, as well as the chief members of the college of princes, while the imperial counts and imperial prelates, who belonged to the latter, had only collective votes by benches, of which there were four of counts and two of prelates. Resolutions were passed by majority, except in religious matters and those concerning individual members of the empire alone. But the concurrence of all the three colleges and the ratification of the emperor were required to establish a decree of the empire (*Reichsschluss*). Concurrence in case of difference of opinion was obtained by reconsideration and conference. The emperor had the right of rejection of the whole or a part of the bill, but not of modification. The collection of resolutions passed and sanctioned by a diet was termed imperial recess (*Reichsabschied*). The diet framed the laws of the empire, abolished and explained them, declared war and made peace, received and sent envoys, and concluded treaties. Imperial wars were proposed by the emperor, decided upon by majority, and carried on by the contingents of both the majority and the minority. The administration of the German confederation (*Bund*), which lasted, with some modifications, from 1815 to 1866, was vested in a diet (*Bundestag* or *Bundesversammlung*), the members of which were appointed by the various governments, Austria being the leading power, though the leadership came to be disputed by Prussia. (See GERMANY.)—The Polish diet (*sejm*) dates principally from the reign of Ladislas the Short, who in 1331 assembled all the nobles of his kingdom. Its form was established by law under Casimir IV. In the last period of independent Poland it was convened regularly every two years, for a session of no more than six weeks, twice successively in Warsaw and the third time at Grodno, in Lithuania. It consisted of a senate and a chamber of deputies (*poset*, plur. *postowie*). The latter were elected in previous municipal or district assemblies (*sejmik*, little diet). After the verification of their powers, the diet elected their president or marshal (*marszałek*). The initiation of measures was a royal prerogative, the sovereign furnishing a list of subjects to be discussed during the session. In case of urgency the king could convoke an extraordinary diet to remain in session only two weeks. The most remarkable feature of the Polish diet was the so-called *liberum veto*, or the right of each

member to prevent the enactment of a law or measure by individual opposition (*nie pozwalam*, I do not allow, or *veto*). This extreme of liberty, unknown in the history of any other nation, was remedied in part by confederations formed by the majority for the execution of its designs, and by timely application of violence, which silenced treacherous or bribed opponents; but it also led to fatal distractions, scenes of bloodshed, the permanence of factions, and ultimately, with other causes, to the fall of Poland. The diet of election was preceded by a diet of convocation, the archbishop of Gnesen, the primate of the state, having announced the vacancy of the throne. Hereupon all nobles appeared personally, assembling on the plain of Wola, near Warsaw, the senate in a shed (*szopa*), the common nobles in the *kolo* (circle). A diet of coronation, and, if that of election had been stormy, another of pacification, followed.—The diet of Hungary (*diéta*, or *országgyűlés*), formerly convened at various places, was from the time of the Turkish invasion held at Presburg. It consisted of two houses, the upper, or table of magnates, and the lower, or table of deputies. In the latter, previous to the law of 1848, only the representatives of the nobles in the counties had a decisive personal vote. During the revolutionary period of 1848-'9 the diet was held successively at Pesth, Debreczin, and Szegedin. Since 1861 it has its seat in Pesth. (See HUNGARY.)

DIETERICI. I. Karl Friedrich Wilhelm, a German statistician, born in Berlin, Aug. 23, 1790, died there, July 29, 1859. He began his university studies in Königsberg, devoting particular attention to mathematics, and continued them in Berlin, where in 1812 he became tutor in the family of Klewitz, afterward minister of state. As engineer in the army of Blücher, he made the campaigns of 1813, 1814, and 1815; and in 1820 he was employed in the ministry of public instruction under Altenstein. In 1834 he was appointed professor of political science in the university of Berlin, and in 1844 succeeded Hoffmann in the direction of the statistical bureau. His writings relate mainly to subjects of political economy. The most important are, *Übersicht der wichtigsten Gegenstände des Verkehrs und Verbrauchs im preussischen Staate und im deutschen Zollverbande* (1838-'53), and *Der Volkswohlstand im preussischen Staate*. He left unfinished an important work, *Handbuch der Statistik des preussischen Staats*, which was completed by his son Karl in 1861. **II.** Friedrich, a German orientalist, son of the preceding, born in Berlin, July 6, 1821. He studied theology at Halle and Berlin, and oriental languages at Leipsic, and afterward in the East. In 1850 he became professor of Arabic literature in the university of Berlin, having been for some time dragoman of the Prussian embassy at Constantinople. He has published *Reisebilder aus dem Morgenlande* (1853), a translation of

the Arabic grammar entitled *Alfiyah* (1854), *Die propädeutischen Studien der Araber* (1851), *Chrestomathie ottomane* (1865), and other works.

DIETETICS. For his complete nutrition man must have in his food the albuminoid materials of which his tissues are mainly composed, the iron and the salts contained in those tissues and in the blood, and fatty matter, or some substance which can readily be converted into fat, which enters into the composition of his body, and which serves to maintain the animal heat. (See ABSTINENCE, ALIMENT, ANIMAL HEAT, and DIGESTION.) But food must not only contain all the principles necessary to nutrition, it must likewise be digestible and assimilable; it must be capable of being disintegrated and dissolved in the alimentary canal, so that it may be absorbed, and finally converted into blood from which the waste of the tissues may be supplied. An article may be highly nutritious, yet exceedingly indigestible; or it may be easily digestible, and afford little nutriment. While certain articles and classes of articles are in general more digestible, there is no rule of invariable application. There are differences in kind as well as in degree in the digestive powers of different individuals; and what will offend the stomach of one man, another will digest with ease. But aside from individual peculiarities, there are more general causes of difference. 1. Habit has great influence. What men have been accustomed to, they digest with greater facility. An American or Englishman visiting the continent of Europe is frequently attacked with diarrhœa, from an unaccustomed diet, which is in itself equally wholesome with his own. During the revolutionary war numbers of the troops from the southern states while on duty at the north became ill, and their health was only restored by an allowance of fat bacon. The ill-fed Irishman, on enlisting into the British army, frequently is affected with what is termed a "meat fever;" his new diet is so much superior to what he was accustomed to, that his organs do not readily adapt themselves to the change. 2. Circumstances have a great influence on the digestibility of food. A diet suited to Labrador would be oppressive and injurious in the West Indies. The season, amount of clothing, exposure, and exercise have an influence on the digestive capacity as well as on the requirements of the system. 3. The digestibility of food is much influenced by our liking for it; within certain limits, what we are fond of agrees with us, and what we dislike is not apt to digest well. The high flavor which excites the appetite of the epicure provokes nausea in a less cultivated stomach. Still, despite the various sources of diversity, some articles are for the majority of men of comparatively easy digestion, while others are assimilated with greater difficulty.—Food is commonly classed as animal or vegetable. Animal food may be

subdivided into the flesh of mammals, birds, fishes, reptiles, crustaceans, and mollusks. The flesh of the mammals, and indeed of the birds and fishes used for food, differs very little in chemical composition. The fibrine, albumen, and gelatine of which chiefly they are made up, may be considered as chemically identical, from whatever animal they may be derived. The fats differ in the relative proportions, and sometimes in the character, of the fatty acids which enter into their composition; the saline matters, varying in their proportions, are mainly of the same character; while the immense variety of flavors by which they are distinguished depend upon principles existing in exceedingly minute proportions, and for the most part soluble in water. The difference in meats arises from the varying proportions of fibrine, gelatine, and fat, and from variations in mechanical texture; and to these circumstances is due their difference in digestibility. Whatever renders the animal fibre harder, makes the meat less digestible; whatever renders it more delicate and tender, more easily separated and disintegrated, makes it more easily soluble in the juices of the stomach. Provided an animal has reached maturity, the tenderness of its meat is increased by youth, by its not having been worked, by its being in good condition, the muscular fibres interpenetrated and separated by minute proportions of fatty tissue. Keeping tends very much to improve the tenderness of meat. Few animals are fit to be eaten the day they are killed; but when kept, long before the slightest taint can be detected, a change takes place that renders the fibres more easily separated and disintegrated, more readily broken down and comminuted during mastication, and more quickly reduced and assimilated by the stomach. Of the different meats, venison that has been well kept is, in its season, perhaps the most tender and digestible. Dr. Beaumont found that in St. Martin a meal of broiled venison steak was completely digested and removed from the stomach in an hour and a half, a shorter time than was required by any other meat. Wether mutton of a proper age, that has hung for a sufficient length of time, is scarcely inferior in digestibility to venison. Beef ranks next to mutton. Lamb and veal are less digestible than mutton or beef, and veal is less readily digested than lamb. Of all the meats in ordinary use, pork is most refractory to the gastric juices; and, contrary to what holds with regard to beef and mutton, the sucking pig is more digestible than pork. The fat of meats generally, and all varieties of fatty matters, are difficult of assimilation; they are particularly offensive to weak stomachs, sometimes appearing to form an oily pellicle, which, floating on the partially chymified mass, becomes rancid and occasions distressing heartburn and nausea, or causes eructations of acrid matter which leave a peculiarly disagreeable taste upon the palate. The mode of dressing

meat has a great influence upon its digestibility; that which agrees best with the majority of stomachs is broiling. The fire should be brisk, so that the albumen on the surface of the meat may be rapidly coagulated; this preserves the juices, and it is rendered at once more savory and more tender. The same rule applies to boiling and roasting. When the meat is to be cooked, if boiled, it should be at once plunged into boiling water; while if soup is to be made, the meat should be put into cold water and the temperature slowly raised, thus extracting its nutritious fluids to the greatest possible extent. Of all methods of cooking, frying is the most objectionable; not only is the meat rendered harder than when boiled, and thus more indigestible, but it becomes imbued with boiling fat, and is thus rendered still more refractory to the gastric juice. Rich stews are objectionable on the same account. By the action of salt on muscular flesh, the juices of the meat are abstracted; in this manner not only is its nutritive value impaired, but it is rendered harder and drier and consequently more indigestible; the longer the flesh is exposed to the action of salt, the harder and drier it becomes. Perhaps all fats form an exception to the fact that meat is rendered more indigestible by salting; they have little water to lose, and their texture consequently cannot become consolidated; fat pork is even rendered more digestible by salting. St. Martin, according to Dr. Beaumont's observations, digested recently salted pork when raw or broiled in from 3 to 3½ hours; the same article fried occupied him 4½ hours for its reduction; while fresh pork, fat and lean, roasted, required 5½ hours. On the other hand, boiled fresh beef with a little salt was digested in 2¾ hours, while old salted beef required 4½ hours when dressed in the same manner. All empyreumatic substances impair digestion by interfering with the action of the pepsin, which is the principal solvent agent of the gastric juice. In this manner smoking impairs the digestibility of meat; few things are more difficult of management by a feeble stomach than old and well smoked beef. St. Martin found fowls, roasted or boiled, of slower digestion than beef; ducks and geese, as might be supposed from the amount of fat they contain, are assimilated with difficulty. There is, however, so much variation in this respect in different individuals, that the absolute digestibility of an article of food can hardly be deduced from experiments on a single person. Fish furnishes an abundant and digestible variety of food. The dry, white sorts, cod, haddock, bass, &c., are the most digestible; while the richer kinds, salmon, shad, mackerel, eels, &c., are less apt to agree with the stomach. St. Martin digested boiled or fried salmon trout in 1½ hour, boiled dried cod in 2 hours, fried catfish in 3 hours 20 minutes, and boiled pickled salmon in 4 hours. Milk, the only food during the earlier months of infancy, con-

tains from 12 to 13 per cent. of solid matter, about one half of what is contained in flesh; it is poorer in nitrogenous and richer in carbonaceous food; its ash furnishes but 0.47 per cent. of iron, while those of flesh and wheat flour yield 1 per cent. It is not digested so quickly as would be supposed, and in this respect boiled has the advantage of unboiled milk; the one took St. Martin 2 hours, the other 2½, to convert into chyme. Milk disagrees with many persons; this is often connected with the readiness with which it undergoes change when exposed to the atmosphere, and this change commences long before it can be recognized by the taste. Milk just drawn from the cow agrees perfectly with some persons who are unable to take it a few hours later. When cows are kept in an impure and confined atmosphere and badly fed, it has been conclusively shown that their milk produces disturbance of the digestive organs and diarrhœa in infants who are fed upon it. The caseine of milk, coagulated, generally mixed with more or less butter, and pressed so as to free it from the whey, constitutes cheese. Its richness varies with the quantity of butter it contains; some varieties, Stilton for instance, are made from milk to which an additional quantity of cream has been added. Salt is used to preserve it, and some kinds, as Dutch cheese, are very highly salted. When cheese is kept for a length of time, it undergoes a number of changes, partly dependent on the liberation of the volatile fatty acids existing in the butter, partly, in the richer varieties, on the commencement of putrefactive fermentation. The firm, close texture of cheese renders it always hard of digestion, and the rich and strong-smelling varieties are particularly to be avoided by delicate stomachs. Fresh sweet butter is, perhaps, the most wholesome and digestible of fatty matters; by heating or rancidity its digestibility is greatly impaired.—Of farinaceous articles, light well made wheaten bread, from 12 to 24 hours old, is the most generally digestible; warm bread is indigestible, because it forms a tough mass not readily penetrated by the saliva and rebellious to the gastric juices. Unleavened bread, maccaroni, and vermicelli are wholesome, and agree well with the stomach; on the other hand, flour combined with fatty matter, whether in the form of pastry, cake, or pudding, is more or less indigestible, according to its texture and richness. Next to wheat flour, rye affords the best and most wholesome bread. In various countries oatmeal, barley, and maize are used as substitutes for wheat; they form kinds of bread wholesome enough for those habituated to their use, but apt to disagree with strangers. In tropical countries rice to a great extent takes the place of the other cereals, and perhaps a larger population mainly subsist on it than on any other single article of food. It affords very little of plastic or blood-making material, and hence when taken alone is con-

sumed in enormous quantity; as an adjunct it forms an unstimulating and digestible article of food. The leguminous seeds, peas and beans, afford a nutriment rich in plastic matter, but hard of digestion and predisposing to flatulence. The popular prejudice that sugar produces caries of the teeth has no good foundation. Closely allied to sugar are the various forms of fecula, arrowroot, tapioca, sago, potato starch, &c. They consist of minute granules composed of concentric layers, and termed the starch grains. These grains must be softened and hydrated by boiling, roasting, or panification before the starch is fit for use. It then forms an unstimulating and readily digestible ingredient of the food. Vegetables constitute an important part of our diet. With few exceptions their nutritive value is low; they consist largely of water holding organic salts in solution, of starch granules, of small quantities of albuminous matter, and of cellulose and epidermis. The cellulose, though possessing a chemical constitution identical with that of starch, when at all firm, resists the action of the gastric juice, and passes unchanged through the intestinal canal. They are valuable on account of their large quantities of organic salts, of the bulk which they give to the food, and of their stimulating effect upon the peristaltic action of the intestines. These latter qualities make them disagree where the digestive organs are feeble and irritable. They are digestible in proportion to their tenderness and the readiness with which they can be broken up into a pulp. The potato is one of the most valuable of the nutritious vegetables. St. Martin found potatoes roasted and baked disposed of more readily than when boiled, the one taking 2½ hours to be converted into chyme, the other an hour longer. The same rule applies to fruits as to vegetables; they are digestible just in proportion to the readiness with which they can be completely reduced to a pulp. Ripe strawberries, peaches, oranges, and grapes rarely disagree, while cherries, apples, pears, &c., are more indigestible; roasting improves the digestibility of apples and of most of the more solid fruits.

DIETZ, Fedor, a German painter, born at Neuenstetten, Baden, in 1813, died near Dijon, in France, Dec. 18, 1870. He was president of the art academy at Carlsruhe, and was famous for his battle pieces. His most celebrated pictures are the "Death of Gustavus Adolphus and Pappenheim at Lützen," the "Storming of Belgrade by Max Emanuel," and "Queen Eleonore of Sweden at the Grave of Gustavus Adolphus." The two last named are in the Munich athenæum. He died while presiding over the German sanitary organization in France.

DIETZ, Friedrich Christian, a German philologist, born in Giessen, March 15, 1794, died May 29, 1875. He studied philology at Giessen and Göttingen, and in 1823 became professor at Bonn. He wrote *Altspanische Romanzen* (Berlin, 1821); *Beiträge zur Kenntniss der romanischen*

Poesie (Berlin, 1825), republished in French under the title of *Essai sur les cours d'amour* (Paris, 1842); *Die Poesie der Troubadours* (1826); and *Leben und Wirken der Troubadours* (1829). Though these works were rapidly translated into French and English, he owes his reputation mainly to his *Grammatik der romanischen Sprachen* (3 vols., Bonn, 1836-42), and *Etymologisches Wörterbuch der romanischen Sprachen* (Bonn, 1853), translated into English by T. C. Donkin (London, 1864).

DIFFRACTION OF LIGHT. See LIGHT.

DIGAMMA (double gamma; so called from its form, F, resembling two gammas, Γ), the sixth letter in the ancient alphabet of the Greeks, corresponding to the Hebrew ו and the Latin *v*, and probably equivalent in sound to the English *w*. It continued latest in the Æolic dialect, but early became obsolete in the Attic alphabet, and subsequently in the Greek language; though its original existence is indicated by the fact that the fifth letter (ε) is the numerical symbol for 5, but the next letter (ζ) for 7. It does not appear in the Homeric poems as usually published, though they were composed when it was in use; but its force remained in the metre after its form had disappeared, and its latent existence at the beginning of many words and syllables apparently commencing with a vowel made preceding short syllables, if ending with a consonant, long by position, or, if ending with a vowel, prevented a hiatus. In words of the Latin language etymologically connected with Greek words which were originally written with the digamma, it is represented by *v*, thus: *ἑσπερος* (ΦΕΙΠΕΡΟΣ), *vesperus*; *ὄνυξ*, (ὄνυξ), *ovum*.

DIGBY, a W. S. W. county of Nova Scotia, bordering on the Atlantic; area, about 1,300 sq. m.; pop. in 1871, 17,037. Long island and Digby neck, a long headland, enclose St. Mary's bay on the N. W. The surface is diversified with numerous mountains, valleys, and lakes, the last named giving rise to several rivers. Copper and silver ores are found. Capital, Digby.

DIGBY. I. Sir **Kenelm**, an English philosopher, born at Gothurst, Buckinghamshire, in 1603, died in London, June 11, 1665. He was the son of Sir Everard Digby, who was executed in 1606 for complicity in the gunpowder plot. He was educated in the Protestant faith, and showed early tokens of talent. In 1621, having finished his education at Oxford, he visited the continent, where he travelled for about two years. After his return he was made gentleman of the bedchamber by Charles I., and held several offices. In 1628 he sailed with a squadron fitted out at his own expense, to fight the Algerines and the Venetians, with whom the English had quarrelled, and gained much credit by his courage and success. In 1636, while in France, he became a convert to Catholicism. He returned to England in 1638, sided

with the king in the dissensions of the time, and was imprisoned by order of parliament. During his confinement he wrote several treatises. He was released in 1643 at the intercession of the queen of France, and retired to that country, where he was received with great honor. From this time till 1661 he lived mostly on the continent, and especially in France, employing himself with literary and scientific labors. Having returned to England, he enjoyed the favor of Charles II., and continued his philosophical studies until his death. He married a daughter of Sir Edward Stanley, and his curious experiments to preserve her extraordinary beauty gave him quite as much celebrity as his books. His principal works are: "A Conference with a Lady about the choice of a Religion" (Paris, 1638); "Observations on Religio Medici" (London, 1643); a "Treatise on the Nature of Bodies" and "Treatise on the Soul, proving its Immortality" (Paris, 1644); a "Treatise of adhering to God" (London, 1654); "Of the Cure of Wounds by the Powder of Sympathy" (London, 1658); and "Private Memoirs of Sir Kenelm Digby, &c., written by Himself," first published in 1827.

II. Kenelm Henry, an English author, descended from an uncle of the preceding, born in 1800. His father, the Rev. William Digby, was dean of Clonfert, Ireland. He graduated at Trinity college, Cambridge, in 1823, embraced soon after the Roman Catholic faith, studied scholastic theology and the literature and antiquities of the middle ages, and devoted himself exclusively to the illustration of mediæval times and manners. In 1826-'7 he published "The Broad Stone of Honor: on the Origin, Spirit, and Institutions of Christian Chivalry." Pursuing with unflagging industry his archæological studies in the various countries of continental Europe, the fruits of his research appeared anonymously from 1844 to 1847, under the title of "Mores Catholici, or Ages of Faith" (3 vols. royal 8vo, London). In 1851 appeared "Comptum, or the Meeting of the Ways at the Catholic Church;" in 1856, "Lover's Seat: Kathemérina" (2 vols. 12mo); in 1858, "Children's Bower, or What You Like" (2 vols. 12mo); in 1860, "Evenings on the Thames" (2 vols. 12mo; 2d ed., 1864); and in 1861, "The Chapel of St. John, or a Life of Faith," being a memorial to his deceased wife.

DIGESTION (Lat. *digerere*, to dissolve or concoct), the liquefaction and preparation of the food in the alimentary canal. The organs by which this function is performed in the higher animals are the mouth, pharynx, œsophagus, stomach, and intestines, with their accessory salivary glands, pancreas, liver, and mucous follicles. The first act to which food is subjected is the mechanical division by the teeth. This process is important in order to reduce the food from a crude mass to a finely divided pasty condition, in which it is more readily and thoroughly affected by the digestive se-

cretions of the alimentary canal. While some of the nutritive matters are dissolved in and absorbed directly from the stomach, others require further preparation, and are taken up by the vessels and absorbents of the intestines; by the time that the residue arrives in the cæcum, almost all the alimentary matter has been extracted, and the insoluble portions with the excess of biliary and mucous secretions are voided at the anal termination of the canal. The digestive process can hardly be separated from absorption, which takes up the nutritive materials, and assimilation, which converts them into a fluid resembling blood, poured into the circulation near the heart. Though inorganic substances are necessary for the support of the body, the organic alone are generally considered as food and as subjects for the digestive process. Organic substances used as food may be conveniently arranged under three heads: 1, the saccharine group, embracing substances composed of oxygen, hydrogen, and carbon, resembling sugar in composition, and readily convertible into it; such are starch, gum, woody fibre, and the cellulose of plants; 2, the oleaginous group, with a great preponderance of hydrogen and carbon, small proportion of oxygen, and absence of nitrogen, including vegetable oils and animal fats; 3, the albuminous group, containing a large proportion of nitrogen, comprising animal and vegetable substances allied in chemical composition to albumen and animal tissues. The saccharine substances taken as food do not directly form part of any animal tissue, but are decomposed in their passage through the circulation, and are thus employed in some unknown way in the nourishment of the body. Starch is converted into sugar during digestion, and the sugar thus formed, as well as that taken under its own form with the food, is decomposed and appropriated as above. These substances, however, are not sufficient by themselves for the support or growth of the body, as is proved by the death from inanition of animals fed exclusively upon them. The articles of the albuminous group serve not only for nutrition, but for the maintenance of heat by their decomposition; the proportion of their four elements is the same in all, and they are all capable of reduction to a like condition by the digestive process, so that, as far as nutrition goes, the fibrine of animals, the albumen of eggs, the casein of milk, and the gluten of wheat are equally acceptable to the organism. No one of these, however, is alone sufficient to support life. It is very remarkable, as Dr. Prout has observed, that milk, the only single article of food naturally provided for the continued growth of animals, contains albuminous casein in its curd, a good deal of oily matter, and considerable sugar.—Supposing mastication to have been thoroughly performed, the food is first acted upon by the salivary fluid, which is secreted by the parotid, sublingual, and submaxillary glands, and the fol-

follicles of the mucous membrane of the month. Saliva is but little heavier than water, contains minute corpuscles and epithelial scales, and in health has an alkaline reaction greatest during and after meals. It consists of about 995 parts of water in 1,000, and 5 parts of solid matters. Of the latter the most remarkable is ptyaline, to which the peculiar properties of the fluid are due; it closely resembles, but is not identical with, albumen and caseine; it acts the part of a ferment, and, according to Mialhe, 1 part is sufficient to convert 2,000 parts of starch into sugar; it also contains a compound of sulpho-cyanogen, not known to occur in any other animal product, and interesting in a medico-legal point of view. Its salts are nearly those of the blood, and its alkaline reaction seems to be due to the basic phosphate of soda. The "tartar" of the teeth and salivary concretions consist principally of earthy phosphates and animal matter. The limpid secretion of the parotid and sublingual glands saturates the food during proper mastication, while the viscid submaxillary fluid facilitates swallowing. The amount of saliva secreted daily by man will average, according to Biddler and Schmidt, $3\frac{1}{2}$ lbs., though it varies with the character and frequency of the meals. Besides its mechanical action, the saliva, by its peculiar ferment, has the power of acting chemically upon the farinaceous elements of the food, leading to the conversion of the starch into sugar; but there is reason to believe that this action does not go on in presence of the acid of the stomach. There is no satisfactory evidence that saliva exerts any other than a physical action upon nitrogenized substances. When the food reaches the stomach the digestion is continued by the gastric juice, secreted by the numerous follicles of the mucous membrane, lined with glandular epithelium. The nature of the digestive process has been the subject of much speculation. It was at first supposed that the aliments underwent a coction similar to that which they would experience in a vessel with hot water; to this succeeded the theory of acid fermentation, then of putrefaction, of trituration, and of maceration, till the present belief in the solvent action of the gastric juice was established. The gastric juice is transparent, nearly colorless, and without viscidty. Its most characteristic feature is acidity, which is even perceptible to the taste. Many eminent chemists maintain that the real agent in the solvent process is free lactic acid, while others are in favor of free hydrochloric acid; the former opinion seems to be more fully borne out by the results of experiment. The peculiar organic ferment of the gastric juice is pepsin, which disposes albuminous matters to undergo solution by the contained acid, which they would otherwise only partially do unless exposed to a high temperature. The secretion of the empty stomach is neutral or alkaline, but it becomes acid on the introduction and during the diges-

tion of food, resuming its neutral character when this process is finished. From the experiments of Dr. Dalton, it appears that an ounce of gastric juice of the dog will dissolve a little over 30 grains of fresh lean meat; at this rate the full digestion of a pound of raw meat would require two gallons of gastric juice; and this apparently enormous quantity will not be considered incredible, if it be recollected that this fluid after it has done its work of solution is at once reabsorbed into the circulation, so that even this quantity might be secreted during the three or four hours of the digestive process, at an expense to the blood of not more than 2 or 3 oz. of fluid at any one time; the fluid does not accumulate in the stomach, but its watery portions are in continual process of secretion and reabsorption as long as any food remains undigested, within reasonable limits as to quantity ingested. Many of the most important phenomena of gastric digestion were first demonstrated about 1830 by the experiments of Dr. Beaumont on Alexis St. Martin, through an opening in whose stomach the effect of food, stimulants, and sedatives could be seen. The color of the membrane was pale pink, its appearance velvet-like, and its surface lined with a transparent viscid mucus; the stimulus of food caused the gastric follicles to enter into activity, and to pour out the acid gastric juice; small quantities of very cold water, or ice, after the primary sedative effect, caused turgidity of the membrane and copious secretion, while ice in large amount and long continued retarded the process. The amount of gastric juice secreted depends on the requirements of the system, and not on the quantity of food taken into the stomach; this is most important to be remembered, since, after the fluid secreted has dissolved all it can, any excess of food must remain undigested, pass into the intestines in a crude state, and become a source of pain and irritation until it is expelled. When the system is diseased, there is no craving for food, which if taken would not cause the secretion of the gastric juice, but would remain undigested for an indefinite time, adding its irritation to the general diseased state. The secretion of gastric juice is influenced by, though not dependent on, nervous agency; it is well known that strong mental disturbance will put a stop to the digestive process, and section of the pneumogastric nerves arrests for a time the elaboration of the gastric fluid. There can be no doubt that gastric digestion is essentially a process of chemical solution, the solvent fluid being prepared by the follicles of the stomach, and its action assisted by the peristaltic muscular movements of the organ; the experiments on St. Martin, and those subsequently performed on the lower animals, fully prove these facts, both in natural and artificial digestion.—Rapidty of digestion depends so much on the quantity and quality of the food, the state of health, the condition of the mind, and

the habits of exercise, that it is difficult to determine the relative digestibility of different articles of diet. It appears from Dr. Beaumont's researches that, other things being equal, the flesh of wild animals is more easily digested than that of the allied domesticated races; in this respect venison stands first, then turkey, then mutton, beef, and veal, in the order mentioned. A certain bulk of food is necessary for healthy digestion, as has long been practically known by uncivilized nations; soups and fluid aliment are not more readily chymified than solid substances, and cannot alone support the system in vigor. Moderate exercise before a meal facilitates digestion. A temperature of 98° to 100° F. is requisite for the perfect action of the gastric juice; hence the ingestion of cold and iced substances, if carried to such an extent as to depress the temperature of the stomach, must be very prejudicial to digestion. The most recent experiments go to show that the action of the gastric juice is confined to nitrogenized substances, and that it exerts no influence on starchy, saccharine, or oily matters. Its action on albuminous matters is to reduce them to a complete solution, alter their chemical properties, and convert them into albuminose (a kind of modified albumen), in which form they are readily assimilated. In this condition they form definite combinations with the solvent liquid, which have been called peptones. These are not mere solutions of the respective substances in acidulated fluids; for a converting power is exerted by the pepsin, the solvent power being due to the acid of the gastric juice. The process of digestion is far from being completed in the stomach, but goes on in the intestine by the continued action of the gastric juice, as well as by that of the pancreatic and intestinal juices. Of these, the intestinal juice seems to have the power of rapidly transforming starchy matters into a form of sugar, while the pancreatic juice, on coming in contact with the fatty elements of the food, converts them into a finely divided milky-looking emulsion, known as chyle. All these substances, the fluid products of digestion, are then gradually taken up by the blood vessels and lacteals of the alimentary canal, and mingled with the general mass of the circulating fluid; until in the lower part of the intestine there are left only the indigestible and refuse parts of the food, mingled with the excrementitious substances of the large intestine. (See ALIMENT, ALIMENTARY CANAL, and DIETETICS.)

DIGGES. I. Leonard, an English mathematician, born in the parish of Barham, Kent, died about 1574. He was educated at Oxford, possessed an ample fortune, and devoted himself to mathematical studies. He wrote "Tectonicum, briefly showing the exact Measuring and speedy Reckoning of all manner of Lands, Squares, Timber, Stones, Steeples, &c." (1556); "Pantometria, a practical geometrical treatise (1591); and "Prognostication Everlasting of

right good effect, or Choice Rules to judge the Weather by the Sun, Moon, and Stars" (1555).

II. Thomas, son of the preceding, died in 1595. He graduated at Oxford, adopted the profession of a soldier, and was appointed muster-master general of the forces sent out by Elizabeth to assist the Netherlands. He wrote several mathematical treatises and other works, among which are: *Ala, seu Scala Mathematica* (1573); "A Letter on Parallax" (1573); and "A Perfect Description of the Celestial Orbs according to the most ancient Doctrine of the Pythagoreans" (1592).

DIGITALIS, a genus of exogenous plants belonging to the natural order *scrophulariaceae*. *Digitalis purpurea* (Linn.), purple foxglove, is a small herb found wild in Europe about hedges on banks of streams, in a gravelly or sandy soil. Calyx 5-parted, unequal; corolla campanulate, the limbs obliquely 4-lobed; stamens 4; stigma simple; capsule ovate-acumi-

Digitalis purpurea.

nate; root of numerous long slender fibres, biennial; stem erect, 3 or 4 ft. high, commonly simple roundish with slight angles, downy; leaves dull green, alternate, ovate-lanceolate or elliptic-oblong, crenate, downy, rugged, and veiny, tapering at the base into winged footstalks, lower ones largest; raceme terminal, long, simple, of numerous large, pendulous, odorless flowers. Fuchs is regarded as the earliest botanist who mentions this plant, which he named *digitalis* (Germ. *Fingerhut*, thimble), on account of the blossoms resembling the finger of a glove. The term fox-glove occurs in a MS. *Glossarium Ælfrica*, written before the Norman conquest, and in a MS. Saxon translation of Apuleius, both of which are among the Cotton MSS. in the British museum; but no Latin or Greek name was given to this plant previous to Fuchs in 1542.—This beautiful plant derives its chief interest from its medicinal properties, which reside in the leaves and seeds, the latter being small, round-

ish, and grayish brown. Its active principle is digitaline, a white, inodorous bitter substance, which crystallizes with difficulty in microscopic plates. It is sparingly soluble in water, moderately soluble in ether, freely so in alcohol. Its composition has not been determined with certainty. The most characteristic test is the beautiful pure green color which it assumes when added to a small quantity of phosphoric acid, concentrated as much as possible on a watch glass, the acid at the same time turning yellow. The effect of digitalis has been tried on dogs, horses, rabbits, turkeys, domestic fowl, and frogs, and on all it has been found to act as a poison. The cerebro-spinal symptoms observed in animals are diminished muscular power, convulsive movements, tremors, and insensibility. When given in small doses to man, it is found to exercise a remarkable influence over the circulation, frequently reducing the pulse from 70 or 80 to 40 or 50 beats in the minute. According to recent views, the beats of the heart, although retarded by digitalis, are rendered more vigorous by it, and at the same time the smaller arteries are contracted, so that their tension is maintained, and in some diseases increased, in spite of the slow pulse. The therapeutic effects of digitalis, including its diuretic action, depend almost wholly upon the improved tone of the heart and blood vessels which it brings about. Small doses of it in health generally, but not always, increase the water of the urine to a slight degree, the solids undergoing but little change. When poisonous doses are approximated, the force of the heart and tension of the arteries fall, and the pulse becomes first irregular, and afterward rapid. Nausea and vomiting are early toxic symptoms. It should be borne in mind that a toxic condition may be suddenly developed during the use of digitalis as a medicine, in consequence of its accumulation in the system. Its undoubted beneficial effects in organic diseases of the heart can in most cases be best attained and preserved by keeping the dose strictly within the limits of what has just been described as the first stage of its action; that is, the stage in which the tension of the blood vessels is maintained. Digitalis is used chiefly in organic diseases of the heart, to fulfil indications suggested above. Its effect in dropsies, and possibly in some nervous affections, is secondary. The infusion, tincture, leaves in powder, and granules of digitaline are all used in medicine. Its effects may also be obtained by the application to the abdominal surface of cloths steeped in an infusion of it. The dose of the infusion is about a table-spoonful; of the powdered leaves, a grain; of the tincture, 10 to 15 drops; of digitaline, $\frac{1}{10}$ of a grain. Large quantities of digitalis are quite inert, either from too long keeping or from having been taken from immature plants.

DIGITIGRADES, the tribe of the typical carnivora, so called because they walk on the

ends of the toes, as distinguished from the plantigrades, which, like the bear, place the whole foot upon the ground. This tribe includes the *mustelidæ* or weasels, the *canidæ* or dogs, and the *felidæ* or cats. All have the cheek teeth with cutting edges, the lower shutting within the upper, dividing the flesh of their prey like the blades of scissors. As their food would indicate, they have a simple stomach and a short intestine. Their carnivorous propensity may be measured by the tubercle or heel on the lower carnivorous tooth, and the number of false molars in front and of tuberculous teeth behind it; those having the simplest carnivorous teeth, and the fewest molars in front and behind, like the cats and the weasels, are the most sanguinary. The characteristic marks in the skeleton are the long metacarpus and metatarsus, the elevation of the os calcis, and the shortness of the phalanges which alone rest upon the ground; and in the cats, the retractile claws. The extremities are formed for leaping and springing; from the pelvis as the fixed point, the three portions of the limbs are movable in alternately opposite directions; by the simultaneous flexion of these joints, and their sudden extension by powerful muscles, the greatest force is given to the spring, the elevated and elongated heel affording the principal mechanical advantage in the digitigrade foot.

DIGNE (anc. *Dinia*), a town of Provence, France, capital of the department of Basses-Alpes, situated near the Bléone, 69 m. N. N. E. of Marseilles; pop. in 1866, 7,002. It is the seat of a Catholic bishop, a court of the first resort, a communal college, a theological seminary, and a normal school. It has a public library of about 3,000 volumes, and manufactories of leather, cloth, and hats. Its situation is picturesque, but the streets are crooked, and the houses very poor. In 1629 the plague reduced the population from 10,000 to 1,500.

DIJON (anc. *Divio*), a town of France, formerly capital of the duchy of Burgundy, now of the department of Côte-d'Or, situated at the confluence of the rivers Ouche and Suzon, on the railway from Paris to Lyons, 160 m. S. E. of Paris; pop. in 1866, 39,193. It is of an oval form, with several suburbs, and lies at the foot of a chain of mountains in a fertile vale. It is generally well built, has numerous handsome public places and elegant houses, is enclosed by ramparts, and its environs furnish delightful promenades. It contains many remarkable buildings, the principal of which are the cathedral, formerly the Cistercian abbey of St. Benigne, a massive edifice founded in 535 and rebuilt in the 12th century, and again in the 13th, which contains the magnificent mausoleums of Philip the Bold and of John the Fearless; the church of Notre Dame, built in the 13th and 14th centuries; the church of St. Michael, which dates from the 16th century, remarkable for its front and its castle-like solidity; an ancient castle, the work

of Louis XI., which served for a time in the 18th century as the prison of the duchess de Maine, Mirabeau, and the chevalier d'Eon; and the ancient palace of the dukes of Burgundy, subsequently the *palais des états*, now occupied partly as a town hall and partly as a museum of painting and sculpture, containing numerous relics of the middle ages, and a library of 70,000 printed volumes and 800 to 900 MSS. The tower is now used as an observatory. The hall of justice, an ancient edifice, was the parliament house of Burgundy. The theatre is one of the finest in France. Dijon is the seat of a bishop and of courts of appellate and original jurisdiction. It is well provided with benevolent and educational in-

Cathedral of Dijon.

stitutions, including two hospitals, an orphan asylum, two prisons, a cabinet of natural history, a botanic garden, a university with 16 professors and faculties of law, science, and literature, eight colleges, a normal school, and schools of fine arts and medicine. It has manufactories of linens, hosiery, vinegar, and candles, distilleries, bleacheries, sugar and wax refineries, tanneries, breweries, and establishments for the manufacture of *liqueur de cassis* or black-currant wine. It is the principal market for the sale of Burgundy wines, and there is also a large trade in grain, flour, and wool.—The origin of Dijon is traced back to times preceding the Roman dominion. Under Marcus Aurelius it was surrounded by walls flanked with towers, and it was embellished

and enlarged by Aurelian. It was burned by the Saracens in the 8th century, sacked by the Normans in the 9th, and again ravaged by fire in 1127. It was for three centuries the residence of the dukes of Burgundy, by whom its present fortifications were constructed. In 1513 it was besieged by the Swiss, and saved itself only by a humiliating treaty. On Oct. 30, 1870, there was a sharp encounter between a division of the German corps of Gen. Von Werder and the advance troops of the French army of Lyons, which led on the next day to the capitulation of the town and its occupation by the Germans. On the approach of the army of Bourbaki the town was evacuated by the Germans, Dec. 27. On Jan. 21 and 23, 1871, severe fighting again took place near Dijon between the Garibaldians and portions of the second German army corps; the latter were finally compelled to retreat, leaving behind them a flag, the only one lost in the war. Dijon is the birthplace of some of the most eminent men of France, including Bossuet, Crébillon the elder, Piron, Cazotte, Guyton de Morveau, and Maret, duke of Bassano.

DIKE (Dutch, *dijk*, from the root of *dig*).

1. Primarily a ditch, but now more commonly a wall or embankment intended to restrain the flow of water. Such earthworks were in former times a common means of defence, and were built around castles and fortresses. In Holland are the most remarkable dikes in the world, constructed to prevent the overflow of the lands reclaimed from the sea. Their importance may be appreciated from the fact that a single inundation from the sea in the year 1277 caused the destruction of 44 villages; and in 1287 80,000 persons were destroyed by another, and its present extent and shape were given to the Zuyder Zee. In the 15th century about 100,000 persons were destroyed through the imperfection of the dikes, when their construction was undertaken in the most thorough manner, and a law was enacted enforcing their being kept in order. At present this work is conducted on a systematic plan and at great cost. Embankments are made toward the sea with heavy timbers filled in with stone, and the surface is covered with bundles of flags and reeds fastened down by stakes. Piles also are driven into the sand, and protected by planking as well as by earth, turf, and stones. These artificial dikes are often 40 ft. above ordinary high water, and wide enough at top for a common roadway. Frequently the slopes are covered with wickerwork made of willow twigs, and the willow tree is extensively cultivated to furnish supplies of these, which require frequent renewal, as also to bind together by its roots the loose sands. Walls of masonry are built in some of the most exposed situations, and rows of piles outside protect the dikes from the action of the waves. The expenditure in Holland for maintaining dikes and regulating the water levels is annually from \$2,000,000 to \$2,500,000. Engineers are constantly employed,

and every provision is made of materials that may be required for immediate repairs. During the winter months watchmen patrol the dikes by day and night, and give alarm whenever the tide threatens to overflow. The people then hasten to the point, and with mats of straw and rushes and large sheets of sail cloth buried in the sand they raise a temporary bulwark, to be more securely built before the approach of the next tide.—Dikes constructed as barriers for reservoirs are built on several well established plans. The loose materials excavated for the channel or basin are piled up in a firm bank and consolidated by rolling with heavy rollers. Sometimes they are rendered more secure by building within them along their central line a puddle bank of selected clayey earth, mixed with sufficient sand to give it tenacity, so as not to crack in drying. This should be carried down to a solid foundation, and may be advantageously bedded upon a layer of concrete. It is built up a little later than the bank on each side of it, and both are rolled on the addition of every layer of six inches with a heavily ribbed roller of cast iron. The use of any material of the nature of quicksand is to be carefully avoided in any part of the embankment. Next the water it is well to face the work with a layer of broken stone that will pass through a two-inch ring, and over this should be laid a sloping wall of flat stone at an inclination of 1 base to 1 vertical, or from that to one of 3 base to 1 vertical. The broken stone within is a guard against the embankment being penetrated by any small water animals. The dike around the great reservoir of 106 acres in the Central park, New York, is made on the plan given above, which is approved by the engineers of France and England. It is 16 ft. 8 in. wide at top, with an inner and outer slope of 1½ base to 1 vertical. The puddle bank of clay in the middle, which reaches to within a few feet of the top, is 16 ft. thick. The depth of water around the margin is 34 ft. At the surface of the water the thickness of the embankment is 24 ft. 9 in., and at 30 ft. below it is 114 ft. 9 in. The French engineers give the preference to this mode of construction over that of a wall of masonry alone or of an embankment within a wall. Stonework by settling is liable to injury that can be repaired only at great cost, especially if the structure be concealed within an embankment. Where room is an object, as in the streets of a city, the outer sides of the dike are conveniently held up by steep walls of stone, which add neither to the strength nor to the impermeability of the work. **II.** In geology, a wall of trap or other igneous rock, which traverses other rocks, and appears to have been produced by the flowing of melted matter into a deep rent or fissure. Dikes are distinguished from veins by the greater uniformity of their contents, by the parallelism of their sides, by their not ramifying into smaller veins, and by their usually larger dimensions. The name

was given them from their frequently projecting above the surface like a wall, owing to the degradation of the softer rock around them, dike being in the north of England and in Scotland a provincial name for wall. They are from a few inches to more than a mile in thickness. In volcanic eruptions they are seen in process of formation, as deep rents open and are filled with liquid lava. In the English coal mines trap dikes are occasionally met with, forming walls across the line of the coal beds, cutting them off, and causing them at times to be thrown out of place. In the United States they occur likewise in the gold mines of North Carolina. In the Connecticut valley, in fissures of sandstone, as well as in New Jersey, the trap dike contains copper ore, indicating that the copper veins in these rocks have a common origin with the dikes, and also with the barytes which forms the gangue or matrix of the vein. Prof. Dana remarks that the triassic formations along the Atlantic appear to be a repetition of the processes which occurred in the Huronian and Potsdam periods in the Lake Superior region. The trap rocks of Lake Superior are often remarkable for the grandeur of their basaltic walls and columns.

DILKE. I. Charles Wentworth, an English journalist, born Dec. 8, 1789, died Aug. 10, 1864. He graduated at Cambridge, and early found employment in the navy pay office, where he remained 20 years. In 1830 he became editor and proprietor of the "Athenæum," which speedily rose to a high rank in English periodical literature. In 1846, having intrusted the editorship of the "Athenæum" to Mr. Thomas Kibble Hervey, Mr. Dilke undertook that of the "Daily News," from which he retired in 1849. A valuable collection of "Old English Plays," in 6 vols., was edited by him in 1814. **II.** Sir Charles Wentworth, son of the preceding, born in London, Feb. 18, 1810, died in St. Petersburg, May 10, 1869. He was educated at Westminster school and Cambridge, and from his interest in art was one of the earliest and most active promoters of the crystal palace exhibition of 1851. He declined the knighthood offered him for his services on this occasion, and also refused any pecuniary reward. He was a commissioner to the New York crystal palace exhibition in 1853, and one of the five royal commissioners of the second London exhibition in 1862, in which year he was created a baronet. He was active in the society of antiquaries and the royal geographical society. He sat in parliament for Wallingford from July, 1865, to November, 1868. **III.** Sir Charles Wentworth, an English author and politician, son of the preceding, born in Chelsea, Sept. 4, 1843. He was educated at Cambridge, where he graduated in 1866, and was called to the bar. He travelled in Canada and the United States, crossing to the Pacific coast, and sailing thence for Australia and the other British colonies in the South sea. The result of these travels he

published in "Greater Britain: a Record of Travel in English-speaking Countries during 1866-'7" (2 vols., 1868). In 1868 he was elected to parliament from Chelsea, by a majority of two to one over Dr. W. H. Russell. On the death of his father he became editor of the "Athenæum." In politics he is a republican, and has attracted much attention by his attacks on the monarchical system.

DILL, the common name of the *anethum graveolens* (Linn.), an annual plant of the natural order *umbellifera*, a native of Spain, but naturalized in the south of France and Germany, and cultivated in gardens in the United States. It has an upright smooth stem, much dissected leaves, yellow flowers, and small oblong seeds, with sharp, filiform dorsal ridges. The seeds and oil distilled from them are aromatic, but have no properties to distinguish

Dill (*Anethum graveolens*).

them from many other members of the same class of substances. The seeds are imported in large quantities from the south of France into England, where they are employed in the manufacture of British gin. In Germany they are used in pickling cucumbers and in the flavoring of sour crout.

DILLENUS, Johann Jakob, a German botanist, born in Darmstadt in 1687, died in Oxford, April 2, 1747. His grandfather was called Dill and his father Dillen, which the son Latinized into Dillenius. He studied at the university of Giessen, and was received into the society of "Inquirers into Nature," under whose auspices he published a "Dissertation upon the Plants of America naturalized in Europe;" a "Treatise upon Coffee," with an account of the substances which might displace it, giving the preference to burnt rice; and a volume of "Observations upon the Mode of Development of Ferns and Mosses," in which he confirmed the theory of different sexes in plants. He first obtained a reputation among naturalists by his *Catalogus Plantarum circa Gissam nascentium*,

published in 1719. William Sherard, a scientific English traveller, persuaded Dillenius to leave Germany for England. He arrived in London in 1721, and had a fine garden at Eltham placed at his disposition by James Sherard, a brother of William. He edited an enlarged edition of Ray's "Synopsis of British Plants," with engravings of his own. In 1728 William Sherard died, and founded by his will a chair of botany at Oxford, to which Dillenius was appointed, who in 1732 published his *Hortus Elthamensis*, containing not only descriptions of plants arranged in alphabetical order, but also 324 plates engraved by himself. This work was enthusiastically received by his contemporaries, among others by Linnæus, then commencing his labors. In 1741 he published his *Historia Muscorum*, which places him in the first rank of the botanists of the last century. He was more than 20 years in collecting the materials of this work. The plates (numbering 85) and the descriptions were all by his own hand. He published no subsequent work, but many of his drawings and collections are preserved in the Sherardian museum at Oxford. Linnæus dedicated to him a magnificent genus of plants of tropical India, which is the type of the family of the *Dilleniaceæ*.

DILLINGEN, a town of Bavaria, in the circle of Swabia, on the Danube, 22 m. N. W. of Augsburg; pop. about 5,500. The university, founded in 1549, and from 1564 to 1773 under the management of the Jesuits, was abolished in 1804. There is now a lyceum with a library of 75,000 volumes. Other conspicuous buildings are the Jesuit college, the palace of the bishops of Augsburg, and a royal castle. It has an asylum for the deaf and dumb. A new bridge has recently been thrown over the Danube, and a canal to Lauingen has been constructed to avoid the windings of the river between the two places. The town belonged to the bishop of Augsburg till 1803, when he was deprived of his secular estates.

DILLMANN, Christian Friedrich August, a German orientalist, born at Illingen, Würtemberg, April 25, 1823. He studied at Tübingen, and after a visit to the oriental museums of Paris and London resided for several years at the university as a private teacher. In 1854 he became professor of oriental languages at Kiel, and in 1864 professor of Old Testament exegesis at Giessen. In 1869 he succeeded Hengstenberg at the university of Berlin. His fame rests mainly on his great labors in behalf of the Ethiopic language. His principal works are: *Grammatik der äthiopischen Sprache* (Leipsic, 1857); *Lexicon Lingue Æthiopice* (1862-'6); and *Biblia Veteris Testamenti Æthiopica* (2 vols., 1853-'72).

DILLON, Peter, a British navigator, born about 1755, died in 1847. He early entered the merchant service, and barely escaped being murdered by the Feejee islanders while lieutenant of an East Indian ship. In 1826 he met three of his former companions on an

island in the South sea, where they had been left 13 years before. One of these men had learned that two vessels had been lost on one of the Vanikoro islands, and had discovered some of the articles found on the wrecks. Dillon recognized these as having belonged to the expedition of La Pérouse, and returning to Pondicherry was put in command of a vessel, which in July, 1827, reached Whannon, an island of the Vanikoro group, where were found additional traces of the expedition of La Pérouse. Dillon reached France on his return in February, 1829, and received from Charles X. a gift of 10,000 francs and a pension of 4,000. He wrote a narrative of his expedition, under the title of *Voyage aux îles de la mer du Sud, 1827 et 1828, et relation de la découverte du sort de La Pérouse*.

DILMAN, a town of Persia, in the province of Azerbaijan, 75 m. W. by N. of Tabriz, on a stream flowing E. into the N. end of Lake Urmiah, 10 m. distant; pop. about 15,000. It is a modern town, situated in an extensive and fertile valley, and surrounded by gardens, with more cleanly streets than those of older Persian towns. About 4 m. W. is a decayed ancient town of the same name.

DILUVIUM, or *Drift*, the superficial deposits of clay, sand, gravel, and bowlders which in both hemispheres are spread more or less uniformly over the land of the polar regions and the adjacent portions of the temperate zones. Geologically this deposit is very recent, and is found overlying strata of later tertiary or pliocene age. Inasmuch as great portions of the material of which it is composed seem to have been transported or at least accumulated in their present position by some violent action, the name of diluvium was given to it by the earlier geologists. In the northern hemisphere the drift is found alike in Europe, Asia, and America, extending from the polar regions toward the equator, and disappearing on the continent of North America about lat. 38°; while in Europe all traces of it are said to be lost in the countries bordering on the Mediterranean. In South America it is recognized from Cape Horn northward into southern Chili, and according to some observers much further. The assertion that great deposits of such material occur even in tropical Brazil is denied by the more recent observers. This drifted or diluvial material is divided into diluvium proper, or unstratified drift, and stratified or modified drift, which is the result of a rearrangement of the former by water. Unstratified drift is met with at considerable elevations over the present sea level—3,000 ft. above the Baltic, and at a height of 4,000 ft. in the Grampians of Scotland. It is everywhere characterized by loose masses of rock, more or less rounded, which in many cases have evidently been transported for considerable distances from their parent beds. As already described in the article **BOWLDER**s, they are often of great dimensions, and increase in size as the deposit is traced

toward its source to the northward. In Russia they have thus been identified with ledges more than 800 m. distant toward the north. Bowlders of the same kind of granite, easily recognized, traced from Moscow to St. Petersburg, vary from two or three feet in diameter at the former to as many yards at the latter point. Instances of these phenomena are everywhere to be seen in the northern United States. In southern Wisconsin pieces of native copper were often found in the superficial deposits long before the mines of this metal were discovered on the S. shore of Lake Superior, 300 m. to the north. The N. shores of Long Island are strewn with bowlders of red sandstone, and of granite and other primary rocks, arranged in groups which correspond with the position of the ledges of the same rocks in Connecticut. So on the European continent, the stratified rocks of which the whole region on the S. side of the gulf of Finland is composed are covered with granitic bowlders from the primary region of Scandinavia on the other side of the gulf. These bowlders, or erratic blocks, are in some places the only evidences of diluvial action, and are found resting directly upon the solid rocks; but in such cases they have been left in this position by the subsequent washing away of the finer portion of the original diluvium or unstratified drift, in which they were included. This may be described as a heterogeneous mass of clay with sand and gravel in varying proportions, enclosing the transported fragments of rock, of all dimensions, partially rounded or worn into wedge-shaped forms, and generally with surfaces furrowed or scratched, the whole material looking as if it had been scraped together. Such is the unstratified diluvium, or bowlder clay, as it is sometimes called; while in allusion to its supposed accumulation by the agency of ice, it is often designated glacial drift. The rocks beneath this deposit are worn smooth or polished, and more or less deeply grooved or striated in a manner which shows unmistakably that the drift has been made to move over the surface with great force, grinding, planing, and scoring the rocks beneath. Resting on this deposit are generally found accumulations of stratified clays and sands, evidently arranged by deposition from water, which are known as stratified drift, or modified drift.—The characters, relations, and distribution of these various products of diluvial action in North America have been studied with great care by Newberry and by Dawson. The latter has recently published a valuable summary under the title of "The Post-pliocene Geology of Canada." Nowhere are the phenomena of this geological period better seen than in the valley of the St. Lawrence and its tributaries. Dawson divides the deposits of this drift formation into three parts: the first, or lowest, the so-called bowlder clay; the second, or leda clay, a fine deposit in deep waters; and the third, or saxicava sand, an accumulation of shallow-water sand

and gravels. These three deposits in the valley of the St. Lawrence can often be seen in actual superposition, and the order is invariable. In some places all contain marine shells; in others these are limited to the upper part of the leda clay or the lower part of the saxicava sand. In many parts of its distribution the boulder clay holds the remains of marine animals, stones with adhering barnacles and bryozoa being imbedded therein; and elsewhere, according to Dawson, it exhibits other but not less unequivocal evidences of a submarine origin. The true boulder clay is spread out over the region under consideration as a somewhat widely extended and uniform sheet; yet it may be said to fill up all small valleys and depressions, and to be thin or absent on ridges or rising grounds. The boulders which it contains are by no means uniformly dispersed. When cut through by rivers or denuded by the action of the sea, ridges of boulders are often seen to be enclosed within it. It is to be observed, according to the same writer, that although boulders with layers of stones occasionally occur in the leda clay, and the upper sands and gravels sometimes contain large boulders, such deposits are readily distinguished from the true boulder clay. Although generally resting directly on striated rock surfaces, it is sometimes underlaid by rolled gravel or by peat. It is usually destitute of stratification, but horizontal lines, indicating differences in texture and in color, can sometimes be seen, and it occasionally exhibits surfaces on which lie large boulders, striated and polished on their upper sides, forming a sort of pavement. The rocks underneath this boulder clay are very generally polished and striated in a manner similar to those seen beneath Alpine glaciers. The grooves in the region under consideration belong to two series, one evidently produced by a force moving to the southeast, and the other to the southwest. The southwest set prevails in the valley of the St. Lawrence, in western New York, and around Lakes Huron, Superior, and Michigan. Nearly at right angles is another set, directed to the southeast, found to the north of Lake Ontario, in the valleys of the Ottawa and Lake Champlain, and in the highlands of eastern Canada and New England. These, according to Hitchcock, are seen in Vermont at a height of 4,800 ft. above the sea. In some localities the two sets of striæ are found in the same region, and even intersecting one another. Resting upon the boulder clay, and apparently made up from the rearrangement of its finer portions, we find the leda clay of Dawson, so called from the abundance of the shells of *leda truncata* which it contains. It is the Champlain clay of Dana. In many parts it also abounds in other shells, in *foraminifera*, and in some localities in the remains of fishes; its fauna being, alike in Canada and New England, of a somewhat arctic type, and identical with that of the gulf of St. Lawrence

at the present time. Resting upon this clay is found in many localities a stratified sand in which abound the shells of *saxicava rugosa*. In some cases the passage from the one into the other is gradual, while in others there seems to have been an interval marked by the denudation of the underlying clay. In some localities, however, this sand rests on the boulder clay, and where this is wanting, directly on the rock, which in this case is often striated, and was probably once covered by the boulder clay, which was afterward swept away. These stratified fossiliferous clays are found at heights of 500 and even 800 ft. above the present level of the sea in eastern North America. Ridges, terraces, and inland sea cliffs are also noticed over the region characterized by the deposits already mentioned, and are evidently closely connected with the rearrangement of the drift materials, and with the slow movement of elevation from the sea in which these stratified materials were deposited. The origin of the unstratified drift is, however, a question which has been much controverted; the point in dispute being whether this deposit has been accumulated by the action of icebergs under the sea, in the waters of which the stratified deposits were subsequently arranged, or whether it was the result of the action of land glaciers at a time prior to the depression of the region beneath the sea level. The iceberg theory was perhaps first formulated by Peter Dobson of Vernon, Conn., in a note in the "American Journal of Science and Arts" (vol. x., 1826), where he describes the scratched appearance of the boulders scattered over New England as if due to "their having been dragged over rocks and gravelly earth in one steady position," and adds: "I think we cannot account for these appearances unless we call in the aid of ice as well as water, and that they have been worn by being suspended and carried in ice over rocks and earth under water." The transportation of masses of rock by icebergs as they drift along the currents which set from the polar regions, and the distribution of their loads over the bottom of the ocean as the bergs melt away, present, in the view of many, a repetition of the process by which in remote times the surfaces of the present continents were covered with the drift materials. Lyell supposes that the lands, with their present irregularities of surface already defined, were slowly submerged, while islands of floating ice passed along in the polar currents, grounding on the coast and on shoals, and pushing forward the loose sand and gravel spread over the bottom. Thus abraded down to the solid rock, and the surface of this grooved and striated, the shoals, by continued subsidence, passed down to great depths, where the loose materials gathering upon them were no longer disturbed. Finally he supposes the direction of the movement to have been reversed, and the bottom of the ocean to have been again raised to form dry

land; and that during its reëmergence the arrangement of the materials which cover it was modified by exposure to the distributing and stratifying action of the waves, tides, and currents. The extent and immense number of modern icebergs seem to prove their capacity to reproduce upon the shoals and over the bottom of the Atlantic nearly all the phenomena of the drift formation. Measured as they are by miles in length, and rising at times more than 300 ft. in height, with only one fifth of their bulk then visible, they may well float off and distribute along their track the largest boulders which they have abstracted from the rocky cliffs down which they moved as glaciers into the sea. Of late years, however, the theory of Agassiz, that the phenomena of the drift are due not to the submarine action of floating ice, but to terrestrial glaciers, has found much favor. The vast accumulations of ice which have been so well studied in the Alps are seen in their slow and irresistible motion down the valleys to score and groove the surfaces of the rocks over which they pass, rending masses of rock from the cliffs, moving the fragments forward, and finally leaving them rolled in the shape of boulders, and grooved and scratched by the rubbing to which they were subjected when fixed in the ice. In the Alpine regions of Europe the effects thus produced are so remarkable, and spread over such extensive districts, that many geologists who have studied them are disposed to refer all the phenomena of the unstratified drift to the action of glaciers; and in this view they are confirmed by finding unmistakable evidence that the action of the glaciers formerly extended far beyond their present limits. But the unstratified drift is found to extend over vast regions where it is difficult to conceive that mountain glaciers could ever have found their way; and Agassiz, to account for this universal glaciation of circumpolar regions, has been led to maintain the existence of a great continental glacier, or ice cap, extending over the arctic and a great part of the temperate zone, moving downward from the polar region, and of such immense thickness as to surround and overflow the summits of our highest hills, which he supposes may have required in eastern North America a vertical thickness of two or three miles of solid ice. A similar continental glacier, according to this view, must have existed in the southern hemisphere. Prof. Dana, while adopting this notion of the origin of the glacial drift, regards the hypothesis of a central and common glacier source for each hemisphere as untenable, but supposes the existence of distinct glaciers of great magnitude. Such a one, according to him, had its origin along the watershed between the St. Lawrence and Hudson bay; but recognizing the necessity of an elevated source to give motion to the glacier, he supposes that this region, which is now not more than 1,500 ft. above the sea, was then raised many thousand feet above its present

level.—In these theories of land glaciation a great depression of the surface is supposed to have succeeded the glacial period, affecting in the one case the great mountain plateau to the northward, and submerging the glaciated region so as to permit the deposition above its surface of the stratified clays and sands which overlies the boulder clay. But, as we have seen, this in many parts of its distribution is clearly of marine origin; and a careful study of the whole of the phenomena of the drift period in eastern North America has led Dawson to regard the operation of land glaciers in this region as of very limited extent and importance, and to maintain that the widespread glacial drift is essentially submarine in its origin. This earlier view, which as set forth by Lyell has been partially explained above, endeavors to account for the phenomena in question by causes now in operation, rather than by supposing a condition of things which it is at once difficult to conceive and to explain. As expounded by Dawson, it maintains that at the beginning of the glacial time eastern North America was already under water, and was slowly rising, though with minor oscillations of level, from the ocean, the more western portion first. Along the eastern border of the rising land, over its still submerged plains, and through its valleys, then flowed the arctic current, as it now does along the coast of Labrador and the shores of Newfoundland, bearing great quantities of floating ice, by the action of which, combined with the current, the rocky strata were eroded, and the valleys and lake basins excavated. At an early period in this order of things, the great arctic stream, pursuing, in obedience to the force impressed upon it by the earth's rotation, a southwestern course, passed over the region of the great lakes and excavated their basins; while at a later time, diverted further eastward by the emergence of the Laurentides, it would pass along the present St. Lawrence valley, and thence southwestward to the Mississippi. To quote the language of Dawson: "The prominent southwestern striation, and the cutting of the upper lakes, demanded an outlet to the west for the arctic current. But both during the depression and the elevation of the land there must have been a time when this outlet was obstructed, and when the lower levels of New York, New England, and Canada were still under water. Then the valley of the Ottawa, that of the Mohawk, and the low countries between Lakes Ontario and Huron, and the valleys of Lake Champlain and the Connecticut, would be straits or arms of the sea; and the current, with its icebergs, obstructed in its direct flow, would set principally among these, and act on the rocks in north and south and northwest and southeast directions. To this portion of the process I would attribute the northwest and southeast striation." As the process of elevation proceeded, and the northern current found its passage across the east-

ern region to the sea, by channels further and further east, the conditions became such as to permit the deposition, from seas comparatively undisturbed, of the stratified clays and sands, which are seen in so many cases to rest upon the boulder clay, and are found with their characteristic fossils at elevations of 500 and even 800 ft. above the sea; while others, though so far as known without organic remains, are met with at still higher levels. But portions of floating ice still dropped from time to time the rock masses with which they were freighted, in the midst of these stratified clays. Nor are evidences wanting in the lower St. Lawrence that a second invasion of icebergs may have given rise to new accumulations of boulder drift after the deposition of the stratified clays. The valleys among the hills, and the shores of the islands, which then rose above an icy sea, would be filled with the local glaciers, of which the traces still remain, which gave their tribute to the northern current, already charged as now with immense icebergs from the polar regions. These in great part submerged and half stranded masses, urged by current, wind, and tide, would plough and furrow the bottom, there piling up the unstratified heaps of boulder clay, to which the earth and rocks borne by the melting ice would contribute.—The formation of the diluvium or boulder drift is thus, according to either view, the result of the action of ice. But the glacial action, in the opinion of the land-glacialists, was limited to a definite period, and operated simultaneously over a vast area, which, according to one hypothesis, was not less than an entire hemisphere. Those, on the other hand, who restrict the action of land ice to local glaciers, and call in the aid of floating ice and the arctic current, maintain that the process of glaciation is limited rather by place than by time. Ever since the conditions of the earth have been such as to give rise to the formation of polar ice, the shores and the shallow seas to which the arctic current has borne it must have been subject to glacial action such as we have endeavored to describe. From the days in which the glaciation of our valleys and the deposition in them of the glacial drift took place, this process has not ceased, but has been transferred to other regions; and we may suppose that the banks of Newfoundland, if now raised above the ocean's level, would present striations and glacial drift, which, but for the presence of remains showing its formation to have been in the historic period, would be indistinguishable from the ancient boulder clays of New England and Canada.

DIME (Fr. *dime*, contraction of *dixième*, a tenth), a silver coin of the United States, of the value of 10 cents, or $\frac{1}{10}$ of a dollar. It was first coined in 1796, in pursuance of the act of April 2, 1792, in which year pattern pieces were struck. Its legal standards have been as follows: by act of April 2, 1792, fineness 892.4 thousandths, weight 41.6 grains; by act of

Jan. 18, 1837, fineness 900 thousandths, weight 41.4 grains; by act of Feb. 21, 1853, fineness 900 thousandths, weight 38.4 grains. The half dime, of proportional weight and like fineness, was authorized by the same acts. These coins, which previous to Feb. 21, 1853, had been a legal tender for any amount, were by the act of that date made a legal tender only for sums not exceeding \$5. By the act of Feb. 12, 1873, the half dime was discontinued, and the weight of the dime was fixed at 38.58 grains, or one fifth that of the half dollar. The number of pieces coined to June 30, 1873, was: dimes 89,854,925, half dimes 97,547,938; total, 187,402,863; value, \$13,862,889 40.

DIMSDALE, Thomas, an English physician, born at Thoydon-Garnon, Essex, in 1712, died in Hertford, Dec. 30, 1800. He was noted for his zeal in promoting inoculation for the small-pox, and was invited to Russia by Catharine II. in 1768, for the purpose of inoculating herself and her son. He afterward visited Frederick II. of Prussia at Sans-Souci, and then returned to England, where in 1776 he published a treatise on inoculation, which was translated into all the European languages. In 1780 he was elected to the house of commons, and in 1781 made a second professional visit to Russia. He also published several pamphlets on inoculation.

DINAGEPOOR, a town of Bengal, India, capital of a district of the same name, in lat. 25° 34' N., lon. 88° 45' E., 210 m. N. of Calcutta; pop. about 30,000. The town has a large square in the centre surrounded with shops, but there are no public buildings of any consequence, although it is the seat of the British judicial and revenue courts. There are no temples and but one mosque, which is small and without architectural pretensions. The dwellings of the Europeans are large and commodious, but exhibit no taste, while those of the natives are mere huts. The trade of the place is inconsiderable.

DINAN, a town of Brittany, France, in the department of Côtes-du-Nord, on the Rance, 30 m. N. W. of Rennes; pop. in 1866, 8,510. It occupies a commanding and romantic site on the crown and slopes of a steep hill overlooking the narrow valley of the Rance, which flows 250 ft. below its summit. It is surrounded by a high wall, pierced by four gates, which anciently had 54 round towers, but has now but 16. The old and picturesque castle, built about 1300, is now a prison. On the outside of the walls, now overgrown with ivy, are beautiful terraces and gardens in the former moat. There are some fine specimens both of ancient and modern architecture. In one of the four open places is a statue of Dn Guesclin, who successfully defended the town against the English in 1359. Its port can admit vessels of 90 tons burthen, and it has a considerable coasting trade. Its manufactures consist chiefly of linen, cotton, and woollen goods, leather, beet-root sugar, and salt. In the en-

Dinant.

viros are chalybeate springs, much resorted to. It was often besieged in the middle ages.

DINANT, a town of Belgium, on the Meuse, 14 m. S. of Namur; pop. about 7,000. It is situated at the base of limestone cliffs, on the summit of which are a citadel and a chapel. The cliffs are accessible by winding stairs cut in the rock from terrace to terrace nearly up to the walls of the fortress. The town has only one narrow street, with a small market place. In the vicinity are quarries of black marble; and there are some manufactures. Dinant cakes, made of honey and rye flour, are famous. Brass and copper ware are called from this place *dinanderies*. Dinant was sacked in 1466 by Philip the Good of Burgundy, in his warfare against Louis XI., and again in 1554 by the duke of Nevers, who served under Henry II. against Charles V.; and it was captured by the French in 1675.

DINAPORE, a town of Bengal, India, on the S. bank of the Ganges, 10 m. N. W. of Patna and 300 N. W. of Calcutta; pop. about 16,000. It is an important military station, noted for its handsome and extensive cantonments, capable of containing 5,000 troops. Around the station are a great number of fine bungalows with small parks and gardens. The town, a confused assemblage of thatched huts and brick buildings seldom more than one story high, extends about a mile along the banks of the river. The native troops at Dinapore mutinied and gave much trouble in 1857.

DINDORF, Wilhelm, a German philologist, born in Leipsic, Jan. 21, 1802. His father was professor of oriental languages at the university in his native city, which he entered in 1817, and where he continued, when not more than 17 years old, the commentary and scholia on Aristophanes begun by Beck. He published subsequently a new edition of the Greek author (Leipsic, 1820-'28), and received in 1828

a professorship of the history of literature at Leipsic. He began his lectures in 1830, but resigned the chair in 1833 in order to devote himself entirely to classical labors. He went to Paris, and edited there, in conjunction with his brother and Hase, Stephens's *Thesaurus Græcæ Linguae* (1829-'63). He is one of the principal editors of Didot's *Bibliothèque des classiques grecs*, and of the Oxford and Teubner's (Leipsic) editions of Greek classics. — His brother

LUDWIG, born Jan. 3,

1805, is specially known as the editor of the writings of Xenophon, Diodorus Siculus, Pausanias, and of the chronography of Joannes Malalas.

DINGELSTEDT, Franz, a German poet and novelist, born at Halsdorf, in Hesse, June 30, 1814. Having studied theology and philology, and served as a professor at Cassel and Fulda, he became in 1850 intendant of the royal theatre at Munich, and in 1867 director of the royal opera house in Vienna. He has published collections of poems entitled *Lieder eines kosmopolitischen Nachtwächters* (1840), *Gedichte* (1845), and *Nacht und Morgen* (1851), and a number of romances, dramas, and books of travel. In 1840 he married Jenny Lutzer, a celebrated singer.

DINGO. See Dog.

DINKELSBUHL, a town of Bavaria, on the right bank of the Wernitz, 44 m. S. W. of Nuremberg; pop. in 1871, 5,213. It has several fine churches, an orphan asylum, and two hospitals. It suffered heavily during the thirty years' war, and is still declining; but it has considerable manufactures of woollen hosiery, linen, paper, hats, and stone slabs for tables, besides dyeworks, a brewery, and several mills. It was formerly a free city, but came into the possession of Bavaria in 1802. It is on three hills, and its ancient walls are still standing.

DINORNIS (Gr. *δεινός*, terrible, and *ὄρνις*, bird), a gigantic extinct bird, whose bones have been found in New Zealand. The history of this genus, established by Owen, is one of the most remarkable examples of the correctness of the great laws of the correlation of parts so beautifully elaborated by Cuvier. In vol. iii. of the "Transactions of the Zoölogical Society of London" is the first paper by Owen on this subject. He had received from New Zealand a fragment of a femur, six inches long, with both the extremities broken; from its tex-

ture and size he concluded that it belonged to a bird of the struthious order, but heavier and more sluggish than the ostrich; the bone was not mineralized, and retained much of its animal matter, though it had evidently remained in the ground for some time; this was in 1839. In a second memoir, communicated in 1843, he gives descriptions of portions of the skeletons of six species of a struthious bird, named by him *dinornis*, which appeared to have become extinct within the historical period in the North island of New Zealand, as the dodo had in Mauritius. These specimens, 47 in number, had been sent to Dr. Buckland by the Rev. Mr. Williams, a missionary, who wrote that they were taken from the banks and bed of fresh-water rivers, buried only slightly in the mud, and probably quite recently; that the birds formerly existed in considerable numbers, and must have attained during a very long life a height of 14 or 16 ft. The bird to which

Dinornis giganteus.

these bones belonged was called *moa* by the natives. The names given by Owen were *dinornis giganteus*, height at least 10 ft.; *D. ingens*, 9 ft.; *D. struthioides*, 7 ft.; *D. dromioides*, 5 ft.; *D. didiformis*, 4 ft.; and *D. otidiformis*, of the size of the great bustard. From these specimens he inferred that the wings were quite rudimentary; that the large cervical vertebrae supported a powerful beak; and that its strong legs were used in scratching up the soil to obtain the nutritious roots of the ferns which are so characteristic of those islands. He draws a portrait of this gigantic bird, the highest living form in that part of the globe, with no terrestrial mammal to contest its possession of the soil before the arrival of the first Polynesian colony. In a third memoir, read in 1846, an examination of a larger number of specimens confirmed the deduction as to the rudimentary condition of the wings by the discovery of a keelless sternum; showed that the species of this essentially terrestrial genus were

heavier and more bulky in proportion to their height, more powerful scratchers, and less swift of foot than the ostrich, but in different degrees according to the species; and indicated an affinity to the dodo in the shape of the skull, with a lower cerebral development, and consequently greater stupidity. He formed a new genus, *palapteryx*, of the species *ingens* and *dromioides*, characterized by a posterior or fourth toe, the three of the *dinornis* all being anterior toes; he added the three new species, *D. crassus*, *D. casuarinus*, and *D. curtus*, all of small size. In a fourth paper, read in 1848, he establishes a new genus, *aptornis*, in which he places what he formerly called *D. otidiformis*; this has a large surface for the hind toe, a strong perforated calcaneal process, and a more posterior position of the condyle for the inner toe; it resembles the apteryx in the comparative shortness of the metatarsus. In this he describes perfect skulls and beaks of these birds, from which he concludes that the *dinornis*, though resembling the *struthionidae* in the extraordinary development of the legs and the rudimentary condition of the wings, does not come very close to any existing struthious birds in its adze-like beak, crocodilian cranium, form of the pelvis, and proportions of the metatarsus. The genus *palapteryx* belongs to the *struthionidae*, being in some respects intermediate between *apteryx* and *dromaius*. The law of the localization of animals, so remarkably illustrated in the recent progress of geology, receives an additional confirmation by this occurrence in the river banks of New Zealand of remains of gigantic birds allied to the small species (the *apteryx*) still existing only in the same islands. In vol. iv. of the "Transactions," in 1850, the feet and sternum are described, and two new species are alluded to, *D. rheides* and *P. robustus*; further descriptions of the skull, beak, and legs are given in the same volume. Some years before the discovery of these bones in New Zealand, attention had been drawn to remarkable impressions in the new red sandstone of the Connecticut river valley, in Massachusetts, which were believed to be footprints of birds, the largest of which must have exceeded the ostrich in size. Geologists were unwilling to admit the existence of birds at this remote epoch, or of such large ones at any time; but the subsequent discovery of *D. giganteus* demonstrated the existence of birds, at a comparatively recent period, whose tracks would have been 22 in. long and 6 wide, considerably larger than those of the Connecticut valley. The occurrence of these gigantic birds in New Zealand adds much to the evidence that similar apterous and low-organized reptilian birds existed in America during the red sandstone epoch, "the age of reptiles," when the cold-blooded and slow-breathing *oripara* exhibited such various forms and so great a number of species. Though many of these bones are apparently recent, and though it is not impossible, in the opinion of some, that the *dinornis*,

like the apteryx, may still exist in the interior of these islands, they belong to a certain extent to the class of extinct genera. In a more recent paper in the "Proceedings of the Zoological Society," for April 8, 1856, Prof. Owen describes the *D. elephantopus*, the most extraordinary of all for the massive strength of the limbs and the general proportions of the breadth and bulk to the height; and it is the opinion of Mantell that this species existed in the Middle island with the first Maori natives. From a consideration of these species, it appears that those of the North island were distinct from those of the South.

DINOSAURIANS, a tribe of fossil saurians, of immense size, having many mammalian characters, such as a medullary cavity in the long bones, short, pachyderm-like feet, a sacrum of five united vertebrae, and a lateral motion of the lower jaw. They include the iguanodon, megalosaurus, &c., herbivorous and carnivorous; they are of the mesozoic age, from the middle of the Jurassic to the middle of the cretaceous epochs.

DINOTHEERIUM (Gr. *δεινός*, terrible, and *θηρίον*, beast), an extinct pachyderm of immense size, some of whose bones have been found in the middle tertiary or miocene deposits of Europe, Asia, and Australia. A few teeth were found in France during the last century and the early part of the present. In 1829 Kaup discovered at Eppelsheim, S. of Mentz, a sufficient number of bones to lead him to form a new genus for it. In 1836 the discovery of a cranium by Klipstein seemed to settle the position of the dinotherium among the pachyderms. This head (of which casts are very generally found in cabinets) is nearly 4 ft. long, 2 ft. broad, and 1½ ft. high, its summit divided into two parts by a well marked ridge, and its occipital surface wide and oblique, with a globular occipital condyle; the nasal aperture is very large, as in the elephant and mastodon, with the large suborbital foramina indicating the possession of a proboscis. The lower jaw is remarkable for its curve downward, and its two tusks pointing in the same direction, forming a hook 3 ft. in length and describing a quarter of a circle. The primary teeth appear to have been 12, 3 on each side of each jaw, and the permanent teeth 20, 5 on each side of each jaw; the front 2 on each side, making 8, are premolars, and resemble those of the tapir; the upper 12 teeth, the true molars, resemble those of the mastodon in their transverse ridges, but differ from them in their square form; they are developed vertically, as in man and most mammals, while those of the elephant family are developed horizontally. If the bones of the trunk and extremities attributed to this animal really belong to it, it would have a length of 18 ft. and a height of 14, 2 ft. longer and higher than the largest mastodon discovered. The shoulder blade is like that of the mole, indicating that the fore feet were adapted for digging. It is not very easy to de-

cide whether this animal was more terrestrial or aquatic in its habits. Pictet expresses the opinion that it was a herbivorous cetacean. On the contrary, Owen, Kaup, and De Blainville

Dinotherium giganteum.

consider it a terrestrial proboscidian, intermediate between the mastodon and tapir. These two opinions are really not very different, since it is now generally agreed that the manati and dugong, or the herbivorous cetacea, must be removed from the order of cetaceans and placed among the pachyderms, of which last they are the embryonic type. Considering then the dinotherium to be a true pachyderm, or perhaps a connecting link between this order and the herbivorous cetaceans, its favorite element, air or water, may be a matter of question. It has no incisor teeth; its inferior tusks seem admirably adapted to drawing its heavy body out of water upon the banks of rivers, and would also serve for rooting up aquatic plants, assisted by the mole-shaped fore feet. Buckland suggests that the tusks served to anchor the animal to the shore, while it slept in the water. It cannot be far from the truth to call it an aquatic pachyderm, similar in habits to the hippopotamus. The best known species (*D. giganteum*, Kaup) was found at Eppelsheim, in clayey marl about 18 ft. below the surface, in connection with bones of other pachyderms; their remains have been found only in the miocene strata. Other smaller species are described, as the *D. Cuvieri* (Kaup), *D. minutum* (H. de Meyer), and *D. proavum* (Eichwald), in Europe; *D. Indicum* (Cautley and Falconer), from the Sivalik hills; and the *D. australe* (Owen), of Australia.

DINWIDDIE, a S. E. county of Virginia, bounded N. by the Appomattox river, and S. W. by the Nottoway; area, 540 sq. m.; pop. in 1870, 30,702, of whom 17,664 were colored. It has a rolling surface and a soil well adapted to grain and tobacco. The Atlantic, Mississippi, and Ohio, and the Petersburg and Weldon railroads traverse it. The chief productions in 1870 were 39,869 bushels of wheat, 170,712 of Indian corn, 57,079 of oats, 1,232 tons of hay, and 844,504 lbs. of tobacco. There

were 993 horses, 1,626 milch cows, 1,861 other cattle, and 5,127 swine; 6 flour mills, 3 saw mills, 1 distillery, 17 manufactories of tobacco, 2 of agricultural implements, 8 of carriages and wagons, 4 of cotton goods, 1 of fertilizers, 2 of iron castings, 3 of machinery, and 1 of paper. The largest town is Petersburg. Capital, Dinwiddie Court House.

DINWIDDIE, Robert, lieutenant governor of Virginia, born in Scotland about 1690, died at Clifton, England, Aug. 1, 1770. While acting as clerk to a collector of the customs in the British West Indies, he was instrumental in detecting frauds practised by his principal, and as a reward was soon after appointed lieutenant governor of Virginia. He arrived in the colony in 1752, and remained until January, 1758, when he returned to England. Although totally ignorant of military affairs, he discerned the capacity of Washington, whom in 1753 he appointed adjutant general of one of the four military districts of Virginia, and sent as a commissioner to expostulate with the French commander on the Ohio for his aggressions upon British territory. At the outbreak of hostilities with the French and Indians, he called upon the governors of the other provinces to make common cause against them, and convened the house of burgesses of Virginia. Entertaining peculiar notions of the royal prerogative and of his own importance, he was highly incensed at the tardiness of the latter body in voting money for the public defence, and at their refusal to put it under his absolute disposal. In 1754 he suggested to the British board of trade the propriety of taxing the colonies for the purpose of raising funds to carry on the war, and in the succeeding year he was one of the five colonial governors who memorialized the ministry to the same effect. After the defeat of Braddock he continued to busy himself with the military operations on the frontiers, displaying great incapacity, and wearying Washington, then in command of the colonial troops, by frequent exhibitions of ill temper, folly, or caprice. He enjoyed little popularity, and his arrogance brought him into collision with the legislature, while his avarice led him to exact illegal or obsolete fees. At the time of his departure he was charged with having appropriated to his own use £20,000 of public money, which he never satisfactorily accounted for.

DIOCESE (Gr. *διοίκησις*, administration), in ancient times, an administrative division of the Roman empire, forming a subdivision of one of the four prefectures, and comprising several provinces; in modern language, the territory governed by a bishop. As early as the time of Cicero we find mention of the *dioceses*, or districts, of Asia Minor. Subsequent to the reorganizations of the empire under Diocletian and Constantine the Great, the dioceses were the East, Egypt, Asia, Pontus, Thrace, Macedonia, Dacia, Illyria, Italy, Africa, Gaul, Spain, and Britain. The East was governed by a count,

Egypt by a prefect, some by proconsuls, and others by vicars. Each province was subdivided into cities (*civitates*), subject to a supreme magistrate residing in the chief city or *metropolis*. When the gospel began to be preached, each city among the Greeks and Latins was governed by magistrates chosen from among the citizens, and sometimes designated as *βουλή*, senate, sometimes as *ordo* or *curia*. Over this governing body presided a superior magistrate called *dictator* or *defensor* of the city. His authority, and that of his brother magistrates, extended over the adjacent territory, made up generally of a number of towns and villages. The first administration of the church was moulded on this civil division. In each *civitas*, or city, with its suburban territory, there was established a corresponding ecclesiastical magistracy, namely, a presiding officer (*episcopus*, bishop), with a senate of priests (*presbyterium*); and his spiritual jurisdiction extended as far as the civil jurisdiction of the city, its circle being called at first *παροικία*, parish, but from the beginning of the 4th century diocese. As each city of the empire had in the towns (*oppida*) of its jurisdiction magistrates subordinate to those of the city itself, so the church in each city came to have ministers subordinate to the bishop in these towns; hence the origin of parishes and parish priests. In like manner the capital city of each province came to have its ecclesiastical metropolitan, who had jurisdiction and superintendence in things spiritual over the bishops of the province. And in some respects corresponding with the office of vicar or *praefectus praetorio* in each civil diocese of the empire, there arose the dignity of patriarch or exarch in the church, whose pre-eminence extended over a number of ecclesiastical provinces. At present, in the Roman Catholic and Greek churches, the word diocese means "the territory attached to each see," whether patriarchal, primatial, metropolitan, or episcopal. Thus, the pope is bishop of the diocese of Rome; the patriarch of Lisbon, of the city of that name and its ecclesiastical territory, forming the diocese of Lisbon; the archbishop of New York, of the city of New York and that portion of the state forming together the archdiocese. In the Protestant Episcopal churches, a diocese is the district ruled by a bishop. In the Evangelical church of Germany, a diocese is a combination of parishes under the care of a superintendent.

DIOCLETIAN (DIOCLETIANUS VALERIUS), a Roman emperor, born near Salona in Dalmatia, A. D. 245, died in that town in 313. From his mother, who was called Doclea or Dioclea, from the village in which she lived, he derived the name Docles or Diocles, which he changed on assuming imperial authority to Diocletianus, taking at the same time the patrician name of Valerius. His parents were of the humblest class; but his abilities secured his rapid promotion in the army, which he entered at an early age, and his personal pop-

ularity with the troops gave him the greatest influence. He held important positions under Probus and Aurelian, and served under Carus in the expedition against Persia, which was suddenly terminated by that emperor's death in his camp on the banks of the Tigris, in 284. When, during the retreat that followed, Numerian, the son of Carus, was assassinated, the soldiers unanimously chose Diocletian as his successor. But he was obliged to contest his position with Carinus, brother of Numerian, who was recognized as emperor in Europe. The armies of the hostile sovereigns met near Margum, not far from the Danube in Mœsia, where the battle itself was decided against Diocletian; but Carinus, eagerly following the flying enemy, was killed by one of his own officers, and his army readily acknowledged Diocletian as his successor. He was installed as emperor with great ceremony at Nicomedia. But affairs were still in the greatest confusion, and he determined to associate with himself a colleague in the supreme dominion, and fixed his choice on Maximian, his old companion in arms, a rough barbarian, whom he invested with the imperial dignity in 286, and in whom he found a useful assistant and a constant friend. The Roman empire was beset with enemies and torn by factions. The peasants of Gaul rose in arms; Mauritania was in rebellion; Egypt was disturbed by external enemies and internal convulsions; while all along the frontier, from the Euphrates to the Rhine, the barbarians were threatening to destroy the empire by their invasions. Maximian subdued the Bagaudæ or Gallic peasants, but Diocletian determined to strengthen the empire by raising two more Roman soldiers to the purple, Galerius, son of a Dacian shepherd, and Constantius, surnamed Chlorus, son of a noble Mœsian, and father of Constantine the Great. These two princes in 292 received the title of Cæsar, and having repudiated their wives, Galerius married the daughter of Diocletian, and Constantius the stepdaughter of Maximian. Britain, Gaul, and Spain were assigned to Constantius; Galerius received the Illyrian and Danubian provinces; Italy and Africa, with Sicily and the islands of the Tyrrhenian sea, were held by Maximian; while Diocletian, the head of all, retained under his own dominion Thrace, Egypt, and the provinces of Asia, and established his capital at Nicomedia. By this arrangement, on the death of either of the Augusti, as Maximian and Diocletian were styled, the Cæsar who had been associated with him was to be his successor, and another Cæsar was to be appointed. These four princes, it was thought, would hold one another in check, so that no one of them would be able to attain to uncontrolled power. The plan was for a time successful. Maximian subdued the rebellious provinces of western Africa; Diocletian reduced and secured Egypt; Galerius not only, under the superintendence of his father-in-law, compelled the Persians to make

a treaty which secured the frontiers of that part of the empire for 40 years, but also vigilantly guarded the Danubian frontier; while Constantius invaded Britain, which for several years had been detached from the rest of the empire under the rule of Carausius, and restored that island to the control of the Roman emperors. After a prosperous reign of about 21 years, Diocletian, moved by his infirm health, or, as some writers have said, by the persuasions or menaces of his son-in-law Galerius, voluntarily resigned the throne in 305, and retired to Salona in his native country, where he passed the remaining eight years of his life in retirement. Maximian, according to a previous agreement, abdicated at the same time, but was not contented in a private station, and a few years later wrote to his former colleague, proposing to him to resume the reins of government. The reply of Diocletian has become celebrated. "Would you could see," he said, "the cabbages planted by my hand at Salona; you would then never think of urging such an attempt."—Diocletian struck a severe blow at the waning influence of the senate by the removal of his court from Rome to Nicomedia, reduced the numbers and the importance of the prætorian guards, divided the provinces so as to lessen the power of the provincial governors, and increased the dignity and ceremony with which the emperor was surrounded. He is censured for permitting the persecution of the Christians; but it must be remembered that the greater part of these persecutions took place after Diocletian had resigned his authority. The history of the reign of Diocletian is exceedingly confused, and only the principal events given above can be assumed to be accurate. Authorities differ widely in their account of many of the details. The year 284, the period of Diocletian's accession, was made by the ecclesiastical writers the beginning of an era called "the era of Diocletian;" a chronological form often employed in early theological works.

DIODATI, Domenico, an Italian archæologist and theologian, born in Naples in 1736, died there in 1801. He wrote several works on ecclesiastical history, and one on the coins of the Italian states; but that by which he became widely known is entitled *De Christo Græce loquente Exercitatio* (Naples, 1767). The theory that Greek was the native language of the Jewish people in the time of Christ is advocated in this work with remarkable subtlety, nice comparison of passages, and a great variety of proofs, both external and internal. The academy della Crusca made him at once one of its associate members, and the empress of Russia sent him a gold medal for his service to the language of the sacred records.

DIODATI, Giovanni, a Swiss theologian, born in Geneva in 1576, died there in 1649. His parents, natives of Lucca, had taken refuge in Switzerland from the persecution directed against them on account of their Protestant-

ism. At 21 years he became, on the nomination of Beza, a professor of Hebrew. In 1608 he was made parish minister in the Reformed church, and in 1609 became professor of theology. In 1618-'19 Diodati, already noted as a preacher both in France and Switzerland, attended the synod of Dort, where with Theodore Tronchin he represented the church of Geneva, and was one of the six ministers appointed to draw up the articles of faith. In this synod he showed himself a zealous Calvinist, and offended many by his bitterness against the Remonstrant party. He relinquished his office as professor in 1645, and passed the remaining years of his life in retirement. He built the villa Diodati, near Geneva, where he was visited by Milton, and in which Byron resided in 1816. He was considered by many to be the most learned Biblical scholar of his day. Among his works are an Italian version of the Bible (1603; new eds., with notes, 1607 and 1641); a free Italian translation of the New Testament (1608); *Mortis Meditatio Theologica* (1619); *De Fictitio Pontificiorum Purgatorio* (1619); French translations of Job, Ecclesiastes, and Canticles (1638), of the Psalms (1640), and of the whole Hebrew Bible (1644); also of Fra Paolo's "History of the Council of Trent" (1621); and a great number of other theological and controversial writings.

DIODON. See SEA PORCUPINE.

DIODORUS, commonly called, from the island of his birth, **DIODORUS SICULTUS**, a historian of the time of Cæsar and Augustus, born at Agyrium in Sicily; the precise dates of his birth and death are unknown. He spent 30 years in composing a universal history, and in the preparation of this work he traversed a large portion of Europe and Asia. The first 6 books treated of the times anterior to the Trojan war; the 11 following extended to the death of Alexander the Great; while in the remaining 23 the history was brought down to the time of Julius Cæsar. Of this extensive work, which was styled *Βιβλιοθήκη*, or *Βιβλιοθήκη ἱστορικὴ* (library, or historical library), we have now only 15 books entire, and a few fragments of the rest. The first 5 books, containing the ancient history of the eastern nations, the Ethiopians, Egyptians, and Greeks, and the 10 from the 11th to the 20th inclusive, comprising events from the second Persian war, 480 B. C., down to 302, remain entire. Many fragments of the other books are preserved in the works of Photius, and in the *Eclogæ*, or selections, made by order of the emperor Constantine Porphyrogenitus. The *Bibliotheca* is the only authentic work of Diodorus of which we have any knowledge. It is written in the style of annals, in a confused and discordant manner; but the work is valuable as giving us, if not always information of facts, at least of the opinions of men at a period concerning which our knowledge is so exceedingly meagre that the slightest addi-

tion is of great value. The first 5 books are especially prized on this account. Most of the events treated in the other 10 are better told by Thucydides and Xenophon, who are silent, however, upon the Carthaginian wars in Sicily related by Diodorus. The best modern editions of his works are those of Dindorf (6 vols., Leipsic, 1828; 5 vols., 1867-'8), Müller (Paris, 1842-'4), and Bekker (4 vols., Leipsic, 1853-'4). That portion which relates to the successors of Alexander was translated into English by Thomas Stocker (4to, London, 1569). The whole work was translated by Thomas Cogan (fol., London, 1653), and by G. Booth (fol., London, 1700 or 1721; republished, 2 vols. royal 8vo, London, 1814).

DIOGENES, a Cynic philosopher, born at Sinope, in Paphlagonia, A.s.a Minor, about 412 B. C., died near Corinth in 323. His father was a banker, and was condemned for having adulterated the coinage; and whether his son was involved in the same condemnation or not, it is certain that he left his native country and took refuge in Athens. Here he became a disciple of Antisthenes, the founder of the Cynic school of philosophy. The latter was at first unwilling to receive him, driving him rudely from his door, and threatening him with his staff. "Strike," said Diogenes; "you cannot find a stick so hard as to compel me to go away while you speak that which I wish to hear." Diogenes soon gained a reputation superior to that of his master for rough and caustic wit. It is said that one day at Athens the citizens saw him with a lantern in his hand, although it was broad day, apparently searching for something. On being asked what he was seeking, he replied, "A man." He had found children, he said, in Sparta, and women in Athens, but men he had never seen. He used to carry a small cup, but broke it on seeing a boy drink from the hollow of his hand. He slept either under the portico of some building, or in a tub, which, according to some authors, was his ordinary dwelling, and which he carried about with him. The truth of this, however, has been much disputed by both ancient and modern critics. He taught in the streets and public places, speaking with the utmost plainness, often with rudeness, and was altogether insensible to reproaches and insults. His wit was ready and severe. Plato defined man as a two-legged animal without feathers; whereupon Diogenes, having stripped a fowl of its plumage, threw it among the pupils of the great academician, bidding them behold one of Plato's men. Being asked which is the most dangerous animal, he answered: "Of wild animals, the slanderer; of tame, the flatterer." On a voyage to the island of Ægina he was captured by pirates, and afterward sold as a slave. While in the market place, waiting for a purchaser, being asked what he could do, he answered that he knew how to govern men, and bade the crier ask, "Who wants to buy a master?" He was purchased by Xenias, a

Corinthian, who carried him home, and afterward set him at liberty, intrusting to him the education of his children. The rest of his days Diogenes divided between Athens and Corinth, and it was at the latter place that his celebrated but apocryphal interview with Alexander the Great is said to have taken place. The king of Macedon, surprised at the indifference with which he was regarded by the ragged philosopher, who was comfortably basking in the sun before his tub, said to him, "I am Alexander." "And I," was the reply, "am Diogenes." Alexander desired him to ask a favor; but all that the Cynic wished was, that Alexander would not stand between him and the sun. Struck with this extraordinary insensibility to the usual weaknesses of humanity, the Macedonian remarked, "Were I not Alexander, I would be Diogenes." Diogenes loved to display his contempt of the common courtesies of life. Plato was giving a magnificent dinner to some friends, and Diogenes entered unbidden, and stamping with his dirty feet on the carpets, exclaimed, "Thus I trample on the pride of Plato." "But with greater pride, O Diogenes," replied Plato. Surly, independent, a voluntary outcast, he lived on till his 90th year. According to some authors he wrote several works, but nothing has come down to us except some sayings preserved by Diogenes Laërtius, and it is generally believed that he wrote nothing whatever. He did not teach by lectures, but uttered his philosophy in short, pithy sentences, as occasion offered.

DIOGENES OF APOLLONIA, a Greek philosopher, born at Apollonia in Crete, flourished in the 5th century B. C. Very little is known of his life. He was at Athens probably about 460, and became involved in some trouble there. His philosophical speculations were developed in his work *Περὶ Φύσεως*, "On Nature," which was extant in the 6th century. His great object was to find the first principle of the world, and he came to the conclusion that air of various degrees of condensation formed the atmosphere, fire, water, and earth, and out of these everything else was evolved; and he endowed this first principle with a certain intelligence, presiding over the arrangement of the universe, the marks of which are visible in the order and beauty of creation. The brutes, he says, are inferior to man because they inhale an air less pure, holding their heads near the ground. The world, too, he supposed to be animated, and he imagined the stars to be its organs of respiration. The few fragments of Diogenes which have come down to us (in the works of Aristotle, Diogenes Laërtius, and Simplicius) were published by Panzerbeiter (Leipsic, 1830).

DIOGENES LAËRTIUS, an ancient historian of philosophy, who probably lived about the beginning of the 3d century, though the dates of his birth and death are unknown, and his life has been placed as early as the time of Augustus,

and as late as that of Constantine the Great. He wrote a history of philosophy in Greek, divided into 10 books, and giving an account of the philosophers, anecdotes of their lives, and illustrations of their teachings. He considers Grecian philosophy to have been indigenous, and divides it into two schools: the Ionic, commencing with Anaximander and ending with Clitomachus, Chrysippus, and Theophrastus, and of which the Socratic school forms a part; and the Italian, whose founder is Pythagoras, and whose last master is Epicurus, and which includes Heraclitus, the Eleatics, and the Sceptics. The account of these two schools comprises the whole of the work, with the exception of the first book, which contains the history of the seven wise men of Greece. The work of Diogenes is valuable for information which we could obtain from no other source; but it is ill digested, without critical judgment, and often inaccurate. Diogenes is supposed to have written some other works, among which was a volume of epigrams, but these have been entirely lost. A good edition of his history is that of H. G. Hübner (2 vols. 8vo, Leipsic, 1828-'31). A translation into English was published in 1868 (2 vols. 8vo, London), and there is one by C. D. Yonge in Bohn's "Classical Library."

DIOMEDES. I. One of the most famous of the Grecian heroes at the siege of Troy, and after Achilles considered the bravest of all the Greeks. According to Homer, his father Tydeus was one of the leaders in the expedition of the seven against Thebes, and was killed before the walls of that city, while Diomedes was still a boy. Having arrived at the age of manhood, he joined the second expedition against Thebes, and avenged his father's death. With 80 ships he sailed in the great Grecian armament to the siege of Troy, where, besides many victories over heroes of less note, he put Hector and Æneas to flight, and wounded both Venus and Mars. He was also famed for his wisdom in council, and when Agamemnon proposed to abandon the siege, Diomedes declared that he with his friend Sthenelus would remain until Troy should fall. According to later legends, he carried off with Ulysses the palladium from Troy. Of his history after the fall of the city Homer gives no account, but later writers tell us that having returned to Argos and found his wife unfaithful, he abandoned his native country. Traditions differ with regard to his after life. According to some accounts, he went to Ætolia, and afterward returned and gained possession of Argos. Another relates that, in attempting to return to Argos, he was driven by a storm upon the coast of Italy, where he was kindly received by King Daunus, whom he assisted in a war against a neighboring tribe, and whose daughter Euippe he received in marriage. **II.** A king of the Bistones in Thrace, son of Mars and Cyrene, celebrated for his mares, which he fed upon human flesh. To obtain possession

of these mares was one of the twelve labors of Hercules. The hero slew Diomedes, whose body he gave to the mares, which became tame after eating their master's flesh.

DION CASSIUS COCCEIANUS, a historian of Rome, born in Nicæa, Bithynia, about A. D. 155, went to Rome about 180, where he was made senator. He was afterward appointed to many offices of trust by different emperors, and was twice consul. Having become odious to the prætorian guards, because, it is said, of his severe discipline, he obtained permission from the emperor Alexander Severus, in 229, to retire to his native city, where he spent the remainder of his days. His great work was a history of Rome written in Greek, divided into 80 books, and containing an account of the rise and progress of the state from the landing of Æneas in Italy until A. D. 229, giving only a slight sketch of events down to the time of Julius Cæsar, but dwelling with minuteness on the history of later times, and especially on that of the author's own age. Of this work, which is written with clearness, diligence, and general accuracy, but in a faulty style, 19 books (from the 36th to the 54th) remain entire. Fragments of the first 35 have been collected, and there are abridgments of the last 26, as well as of the entire work. One of the best editions is that of Sturz (9 vols. 8vo, Leipsic, 1824-'43). An English translation of Xiphilin's abridgment was published in London in 1704.

DION CHRYSOSTOMUS (the golden-mouthed), a Greek rhetorician, born in Prusa, Bithynia, about the middle of the 1st century, died in Rome about 117. In the practice of his art at Rome he incurred the hostility of the emperor Domitian, and in consequence of a decree of the senate he was obliged to flee from Italy. In the habit of a beggar, with Plato's "Phædon" and Demosthenes's "Oration on the Embassy" in his pocket, he wandered through Thrace and the countries bordering on the lower Danube, and on receiving intelligence of the death of Domitian (96) used his influence and his oratorical powers with the army stationed on that frontier in favor of Nerva. It is probable that he returned to Rome on the accession of this emperor, from whom as well as from his successor Trajan he received tokens of marked kindness. He was an essayist rather than an orator, and his writings are distinguished for elegance of style. Of his orations 80 are extant. There is a very good critical edition of them by Reiske (2 vols. 8vo, Leipsic, 1784).

DION OF SYRACUSE, a disciple of Plato, celebrated for having overthrown the power of Dionysius the Younger, tyrant of Syracuse, born in that city toward the close of the 5th century B. C., killed in 354 or 353. Under Dionysius the Elder, to whom he was doubly related by marriage, he enjoyed the favor of the court, and amassed great wealth; but when the younger Dionysius succeeded to the throne (367), Dion, whose austere manners were a constant rebuke of the royal debaucheries, fell into

disfavor, and at last was banished from Sicily. He found refuge and a friendly reception in Greece, where he lived for a while in affluence, his income being allowed to reach him. Soon, however, this was cut off, and to complete his disgrace his wife Arete was compelled to marry another man. Dion now resolved to avenge himself and his country at the same time. Having assembled about 800 troops, he sailed from Zacynthus (357), landed in Sicily, and easily obtained possession of Syracuse in the absence of Dionysius. The troops of the tyrant still held the citadel on the neighboring island of Ortygia, whence they made a sally soon after the arrival of Dion, and were repulsed only after a fierce combat, during which Dion himself displayed great courage. He was at first received by the citizens with enthusiasm, and on his entry into the city he proclaimed liberty to Syracuse. But, irritated by his harsh manners, suspecting his designs, and incited by the demagogue Heraclides, the people afterward expelled him and his troops. The Syracusans soon had reason to repent of their conduct, for the soldiers of Dionysius, aware of their dissensions, made a sally, regained part of the city, set fire to the houses, and began a fearful massacre. The banished philosopher was entreated to return, and, marching immediately, after a hard contest he obtained full control of Syracuse. He caused Heraclides to be put to death. This act greatly injured his popularity, already damaged by his repellent and austere manners; a conspiracy was formed against him, and he was assassinated.

DIONÆA (*D. muscipula*, Ellis), Venns's fly-trap, an insectivorous plant inhabiting the savannas around Wilmington, N. C., and only found in that district. Audubon's affirmation that he had seen it in Florida of enormous size is not confirmed. It belongs to the same natural order as the droseras, or sundews, the common species of which capture flies as effectually as dionæa, but by a different contrivance. It was discovered by the elder Bartram, sent to Collinson, and well described by Ellis in a short treatise addressed to Linnæus. The brief account given by the latter, which was generally copied till recently, was wrong in stating that the trap opens after an insect it has caught becomes quiet; it does not open until all the soft parts of the insect are extracted. To aid in this, a glairy liquid is secreted from innumerable glands which stud the face of the trap, which after maceration of the captive is reabsorbed. The plan and action of the trap may be gathered from the cut and a few words of description, partly condensed from the account of Dr. M. A. Curtis ("Journal of the Boston Society of Natural History," 1834). The trap, at the apex of the leaf, is fringed with stout bristles on each margin; it is aptly compared to two upper eyelids joined at their bases. On each side are three more delicate bristles, so directed that

an insect can hardly traverse it without touching one of them, when the two sides suddenly close upon the prey, the fringe of the opposite sides interlacing, like the fingers of the two hands clasped together. The sensitiveness resides only in these hair-like processes on the inside, as the leaf may be touched or pressed in any other part without effect. Soon the sides of the trap press down firmly upon the captive (when the fringe separates); the liquid is poured out, and finally absorbed, when the trap opens, and sometimes recovers its activity so as to capture a second insect. Ellis (and probably Bartram) noticed the glands and the fluid, but thought it was a lure for flies. Curtis showed that it appeared only after the capture. Canby lately proved that it was secreted by the leaf, and taken in again; also that bits of meat were similarly digested. Darwin had

Dionaea muscipula.

ascertained the same, also that this "gastric juice" had an acid reaction. He has also made the (still unpublished) discovery that either side of the trap may be paralyzed at will by a dexterous incision, indicating the existence in a plant of something corresponding to nerves. Burdon Sanderson has shown that in the closing movement the same electrical currents are developed as in muscular contraction.

DIONYSIUS, tyrants of Syracuse. **I. The Elder**, born in 431 or 430 B. C., died in 367. After completing his education he became a clerk in a public office, which he appears to have left at an early age to enter the army. In the political quarrels of the citizens he took the side of Hermocrates, and was severely wounded in aiding that party leader in his attempt to gain his restoration from exile. He afterward served with merit in the war against the Carthaginians. He availed himself of the general discontent with the conduct of the war to come forward in the popular assembly as the accuser of the unsuccessful Syracusan commanders, who had suffered Agrigentum

and other important cities of Sicily to be taken. He displayed so much vigor, and the condition of Syracuse was so critical, that he obtained a decree for deposing the obnoxious generals, and for appointing others in their stead, and was himself elected among the new officers. He then brought false accusations against his associates, and the people in 405 appointed him sole general, with full powers, and allowed him a body guard. He now began those measures which made him proverbial in antiquity as a tyrant. Concerning himself no longer for the deliverance of Sicily from the Carthaginians, he aimed only to subdue his native city. He induced the Syracusans to double the pay of the soldiers, appointed officers who were in his own interest, and by marrying the daughter of Hermocrates secured the support of the partisans of that leader. As commander-in-chief of the Sicilians, who had concentrated their forces at Geia, he offered battle to the Carthaginians in a manner so unskillful as to make it probable that he did not regret the defeat in which it resulted. He withdrew the inhabitants of Gela and Camarina to Leontini, and left the whole S. W. coast to the Carthaginians. This reverse enabled his enemies to raise a revolt in Syracuse, where he was now looked upon as a manifest traitor. They gained possession of the city, but their plans being disconcerted by the sudden return of Dionysius, they were driven out, though not until his wife had fallen a victim to their cruelty. The Carthaginian generals now besieged Syracuse, but the plague having broken out in their camp, they were satisfied with the immense advantages offered them by Dionysius without storming the place. He was recognized as ruler of Syracuse, and of a district around the city, but was to resign all claim to dominion over the island. He availed himself of the peace to establish his tyranny more firmly; and having fortified the isle of Ortigia, and excluded from it all but his immediate dependants, he built upon it a citadel which might serve as an impregnable asylum. The Carthaginians lost the advantages of the peace through negligence. Syracuse had in six years recovered her strength, and Dionysius undertook the recapture of the cities he had surrendered. The immense preparations which he made form an epoch in ancient military history. His machinists invented engines for throwing missiles, and especially devised the catapult. He also constructed ships having four or five banks of rowers, instead of the old triremes. He gained at first great success, and conquered Motya, the ancient seat of the Carthaginian dominion (396). His fleet, however, was defeated by that of the Carthaginians, which ravaged the northern coast of the island, overpowered Messina and Catana, and laid siege to Syracuse (395). But the plague, or some similar malady, again breaking out in the camp of the enemy, proved the safety of the city. Nearly the whole Carthaginian army was lost

by the pestilence, and the remainder purchased from Dionysius the privilege of a free departure. In the treaty which followed, the restrictions which had been imposed by the last treaty upon the government of Syracuse were removed. Dionysius carried on also a third and fourth war with Carthage, the results of which seem to have been only to re-establish the terms of the former peace. The intervals between these wars were harassed by the revolts of his subjects, which he avenged with cruelties. The frequent attempts upon his life made him suspicious. He durst not trust even his relatives, and his body guard was formed of foreigners. His palace was surrounded by a ditch, crossed by a drawbridge, and when he harangued the people it was from the top of a lofty tower. He built the terrible prison of the *lautumia*, cut deep into the solid rock; another of his prisons was so arranged that every word spoken within it was echoed into his chamber, and he is said to have passed entire days listening to the complaints of his victims. But tradition, in making of Dionysius the type of cruelty, has doubtless transmitted many unauthenticated stories concerning him. Dionysius was long engaged in ambitious projects against the Greek cities of southern Italy. He formed an alliance with the Locrians, and after suffering some reverses besieged and conquered Rhegium (387). Italy was now open to him, and he sought by establishing colonies upon the Adriatic to secure for himself a way into Greece. Already his name was known in the Peloponnesus, where he had contracted an alliance with the Lacedæmonians. He was now the recognized master of southern Italy, interfered in the affairs of the Illyrians, sent an army into Epirus, and received an offer of friendship from the Gauls, who had burned Rome. His settlements upon the Adriatic increased his wealth and strengthened his power, but they were his last great undertakings, and henceforth he disappears from history. His reign, which lasted 38 years, became milder toward its close. He left an immense military force and a powerful empire; and though he had governed as a tyrant, the old republican forms remained. Dionysius had a passion for literature, and wrote lyrics and tragedies, none of which have been preserved.

II. The Younger, son and successor of the preceding, born early in the 4th century B. C. On his accession to power in 367 he was entirely unused to public affairs, and devoted to pleasure. He hastened to conclude a peace with the Carthaginians, abandoned his father's projects of foreign settlements and power, and gave himself up to luxury and sensuality. His brother-in-law Dion undertook to excite him to a noble career. He conversed with him upon the doctrines of Plato, and through his influence that philosopher was invited to revisit the court of Syracuse, at which under the elder Dionysius he had met with very unfavorable treatment. Plato proposed an amendment

to the constitution, changing the government from nominal democracy and real despotism to a limited popular authority, in which all the members of the ruling family should form a college of princes; but the monarch rejected this proposal. Soon afterward he took up his residence in Locri, and gained some advantages against the Lucanians; but the wild orgies to which he surrendered himself drew upon him the contempt both of his subjects and of foreigners. With a small band of exiles, and with two vessels laden with arms, Dion landed in Sicily in 357, and was joined by thousands as he marched toward Syracuse. Dionysius, hearing of his coming, instantly returned from Locri, but his troops were defeated, and he was obliged to retreat to the citadel; and finding it impossible to retain his power, he collected his most valuable property and fled to Italy, leaving the citadel in possession of his son and friends. He returned to Locri, where he was kindly received; but he took advantage of the good will of the people to make himself tyrant of their city, and treat them with the greatest cruelty. He held Locri thus for several years; but in 346 he availed himself of internal dissensions in Syracuse to recover his power in his old capital, and continued to reign there during the next three years. The former Syracusan empire was now, however, in fragments; and even the garrison which defended the tyrant in the citadel was rebellious. Timoleon, the Corinthian, landed in Sicily, and marched against Syracuse, and Dionysius consented to an arrangement, by which he was allowed to depart in safety to Corinth (343). He passed the remainder of his life with low associates, supporting himself, according to various traditions, as schoolmaster, actor, and mendicant priest of Cybele.

DIONYSIUS, or Denis (Port. DIXIZ), king of Portugal, born in Lisbon, Oct. 9, 1261, died at Santarem, Jan. 7, 1325. He was the son of Alfonso III., whom he succeeded Feb. 16, 1279. He associated with himself in the government his mother Beatrix de Guzman, but soon quarrelled with her because she favored the cause of his younger brother Alfonso, who aspired to the throne. Beatrix retired to the court of her father, Alfonso X. of Castile and Leon, and Dionysius strengthened his power by marrying in 1283 Elizabeth of Aragon, afterward canonized as St. Elizabeth. He at once set about making reforms in his kingdom. He restricted the power of the clergy, reformed the administration of civil and criminal justice, restrained the arrogance of the nobles, promoted industry and commerce, and augmented the public revenues by a wise administration. He visited all the provinces that had been laid waste by the wars of his predecessors, built and fortified over 40 cities and towns, planted the forest of Leiria, which two centuries after furnished the timber for the ships which gave Portugal her maritime ascendancy, opened and worked the mines in his

kingdom, and founded the university of Lisbon (now of Coimbra, the only one in Portugal). He forbade the use of the Latin language in public documents, caused many works to be translated into Portuguese, and cultivated poesy himself with some success. So many and so patriotic were his labors that he acquired the title of father of his country. He was also known as the protector of letters, the just, the liberal, and the laborer. His latter years were embittered by the unfilial conduct of his illegitimate but much favored son Affonso, who conspired against him, and by troubles with the church. The military order of Christ was founded by Dionysius in 1319.

DIONYSIUS OF ALEXANDRIA, a saint and bishop of the church, born in Alexandria, Egypt, late in the 2d century, died there A. D. 265. He was of a noble and wealthy pagan family, but in the course of his early philosophical studies his attention was turned to the Christian sacred writings, especially the epistles of Paul, and he became a convert. He left the heathen schools, became a pupil of Origen, was ordained priest, and about 232 was chosen to succeed Heraclas as chief of the Alexandrian school of theology. About 247 he was raised to the office of bishop, made vacant by the death of Heraclas. Shortly after this violent persecutions broke out against the Christians. The populace of Alexandria had been stirred up against them by a heathen prophet, and the edict of Decius, which reached that city in 250, put arms in the hands of their enraged enemies. Dionysius, who had taken an active part in preparing the Christians for the coming trial, was arrested, sent to be put to death, rescued by a band of peasants, and remained concealed more than a year in the Libyan desert, sending continual messages meanwhile to his brethren in the city. In the persecution under Valerian in 257, Dionysius was again exiled from his see. After his restoration (260), brought about by an edict of Gallienus favorable to the Christians, he was more than once called to mediate on occasions of public strife.

—The writings of Dionysius were numerous, but most of them have been lost. They were mainly controversial. He wrote two books refuting the theory of Nepos, of the millennial earthly reign of the Saviour. In opposition to Sabellius, who denied the distinct personality of the members of the Trinity, he wrote several books and epistles, caused the heresy to be condemned by a council, and insisted upon the distinction between the Son and the Father so strongly that it brought upon him the charge of denying the divinity of Christ, against which he defended himself. He also defended the doctrine of the divinity of the Holy Spirit. In opposition to Paul of Samosata, Dionysius maintained the consubstantial nature of the Son and the Father. The fragments of his writings were collected by Simon de Magistris (folio, Rome, 1796), and are also contained in the *Bibliotheca Patrum*, vol. iiii.

DIONYSIUS THE AREOPAGITE, an Athenian, who was one of the council of the Areopagus when St. Paul preached to the Athenians. He is said to have studied first at Athens, and afterward at Heliopolis in Egypt. There is a legend that when he observed in Egypt the darkening of the sun during the crucifixion of Jesus Christ, he exclaimed, "Either God himself is suffering, or he is sympathizing with some one who is suffering." He was converted by the preaching of Paul, about A. D. 50, is mentioned in the Acts of the Apostles (xvii. 34), and was probably the first bishop of Athens, having been appointed to that office, it is said, by St. Paul himself. It is also believed that he suffered martyrdom, but in what year is not known. It is not certain that he ever wrote anything, but his name has been given to four theological treatises, imbued with the mystical doctrines of the Alexandrian Platonism. These works, which are first mentioned in the 6th century, contain allusions to facts and quotations from authors subsequent to the apostolic age, and were probably written by some Neo-Platonic Christian of the 4th or 5th century.

DIONYSIUS EXIGUUS (the Little, so named from his small stature), a Roman monk of the 6th century. He was a native of Scythia, but became abbot of a monastery in Rome, where he died about 550, during the reign of Justinian. He gave to the western church the first regular collection of ecclesiastical laws, comprising the canons of the apostles and of several councils, and the decrees of some of the popes. But his chronological labors have given him greater celebrity. He is reputed the founder of the era which for more than ten centuries has been observed by Christian nations. Before him the Christian era had been calculated from the death of Christ; he first fixed the year of the incarnation in the 754th year of Rome, and this, at least after the 8th century, was universally adopted as the commencement of the era. (See CHRONOLOGY.)

DIONYSIUS OF HALICARNASSUS, a Greek historian and rhetorician, born in Halicarnassus, Caria, about 70, died in Rome about 7 B. C., having removed there about 29. Of his life we know almost nothing, excepting that it was for the most part spent in literary labor. He wrote many rhetorical and critical essays, and shortly before his death published the greatest of his works, entitled *Ῥωμαϊκὴ Ἀρχαιολογία*, or "Roman Antiquities." It was in 20 books, and contained the history of Rome from the earliest mythical times to the era of the Punic wars, where the history of Polybius begins. Only the first 11 books remain, which end with the year 441. Several fragments and extracts from the last nine books have been preserved in the collections made by command of the emperor Constantine Porphyrogenitus in the 10th century. The best editions of his works are those of Hudson (Oxford, 1704) and Reiske (Leipsic, 1774-'6). Such of his rhetor-

ical compositions as have been preserved have been published separately by Gross and by Westermann. There is an English translation of the "Roman Antiquities," by Edward Spelman (4 vols. 4to, London, 1758).

DIONYSUS. See **BACCHUS**.

DIOPHANTUS OF ALEXANDRIA, the only Greek writer on algebra, first mentioned by John, patriarch of Jerusalem, in the 8th century, unless he be identical with the astronomer Diophantus, on whose work Hypatia is said by Suidas to have written a commentary. There are no more definite indications of his era. When his MSS. came to light in the 16th century, thirteen books of his *Ἀριθμητικά* were announced, only six of which have been produced. Another treatise by him, *Περὶ τῶν Ἀριθμῶν Πολυγώνων* ("On Polygonal Numbers"), is extant. These books contain a system of reasoning on numbers with the use of general symbols, and are therefore algebraical treatises, though the demonstrations are written out at length in common language. The term Diophantine was applied by some modern mathematicians to the peculiar analysis employed in investigating the theory of numbers. The similarity of the Diophantine and Hindoo algebra renders it probable that they had a common origin, or that one was derived from the other. The best edition of his works is that of Fermat, in Greek and Latin (Toulouse, 1670). They were translated into German by Schulz (Berlin, 1821). The six books of the "Arithmetic" were translated into French by Stévin and Girard (Paris, 1625).

DIOPTRICS. See **OPTICS**.

DIOSCORIDES, *Pedacius* or *Pedanius*, a medical and botanical writer of the 1st or 2d century A. D., probably a native of Anazarbus in Cilicia. He made collections of plants in Asia Minor, Greece, Italy, and Gaul, and wrote a treatise in five books on *materia medica* (*Περὶ Ὑγίης Ἰατρικῆς*), a work which enjoyed the highest reputation until the 17th century. It is now chiefly valuable as illustrating the opinions of ancient physicians and giving some idea of their attainments in natural history. It has been translated into Arabic, Italian, Spanish, French, and German, and many editions of it have been published in Latin and Greek.

DIOSCURI. See **CASTOR** and **POLLUX**.

DIPHThERIA (Gr. *διφθέρα*, membrane), the name of a disease which has heretofore received a variety of appellations, such as *ulcus Egyptiacum vel Syriacum*, *cynanche maligna*, *angina maligna*, *angina gangrænosæ*, *morbis suffocans vel strangulatorius*, *garrottillo*, *angina suffocativa*, malignant sore throat, epidemic croup, &c. The term diphtherite was applied to it by Bretonneau in 1821, whence originated the name diphtheria which is now in common use, relating to the formation of a false membrane in the throat and in other situations, analogous to that which characterizes the disease called, among other names, diphtheritic laryngitis, or true croup. (See **CROUP**.)

Recent microscopical observations, however, appear to show points of difference between the pseudo-membranous morbid product in the two diseases. In diphtheria the false membrane, accompanying inflammation, appears almost invariably in the fauces or throat, and in many cases it is limited to this situation. It may extend more or less over the mucous surface within the mouth and nostrils. It is not infrequently produced within the windpipe, giving rise to all the symptoms of true croup, and generally proving fatal. Mucous surfaces elsewhere are in some cases the seat of this peculiar form of inflammation; namely, in the eyes, the ears, the organs of generation, &c. A similar false membrane is produced in some cases on the skin, in situations where there may be either wounds, abrasions, or sores. The local affections thus characterized cannot be said to constitute the disease, but they are to be considered as the manifestations of a morbid condition of the system, probably involving special blood changes, the essential nature of which is at present unknown. In other words, diphtheria belongs among the diseases which are distinguished nosologically as general or constitutional. The disease rarely occurs except as an epidemic. Epidemic diphtheria has occurred in all countries, but in the United States only occasional sporadic cases were observed during the first half of the present century. Since about 1856, however, there have been repeated epidemics in different parts of the country. Whether it be one of the communicable diseases, that is, diffused by contagion or infection, is an open question. Persons between 3 and 12 years of age are most apt to be affected with it, but no period of life is exempt from a liability to it. The false membranes are found frequently to contain a parasitic fungus, the spores and sporules of a cryptogamic plant; and the idea has been entertained that the disease is due to the presence of these. It seems, however, more reasonable to suppose that they are merely incidental to the local affection, the morbid products furnishing only a proper nidus or soil for their growth and reproduction. Different epidemics differ much in the rate of mortality. The disease is sometimes mild, the local manifestation being confined to the throat, and the constitutional symptoms slight. In other cases it has a degree of violence and a fatal tendency which entitles it to be classed among the malignant diseases. Death sometimes takes place within 48 hours after the attack. The degree and extent of local manifestations are in general commensurate with the severity and danger. If the larynx becomes affected, the chances of recovery are very few. Frequent vomiting, diarrhœa, hæmorrhage from the nostrils or elsewhere, frequency and feebleness of the pulse, convulsions, delirium, and coma are symptoms which denote great danger. If the larynx is affected, death may take place from suffocation. In the fatal cases in which the

larynx escapes, the immediate cause of death is exhaustion. Paralysis frequently occurs as a sequel. The muscles of the throat are those most likely to become more or less paralyzed, rendering deglutition difficult and sometimes impossible. With or without paralysis in this situation, the muscles of the lower limbs may be paralyzed, or the muscles of an upper and a lower limb on one side. Occasionally the muscles of both the upper and lower limbs are affected. Vision may be impaired by paralysis of the external rectus muscle, causing strabismus or squinting; and not infrequently far-sightedness, or more rarely near-sightedness, takes place; and amaurosis occurs in some cases. The other special senses, hearing, taste, and smell, are sometimes affected. These varied paralytic affections generally occur within a few weeks after convalescence from the diphtheria. They are as likely to follow in cases where the disease was mild as where it was severe. As a rule complete recovery takes place, showing that the paralysis does not proceed from structural changes. The disease, when paralysis does not follow, generally leaves the patient feeble and anæmic for a considerable period. Sudden death from syncope has repeatedly occurred after convalescence had been declared, as a consequence of some muscular effort; hence the importance of enjoining quietude until the strength is in some measure restored.—The treatment has been supposed to embrace, as a highly important measure, cauterizing applications to the throat and to the local affection in other situations; the objects being to destroy or modify the special character of the inflammation, to limit its extension, and prevent the absorption of septic matter. Those who consider the efficient cause of the peculiar inflammation to be the presence of cryptogamic formations, are of course led to attach importance to applications which destroy vegetable life. For the most part, however, in this country, physicians have abandoned severe topical measures, limiting themselves to antiseptic and soothing applications. Clinical experiences seem to establish the propriety of this plan. The chief objects in the treatment are to palliate symptoms, and support the powers of life by the judicious employment of tonic remedies, conjoined with alimention and alcoholic stimulants. The latter are in some cases given in large quantity without inducing their excitant effects; and there is reason to believe that they are sometimes the means of saving life. In the cases in which the larynx becomes affected, the measures are indicated which belong to the treatment of true croup, and tracheotomy is to be resorted to if necessary to avert death from suffocation. The prospect of success from this operation is extremely small; yet, as it undoubtedly sometimes rescues a patient from impending death, it is the duty of the physician not to withhold the chances of life, however small, which tracheotomy affords.

DIPLOMATICS (Gr. *δίπλωμα*, a doubling; hence anything folded double, as a written document), the science of the knowledge of ancient documents, and especially of their age and authenticity. The charters of grants from sovereigns to individuals and corporations were formerly called diplomas, and the word is applied to all letters, documents, and pieces of writing of a public nature that have come down to us from the middle ages and the subsequent centuries. The ancient public documents of the Greeks and Romans have perished, except such as were inscribed on stone or metal. But a vast mass of manuscripts of the middle ages exists in Europe, whose dates and authenticity can only be settled by careful and skilful investigation. The quality of the parchment or paper and of the ink, and the style of the handwriting, are the means chiefly relied upon to determine the age of the document. Formerly ink was made of soot, and red ink made of vermilion was sometimes used. Those who apply themselves to the study of diplomatics can easily distinguish the ink and the parchment and paper of one epoch from those of another. The variations in handwriting are also so great that by the character alone it is possible to pronounce within 40 or 50 years when any diploma was written. In Europe the study of diplomatics has been much cultivated. The standard book of reference on the subject is the *Nouveau traité de diplomatique, par deux Bénédictins* (6 vols. 4to, Paris, 1750).

DIPPEL, Johann Konrad, a German mystic and rationalist, born at the castle of Frankenstein, Hesse, Aug. 10, 1673, died at Berleburg, April 25, 1734. He was the son of a clergyman, and at an early age showed a strong interest in religious matters. He studied theology at Giessen and philosophy at Wittenberg, and went subsequently to Strasburg, where he led a disorderly life, and had to leave the city, it is said, on account of being implicated in a bloody affray. He frequently appeared as a preacher, and also as a lecturer on astrology and chiromancy, and published in 1697 a pamphlet entitled *Orthodoxia Orthodoxorum*, and in 1698 another, called *Papismus Protestantium vapulans*, in which he attacked the orthodox party, rejecting the doctrines of the atonement and of the efficacy of the sacraments. He was consequently obliged to lead a wandering life to avoid prosecution. Having squandered his property in experiments in alchemy, he went to Leyden, obtained the degree of doctor of medicine, and began to practise as a physician. He published subsequently some other pamphlets, one of which, entitled *Alea Belli Muselmanici* (Amsterdam, 1711), caused his exile from Holland. He went to Denmark, where he continued to declaim against the clergy and the churches, for which he was arrested and imprisoned. After his release he went to Sweden, where he practised as a physician with considerable success; but having pub-

lished a pamphlet regarded as heretical, he was expelled from the country and soon afterward died. He acquired much scientific knowledge and made some valuable discoveries. The main point of his doctrine was that Christianity consists solely in the practice of virtue, of self-denial, and love for mankind. He published his writings under the name of Christianus Democritus (collected under the title of *Eröffneter Weg zum Frieden mit Gott und allen Creaturen*, Amsterdam, 1709; enlarged ed., Berleburg, 1743). He attracted much notice in his day in Sweden and Germany, and is frequently mentioned by Swedenborg in his "Spiritual Diary." His biography was written by Ackermann (Leipsic, 1781), and Buchner has given a memoir of him in the *Historisches Taschenbuch* for 1858.

DIPTERA (Gr. *dis*, twice, and *πτερόν*, wing), an order of insects, containing the fly, mosquito, &c., characterized by two wings, two knobbed threads (*halteres*, balancers or poisers) behind the wings, and a horny or fleshy proboscis. They undergo a complete transformation; the larvæ, usually called maggots,

Larva and Imago of the Bot Fly of the Ox (*Hypoderma bovis*).

have no feet, and have the breathing holes generally in the posterior part of the body; the pupæ or nymphs are either incased in the dry skin of the larvæ, or naked, showing the wings and legs free and unconfined. The head is large, globular, connected with the body by a very slender neck, and is capable of a considerable pivot-like motion; the greater part, especially in the males, is occupied by the brilliant compound eyes, the single ocelli, when they exist, being on the top of the head. Under the head is the proboscis or sucker, which in some kinds can be drawn up and concealed in the mouth; it consists of a long channel, ending in two fleshy lips, and enclosing on its upper side from two to six fine bristles, sharp as needles, and making the punctures so familiarly known in the case of mosquito bites; as this apparatus takes the place of the jaws of other insects, these wounds may properly be called bites. The saliva which flows into the wounds causes the well known swelling and itching. The sheath serves to main-

tain the lancets in position, and the latter having made their punctures form a groove along which the vegetable or animal fluids rise by the suction power of the insect and by capillary attraction. In the flies which only lap their food the proboscis is large and fleshy. The antennæ in the gnats are long and many-jointed, in the flies short and thick, at the base of the proboscis. The wings are generally horizontal and delicate, with many simple veins; the posterior wings are metamorphosed into the balancers or poisers. Some entomologists, as Latreille, think the poisers do not correspond to posterior wings, but are vesicular appendages connected with the posterior respiratory tracheæ of the chest. Just behind the wing joints, and in front of the poisers, are two small convex scales, opening and shutting with the wings, and called winglets. The thorax is often the hardest part of the insect, composed principally of the mesothorax. The abdomen is not always united to the thorax by the whole of its posterior diameter, and in many females ends in a retractile jointed ovipositor. The legs, six in number, are usually long and slender, with five articulate tarsi and two claws at the end, besides two or three little cushion-like expansions, by means of which they are able to ascend the smoothest surfaces and to walk with the back downward with perfect security. According to Marcel de Serres, the dorsal vessel (the heart) in diptera is narrow and its pulsations are frequent. Respiration in the adult is carried on by vesicular and tubular tracheæ. The nervous system consists of an aggregate of cerebral ganglia, and in some of nine other ganglia, three in the thorax and six in the abdomen, connected by longitudinal simple commissures or cords; the larvæ have usually one more pair of ganglia than the adults, and have the commissures often double. The proboscis being the transformed under lip, often geniculate, the perforating bristles may be regarded as maxillæ, mandibles, and tongue. In those larvæ which have a distinct head, as in the mosquito, the jaws are arranged for mastication, though some of the pieces are wanting; but in the acephalous maggots the mouth is suctional. Communicating with the gullet is a thin-walled vesicle, the sucking stomach, in which the fluids swallowed are temporarily deposited; the stomach proper is long and narrow, and makes many convolutions in the abdomen. The end of the intestine is short, muscular, and pyriform. The uriferous vessels are long, and generally four in number, opening into the lower extremity of the stomach; the ovaries consist usually of many short three- or four-chambered tubes, terminating in a short or a convoluted oviduct; the testicles are two, simple, and generally oval or pyriform, with long vasa deferentia ending in the ejaculatory duct in common with two simple accessory mucous glands, and with horny valves enveloping the projecting copulatory organ. The larvæ or maggots are

without legs, generally whitish, and vary exceedingly in form and habits. The larvæ of the mosquito are aquatic, breathing with the head downward through the tubular tail surrounded with feather-like appendages, and the pupæ tumble about in water by means of two oval fins. These larvæ, and those of most flies which have four or six bristles in the proboscis, have a distinct horny head, and cast their skins to become pupæ, which are generally brownish; many have thorns and prickles on the body by which they work their way out of their coverings; a few cover themselves with silken webs and spin cocoons. The larvæ of other flies, with a soft retractile head, living by suction, increase rapidly in size, and change their form without casting off their skins, which shorten and harden, forming a case within which the larva changes into a pupa, which comes forth a fly by forcing off one end of the case. Though this order contains the bloodthirsty mosquito, the disgusting flesh fly, and many insects depositing their eggs in the bodies of living animals, it is most useful, supplying food to insectivorous birds, and consuming decomposing animal and vegetable substances. Their life in the perfect state is short, very few surviving the rigor of winter.—Among the genera with many-jointed antennæ the following are the most interesting and best known: *Culex* (Linn.) contains the well known gnats and mosquitoes, whose larvæ and pupæ are so common in stagnant water, called wigglers and tumbler, and whose adult females pierce with their lancets and annoy by their nocturnal hum the human race from Lapland to the tropics; the best known species are the *C. pipiens* of Europe, and the *C. Americanus* of this country, which is probably distinct. The genus *cecidiomyia* (Latr.) includes many species interesting to the agriculturist, as the Hessian fly (*C. destructor*, Say), the wheat fly (*C. tritici*, Kirby), and the willow-gall fly (*C. salicis*, Fitch), injurious in the larva state. The genus *tipula* (Linn.), especially *T. oleracea* (Linn.), commonly known in England by the name of Harry Long-legs, is noted for its depredations in the larva condition on the tender roots of meadow plants. In the genus *simulium* (Latr.) are the black fly and the midges of the northern parts of America. The black fly (*S. molestum*, Harris) fills the air during the month of June in Canada and the northern states; it flies in the daytime, and is so savage that every bite draws blood, sometimes accompanied by considerable irritation; it is black, with transparent wings, and about $\frac{1}{10}$ of an inch long. After continuing through June, it is followed by another species (*S. no-civum*, Harris), called “no-see-em” by the Indians of Maine from their minuteness; they come forth toward evening, creep under any kind of garment, and produce a sharp, fiery pain without drawing blood; they are very troublesome in July and August. Among those

with few joints in the antennæ is the genus *tabanus* (Linn.), which contains the large horse flies, as *T. bovinus* (Linn.), dark brown, an inch long, common in Europe, where there are more than 40 other species. The most common American species is *T. atratus* (Fabr.), black with a whitish bloom on the back; the eyes are very large, shining black, with two jet-black bands across them; it is about an inch long, with an expanse of wings of two inches. The orange-belted horse fly (*T. cinctus*, Fabr.) is smaller and less common, black, with the first three rings of the body orange. A smaller species is *T. lineola* (Fabr.), with a whitish line along the top of the hind body. In summer these flies are very troublesome to cattle and horses, being able to pierce through the thickest hide with their six-armed proboscis; a strong decoction of walnut leaves, applied as a wash, is said to keep them off. The golden-eyed forest flies (*chrysops*, Meig.) are known by their brilliant spotted eyes and their banded wings; smaller than horse flies, they resemble them in their habits, frequenting woods and thickets in July and August; some are wholly black, others striped with black and yellow. The bee fly (*bombylus æqualis*, Fabr.) flies with great swiftness through sunny paths in the woods, hovering over flowers and sucking their honey, like humming birds; it is about three eighths of an inch long, shaped like a humble-bee, and covered with yellowish hairs; the expanse of the wings is about an inch; they are divided longitudinally into two equal parts by the colors, the outer half being dark brown and the inner colorless. Among the flies which prey on other insects, seizing them on the wing or on plants, is the genus *midas* (Latr.), of which the orange-banded species (*M. filatus*, Fabr.) is sometimes $1\frac{1}{2}$ in. long and $2\frac{1}{2}$ in. in expanse of wings; the general color is black; it frequents the woods in July and August, where it may be often seen flying or basking in the sun; the larva is a cylindrical maggot, growing to the length of 2 in.; the pupa measures $1\frac{1}{2}$ in. in length, is brown, with forked tail, eight thorns on the fore part of the body, and numerous sharp teeth on the edges of the abdominal rings; it pushes itself half out of its hole when the fly is about to come forth. The genera *laphria* (Fabr.) and *asilus* (Linn.) are also predaceous in the winged state; in the former the antennæ are blunt at the end, in the latter slender-pointed; the former resemble large humblebees in their thick and heavy bodies and legs. In the larva state these asilids live in the ground, where they do much mischief to the roots of plants. The soldier flies (*stratiomydæ*) have two spines on the hinder part of the thorax; the proboscis contains only four bristles, and ends with fleshy lips adapted for sucking vegetable juices; they are fond of wet places, and their larvæ live in stagnant pools, some thrusting their breathing tube out of the water; they undergo transformation within the hardened larval skin. The

genus *stratiomys* (Geoff.) has a broad oval body, of a dark color, with yellow markings on each side, and the antennæ somewhat spindle-shaped. The genus *sargus* (Fabr.) is said to have no spines on the thorax, a slender body, of a brilliant grass-green, about half an inch long, with a bristle on the end of the antennæ. These insects delight in sunny weather, being dull and inactive in cloudy days; the larvæ are found in dung and rich mould. The *syrrhidae* have also a fleshy proboscis, and live on the honey of flowers; they resemble bees, wasps, and hornets in shape and color, and sometimes lay their eggs in the nests of these insects; others drop their ova among plant lice, which the young eagerly feed upon. The larvæ of the genus *helophilus* (Meig.) were named by Réaumur rat-tailed maggots, from the great length of their tubular tails, which serve as respiratory organs; the experiments of Réaumur show that while the insect lies concealed in mud, its respiratory tube may reach five inches to the surface of the water; it seems to be composed of two portions, which slide one into the other like the joints of a telescope. Some of the larvæ of this family live in rotten wood. The family *conopidae* resemble slender-bodied wasps; the antennæ are long and three-jointed; the proboscis is long, slender, and geniculate. The genus *conops* (Linn.) is generally black, and about half an inch long; more than 20 species are described, usually found on flowers in June and July, but not in large numbers; they deposit their eggs in the larvæ and the perfect insects of the humblebee, in whose bodies their young undergo metamorphosis. The common stable fly belongs to the genus *stomoxys* (Fabr.); the flesh fly to *sarcophaga* (Meig.); the house fly and the meat fly to *musca* (Linn.); the flower flies to *anthomyia* (Meig.); the cheese fly to *piophilæ* (Fallen.); the dung fly to *scatophaga* (Meig.); the fruit and gall flies to *ortalis* (Fallen.) and *tephritis* (Latr.). (See FLY.) The gadflies or bot flies, comprising the genera *astrus* (Linn.) and *gasterophilus* (Leach), affect respectively the ox and the horse. (See GADFLY.) Various winged and wingless ticks infest the horse, sheep, and birds, belonging to the order of *diptera*, but forming with the spider flies the order *homaloptera* of Leach and the English entomologists; they include the genera *hippobosca* (Linn.), *melophagus* (Latr.), and *ornithomyia* (Latr.). (See TICK.) The *pulicidae*, or fleas, are wingless diptera, with hard, compressed bodies, a sucker-like mouth, and hind legs formed for leaping; they live principally upon the bodies of other animals. (See ERIZOA.)—At the end of this order may be mentioned the genus *nycteribia* (Latr.), the spider fly, a wingless insect resembling a spider; the small head seems a mere tubercle on the anterior and dorsal portion of the thorax; the eyes are like minute grains; the thorax is semicircular; the antennæ are extremely short, inserted close together, and immediately in front of the eyes. These

flies nestle in the hair of bats, among which they move with great rapidity; according to Col. Montagu, when they suck the blood of bats they are obliged to place themselves on their backs on account of the dorsal position of the head. This last division of the diptera is not produced from eggs deposited in the usual manner, but the larva is hatched and developed within the body of the mother, and is not born till it arrives at the state of pupa; hence these genera have been called *pupipara* by Latreille. The pupa when born is nearly as large as the parent, enclosed in a cocoon, the altered skin of the larva at first soft and white, but soon growing hard and brown; it is notched at one end, where the mature insect escapes. The genera of diptera make up for their small size by their countless swarms.

DIPTYCHS (Gr. διπτύχα, from δίς, twice, and πρῶσεν, to fold), tablets anciently used for civil and ecclesiastical purposes. Among the Romans and Greeks, the term at the commencement of the Christian era designated two tablets united by a hinge, and used as a note book. Even when several tablets or leaves were included between the ornamented covers, they were still called diptychs. The tablets were made of ivory, wood, or metal, and sometimes of slate or papyrus, or of gold and silver. The external faces were more or less ornamented; the interiors were smooth, so as to receive a coating of wax, or to admit leaves of parchment or papyrus. They were carried suspended to the belt or wrist; served for epistolary correspondence (in which case they were sealed by the writer before being sent to their destination); were presented as gifts by consuls and other high dignitaries to the emperors and senators, and to their friends and relatives; and were even distributed by them among the people on the occasion of the public games, &c. The oldest consular diptychs known bear the date of A. D. 405, and are attributed to Stilicho.—In liturgical usage the diptychs were public lists or tables, which in the early church were read by the deacon from the ambon during the celebration of the liturgy. They contained, in so many separate columns or leaves, the names of the persons who made “the offering” that day; those of the chief personages, lay and ecclesiastical, in communion with that particular church; the names of the saints, martyrs, and confessors of the faith; and those of the faithful who had departed this life in the orthodox communion. Hence, to have the name of any person, living or dead, erased from the diptychs, was equivalent to an act of excommunication.—In art the name diptych is given to two panels united by a hinge, whose interior surface is painted. It is common to meet with such diptychs containing on one side the angel Gabriel, and on the other the Virgin Mary receiving his salutation. When there is a large central compartment, with two side panels folding over it, it is called a triptych. Such is the celebrated *Dombild* or altarpiece

of the cathedral of Cologne, having in the centre the adoration of the Magi, and on the sides the legend of St. Ursula and her companions.

DIRCE, in Greek mythology, daughter of Helios and wife of Lycus, king of Thebes, who had repudiated Antiope, his first wife. Dirce, jealous of the latter, had her put in chains, but Zeus aided her to escape to Mount Cithæron, where she gave birth to two sons by him, Amphion and Zethus. To revenge the injury to their mother, these two went to Thebes, slew Lycus, and tied Dirce to the horns of a bull, by which she was dragged about until dead. The punishment of Dirce is the subject of the celebrated marble group known as the Farnese bull, in the national museum at Naples. According to Pliny, it was the joint work of the Rhodian sculptors Apollonius and Tauriscus, who cut it from a single block of marble, and was sent from Rhodes to Rome. It was discovered in 1546 in the baths of Caracalla, much injured, and was restored by Bianchi under the superintendence of Michel Angelo. It was at first placed in the Farnese palace in Rome, but in 1786 was removed to Naples. It represents Amphion and Zethus restraining the struggling bull, and preparing to bind Dirce to his horns, with Antiope standing near. Several animals are represented about the base.

DIRECTORY, Executive (Fr. *directoire exécutif*), the name given to the executive government of the first French republic, established by the constitution of Fructidor, year III. (August, 1795). This constitution was framed by the moderate republican party, whose influence prevailed after the fall of Robespierre. The legislative power was vested by it in two assemblies, the council of 500 and the council of the ancients, the former having the exclusive right of proposing laws for the consideration of the latter. The judicial authority was committed to elective judges. The executive directory consisted of five members, and was chosen one each year by the council of the ancients from a list of candidates presented by that of 500. The directory promulgated the laws, appointed the ministers, and had the management of military and naval affairs, and the right of repelling hostilities, though not of declaring war. The directors decided questions by a majority vote, and presided by turns three months each, the presiding member having the signature and the seal. During their term of office none of them could have a personal command, or absent himself for more than five days from the place where the councils held their sessions, without their permission; and after they had left office they could hold no command for two years, nor be re-elected for five. The balance of power established by this constitution excited antagonism between the different branches of the government. The convention decreed that in the first election two thirds of the members of the two councils should be chosen from its own body. This arbitrary act led to violent agita-

tions in Paris, and finally to an insurrection of the royalist sections on the 13th Vendémiaire (Oct. 5, 1795), which was suppressed by Barras and Bonaparte. The convention having held its closing session on Oct. 26, the two councils held their first on the 28th, and on Nov. 1 elected Barras and Laréveillière-Lépeaux, Rewbell, Letourneur, and Carnot as directors. Their first proclamation promised a firm rule and inspired confidence. Carnot organized the armies, and directed their movements; Moreau received the command of the army of the Rhine, Jourdan that of the Sambre and Meuse; Hoche suppressed the insurrection in the Vendée, and Bonaparte conquered Italy. But the elections of the year V. (May, 1797) gave the royalists a preponderance in the councils, which was supported by the minority of the directory, while Barras, Laréveillière, and Rewbell sided with the minority in the legislative bodies. The movements of the royalists became more and more threatening, when the majority of the directors agreed to save the republic by an act of violence. This was executed by the aid of the army on the 18th Fructidor (Sept. 4, 1797). More than 50 members of the two councils, with Carnot, Barthélemy, who had replaced Letourneur, and a number of other influential persons, were condemned to transportation, and a persecution of both royalists and anarchists was commenced. Merlin of Douai and François of Neufchâteau were substituted for the two proscribed directors, of whom Carnot escaped to Germany. Saved by the army of the interior, the republican rule was maintained by the victories and extortions of the armies abroad. The treaty of Campo Formio was concluded; Switzerland and the Papal States were overrun and revolutionized; and Bonaparte was sent to Egypt to attack England indirectly. But the extreme revolutionary party carried the elections for the year VI. (May, 1798), a part of which were annulled by another violation of the constitution. A new coalition against France was formed. Switzerland and Italy were lost as rapidly as won. The republicans became impatient of the rule of the directory, in which Treillard had replaced François, and Sieyès was elected instead of Rewbell. Finally the councils compelled Treillard, Merlin, and Laréveillière to resign on the 30th Prairial (June 18, 1799). Barras saved his office by the desertion of his associates, and maintained himself with Sieyès and the three new directors, Gohier, Moulins, and Roger Ducos, till the 18th Brumaire (Nov. 9, 1799), when Bonaparte overthrew the directory and the constitution, and became master of France under the title of consul. The directory ruled France four years and a few days, and had altogether 13 members, of whom only Barras officiated during the whole period.

DIRSCHAU, a town of Prussia, in the province of West Prussia, situated on the Vistula, 19 m. S. S. E. of Dantzic, on the railway from Berlin

to Dantzic; pop. in 1871, 7,761. The Vistula is crossed here by a magnificent railway bridge about 2,700 ft. long. The town is walled, and contains a Catholic and a Protestant church. The manufactures are principally of leather. Five annual fairs are held here.

DISCIPLES, Church of the, a religious body, designated as "Disciples of Christ," "Christians," the "Church of Christ," &c., resulting from an effort to effect union among the Protestant denominations in western Pennsylvania. In the beginning of the present century several independent religious movements for this purpose occurred in different parts of the United States. The one which gave immediate origin and distinctive character to the body now known as "Disciples" was initiated in 1809 by Thomas Campbell, aided by his son Alexander, to whose ability and energy its successful progress is mainly attributed, and by whom it was chiefly directed. The original purpose was to heal the divisions of religious society, and to establish a common basis of Christian union. It was thought that these objects could be attained by taking the Bible alone as a guide, and its express teachings as the only authoritative standard of faith and practice, allowing meanwhile entire liberty of opinion in relation to all matters not fully revealed. Upon these principles a considerable society was formed, consisting chiefly of members from Presbyterian churches. After some time the questions of infant baptism and the use of sprinkling as baptism became matters of investigation, and it was finally decided by a large majority that there was no Scripture warrant for either practice. Becoming then a society of immersed believers, they were soon after united with the Redstone Baptist association, stipulating, however, in writing, that "no standard of doctrine or bond of church union, other than the Holy Scriptures, should be required." By means of this union with the Baptists, the principles and views of the Disciples, developed and defended by Alexander Campbell in his writings and public discussions, were widely disseminated. Meanwhile the study of the Scriptures led by degrees to the discovery and introduction of several characteristics of primitive Christianity which, as the Disciples held, had been long overlooked and neglected. Among these, a prominent one was "baptism for the remission of sins." As the apostle Peter, in reply to believing penitents who asked what they should do, said, "Repent and be baptized every one of you, in the name of Jesus Christ, for the remission of sins, and ye shall receive the gift of the Holy Spirit," it was believed that the same answer should still be given to such inquirers, and that it was the divine plan thus to impart through the institution of baptism an assurance of pardon. This became therefore a distinguishing feature of the reformation urged by the Disciples. Another characteristic was the practice of weekly communion, after the example of the primitive

church. In pressing these matters upon the acceptance of the Baptists, a spirit of opposition was at length aroused in various quarters, especially in Virginia and Kentucky, and a separation to some extent ensued, many of the Baptists remaining connected with the Disciples. At the close of 1831 their numbers were still further augmented by a union between them and a numerous body which had originated in Kentucky and some other western states, under the labors of B. W. Stone and others, who, some years prior to the movement led by Thomas and Alexander Campbell, had separated from the Presbyterian communion, and in like manner attempted to effect a union of Christians upon the Bible alone. These persons, adopting baptism for remission of sins, and the ancient order of things as practised by the Disciples, became entirely assimilated with the latter.—Although the Disciples reject creeds as bonds of fellowship, and disapprove of the technical language of popular theology, they do not materially differ from the evangelical denominations in their views of the great matters of Christianity. The following synopsis by Alexander Campbell is a fair expression of their sentiments on the points involved: "1. I believe that all Scripture given by inspiration of God is profitable for teaching, for conviction, for correction, for instruction in righteousness, that the man of God may be perfect and thoroughly accomplished for every good work. 2. I believe in one God, as manifested in the person of the Father, of the Son, and of the Holy Spirit, who are, therefore, one in nature, power, and volition. 3. I believe that every human being participates in all the consequences of the fall of Adam, and is born into the world frail and depraved in all his moral powers and capacities, so that without faith in Christ it is impossible for him, while in that state, to please God. 4. I believe that the Word, which from the beginning was with God, and which was God, became flesh and dwelt among us as Immanuel or 'God manifest in the flesh,' and did make an expiation of sin, 'by the sacrifice of himself,' which no being could have done that was not possessed of a superhuman, superangelic, and divine nature. 5. I believe in the justification of a sinner by faith without the deeds of law, and of a Christian, not by faith alone, but by the obedience of faith. 6. I believe in the operation of the Holy Spirit through the word, but not without it, in the conversion and sanctification of the sinner. 7. I believe in the right and duty of exercising our own judgment in the interpretation of the Holy Scriptures. 8. I believe in the divine institution of the evangelical ministry; the authority and perpetuity of the institution of baptism and the Lord's supper." With the Disciples the Christian faith does not consist in the belief of these or any other tenets as intellectual conceptions of religious truth, but in a simple trust or personal reliance on Christ as the Son of God and the Saviour of sinners.

They hence require of candidates for baptism no other confession of faith than this. As to government, each church is independent, but the churches coöperate with each other in sustaining Bible societies and missionaries at home and abroad. Two classes of officers are recognized, elders or bishops and deacons, who are chosen by the members of each church, and to whom the interests of the congregation are confided.—According to a denominational almanac for the year 1867, the number of members in the United States was estimated at 424,500, chiefly in the southern and western states, the largest numbers being in Virginia (15,000), Missouri (22,200), Kentucky (75,000), Ohio (52,000), Indiana (70,000), Illinois, (33,000), and Iowa (15,500). In 1872 their number was estimated at 500,000. The denomination had in that year one university, the Kentucky university, at Lexington, Ky.; colleges at Bethany, West Va.; Indianapolis, Ind.; Eureka and Abingdon, Ill.; Oskaloosa, Iowa; Wilmington, Ohio; Franklin, Tenn.; Woodland, Cal.; and Jeffersontown and Eminence, Ky.; female colleges at Columbia, Mo.; Versailles and Harrodsburg, Ky.; and Bloomington, Ill.; and 12 academies and seminaries. The periodicals of the denomination were 6 weekly, 2 semi-monthly, 16 monthly, 1 quarterly, and 1 annual. The number of Sunday schools was 2,450 with 253,290 scholars. Churches have been established in Canada, the British islands, the West Indies, and Australia; and the establishment of a mission in Germany was resolved upon in 1871.

DISCOPHORÆ. See JELLY FISH.

DISCOUNT, a sum of money deducted from a debt due at some future period, in consideration of immediate payment. In commercial transactions it is customary, when a bill is to be discounted, to pay to the holder or presenter the amount minus the simple interest calculated for the time the bill has to run. Thus a person holding a bill for \$100 payable in one year at 7 per cent. would receive \$93, which would be considered its present value. The true discount, however, of any sum for any given time, is such a sum as will in that time amount to the interest of the sum to be discounted. Thus, in the above instance, the sum to be deducted from the bill would be, not \$7, but \$6 54 and a fraction, which would amount at the end of a year to \$7. The true rule for computing discount would therefore be: As the amount of \$100 for the given rate and time is to the given sum or debt, so is \$100 to the present worth; or, so is the interest of \$100 for the given time to the discount of the given sum. Elaborate tables have been calculated on this principle, but as abatement of the simple interest is generally resorted to, they are of little practical value.—Discount on merchandise, sometimes called rebate, is a deduction from the price of goods sold on credit, when the buyer finds means to make his payment before the stipulated time.

DISINFECTANTS, substances used to counteract or destroy noxious odors and exhalations, or whatever may produce infection. The term is also made to embrace substances used to prevent decay of organic bodies. (See ANTISEPTICS, and EMBALMING.) In the present article disinfectants will be considered as agents for deodorizing and fumigating. As the causes of infection exist in the atmosphere, and are spread over wide districts, disinfectants properly include whatever is used to purify the air, and the term may even be applied to the means employed to prevent the formation of noxious miasmata, as to a proper system of drainage, the destruction by fire of vegetable matter exposed to decay, the thorough ventilation of buildings, the provisions for abundant supplies of pure air and light, and the free use of clear water for washing away unclean matters. No more powerful disinfectant exists than the fresh wind, which stirs up the infectious vapors, dilutes them with pure air, and sweeps them away. Violent winds, as hurricanes, are observed to arrest the progress of disease; efficient ventilation has in many hospitals mitigated it to a wonderful extent. The light and warmth of the sun have also an extraordinary influence in promoting health and vigor, and destroying some of the causes of injurious exhalations. Other agents are abundantly provided by nature which man may employ to remove infectious matters. They may be swept away by running water, or their gaseous emanations be absorbed by the earth in which they are buried. Exposure to heat may change their properties, or cause their elements to enter into new and harmless combinations; or by a freezing temperature decomposition may be arrested, and the formation of noisome gases prevented. Peat bogs present their antiseptic qualities as means of accomplishing the same end, and the astringent extracts of the bark of trees, such as are employed in tanning, possess the qualities of disinfectants.—In the selection and preparation of these agents, none is found more efficient than that which imitates the great natural disinfectant, a strong current of heated air. The method of artificially applying it to the removal of noxious effluvia from clothes and articles of merchandise has been patented in Great Britain; the articles are exposed in large chambers to rapid currents of air, heated from 200° to 250° F., the infectious matters being decomposed by the heat, or swept off in the hot blasts. Earth and porous bodies generally are employed to absorb injurious vapors; none possess this property in so remarkable a degree as charcoal. De Saussure found that a single volume of this substance, prepared from boxwood, absorbed 90 volumes of ammonia; of sulphuretted hydrogen it took up 55 times its own bulk; of carbonic acid, 35 times; of carbonic oxide, 9·42; of oxygen, 9·25; of nitrogen, 7·50; and of hydrogen, 1·75. Bodies of animals have been buried in charcoal powder,

which, while it did not prevent decay, still arrested all escape of disagreeable odors. The gases it retained indicated that it exerts an influence in causing the decomposition of the exhalations, and the combination of their elements to form new compounds with the oxygen of the air. Chlorine, which has for many years been in use in hospitals and other places exposed to noxious exhalations, acts as a powerful disinfectant by producing a chemical change in the injurious compounds, and also by arresting decay. It is generated by the decomposition of hydrochloric acid, which is effected by adding to it some black oxide of manganese. The chloride of lime, as it is commonly known, is the usual medium for distributing it, the gas being freely evolved on the exposure of the salt to the air. It is set free by the presence of any acid fumes, and as carbonic acid is evolved in the decomposition of organic matters, the noxious effluvia themselves provide one of the agents for their own disinfection. Vinegar or dilute sulphuric acid, however, added to the chlorinated lime, causes a more rapid evolution of the disinfecting gas. In consequence of the acid nature of the vapor, it should be used for fumigating rooms only when these are not occupied by invalids; and the same may be said of the disinfecting solutions, as the hypochlorite of soda, of which chlorine is the active agent. The more powerful fumes of nitrous acid, which possess the highest disinfectant qualities, are liable to the same objection; yet so important is their application regarded that Dr. Carmichael Smyth, who first proposed their use, received therefor from the British government the sum of £5,000. The unwholesome sulphuretted hydrogen is decomposed by these fumes, as it is by chlorine, the sulphur being set free and the hydrogen uniting with the disinfectants. In combination with some of the metals, chlorine has been much used as a disinfectant, especially with zinc, in the aqueous solution of the chloride of the metal, which is known as the disinfecting fluid of Sir William Burnett. Its use is somewhat objectionable, from its poisonous qualities. The same compound is advantageously applied to arresting dry rot in timber. Chloride of manganese is an efficient salt of similar properties, and, being the refuse of chloric manufacture, may be cheaply procured. Chloride of aluminum, under the popular name of chloralum, has recently come into use. The action of iodine is similar to that of chlorine, and more powerful. Its application is simple. The solid substance, exposed to the air in a plate, will disengage at ordinary temperatures sufficient vapor to exert a chemical action on deleterious organic compounds. Nitrate of lead has been recommended for its disinfectant properties, particularly in the solution known as Ledoyen's disinfecting fluid. It corrects the fetid odors of sulphuretted hydrogen and sulphuret of ammonium by decomposing those compounds, but it has no antiseptic prop-

erties, and is objectionable on account of its cost and poisonous nature. Sulphate of iron, which is used for the cleansing of sewers, drains, and soil pipes, depends for its efficacy upon a similar action, and upon its deoxidizing power. The permanganate of potassa is, under certain circumstances, an excellent disinfectant and deodorizer, readily parting with its abundant oxygen; but it is not volatile, and cannot be brought into efficient contact with large quantities of air, so that its action in purifying the atmosphere is insignificant. For washing dirty and decomposing surfaces, and for the disinfection of fluids, as bilge water, it has been found very effective. Sulphurous acid, including the sulphites and hyposulphites, which easily disengage it, is an exceedingly active substance in several ways; it is a deoxidizer, and has besides the power of destroying life in the lower organisms. Sulphurous acid may be generated by burning sulphur in the apartment to be disinfected, care being taken to remove anything which might be bleached by its action. It has been found, however, that although $\frac{1}{4}$ of 1 per cent. of sulphurous acid in the atmosphere is sufficient to prevent the action of yeast as a ferment, yet $\frac{1}{4}$ to $\frac{1}{2}$ of 1 per cent. is not enough to destroy colors. It cannot be conveniently used in inhabited rooms, on account of its irritant properties; although some physicians who have used it consider that its power of producing bronchial irritation has been exaggerated, and that patients may become well accustomed to it. The sulphites and hyposulphites may be used for the deodorization of stables and manure heaps; for this purpose they have the advantage of adding to the fertilizing value of the substances acted upon, by retaining the phosphoric acid and ammonia. These salts have been used as medicines for the purpose of destroying a hypothetical ferment in the blood. Carbolic acid and creosote are disinfectants which have been much used of late. They prevent putrefaction by killing the microscopic organisms that accompany this process. They have, however, but little power in preventing the action of emulsine on amygdaline, or diastase on saliva or starch; from which it may be inferred that the estimate of their action upon other fermentations has been somewhat exaggerated. Carbolic acid may be employed by vaporizing it from a hot plate or brick, by scattering a spray of its solution through the air and upon the walls, by placing open dishes filled with the acid or with carbolate of lime in localities to be disinfected, or by using dilute solutions to wash floors, &c. Its use in the surgical wards of hospitals has been said to diminish the mortality from infectious diseases, such as erysipelas and pyemia. Dr. Sansom has shown that in order to purify the atmosphere properly, and prevent the development of fungi, bacteria, and vibrios, and hypothetically of disease germs, it is necessary that the disinfectants should be volatile, as in the case of iodine and

sulphurous and carbohc acids. The others, however, may be used to prevent or arrest the development of injurious gases from decomposing solids and fluids, or to neutralize them when formed.

DISLOCATION (Lat. *dis*, apart, and *locus*, place), in surgery, that displacement in the osseous system which results from the direct application of force or other long continued cause. All the joints are liable to dislocation, but it most commonly occurs to those which possess the greatest mobility; hence the shoulder joint is the most frequent seat of this accident. The head of the humerus or bone of the upper arm, forming a ball-and-socket joint in connection with the scapula or shoulder blade, is regulated in its motions by very strong muscles, and is but slightly impeded in its free motions by the very shallow socket in which it rests. While this arrangement bestows great freedom of action upon this joint, it renders it liable to dislocation in almost every direction. The most common is that which occurs when the arm is elevated above the head, by means of which the head of the humerus is thrown into the armpit. Next in frequency is the dislocation of the hip joint, which is generally produced by a sudden blow upon the knee when the thigh is flexed toward the abdomen, whereby the head of the thigh bone is drawn backward by the action of the gluteal muscles upon the dorsum of the ileum or pelvis. The jaw bone is often thrown out of place in laughing, and much more frequently in yawning. This accident sometimes occurs while speaking under undue excitement. It may be easily remedied by placing the thumbs on the back teeth so as to press them downward while the chin is raised by the fingers slowly upward. Care should be taken, however, to remove the thumbs quickly on the restoration of the joint, or they may be painfully compressed between the teeth.—The chief difficulty in restoring a dislocation consists in the opposition offered by the muscles, rendered acutely irritable by the unnatural position of the head of the luxated bone. In some instances this is overcome by reducing the heart's action by general bleeding. The warm bath and emetics are likewise used to relax the muscles, and with the same view tobacco moistened with water is sometimes laid upon the abdomen until it induces sickness and a disposition to syncope. But the safest and most efficient means of securing complete relaxation of the muscles is probably the etherization of the patient; and in this way a dislocation may sometimes be reduced with the exertion of a comparatively slight degree of force. The surgeon in reducing a luxated joint endeavors, by a steady application of force exerted in the direction of the joint, either to fatigue the muscles, or seize some moment when they are relaxed to slip the bone into its socket. Various degrees of force and different appliances are used to effect this object. In the case of the shoulder joint

the surgeon frequently forms a lever of the arm, with the heel of his boot placed in the armpit for a fulcrum, and by pressing the arm inward over this toward the body, overcomes the resistance of the muscles, and restores the joint. In the case of the hip joint, the force required is necessarily more considerable, and pulleys are often resorted to, by which means not only a greater but a steadier traction is exerted. A recent dislocation is much more easily reduced than one of long standing; indeed, no time should be permitted to elapse between the accident and an attempt at its reduction, for every hour adds to the uncertainty of success.—In geology, the term dislocation is applied to the change in the position of rocks caused by their being torn from their original place, either by upheaval or subsidence.

DISMAL SWAMP, Great, a large morass in Virginia and North Carolina, extending 40 m. S. from near Norfolk in the former state, and 25 m. E. and W. The soil consists of black vegetable matter to the depth of 15 ft., saturated with water, yielding to the tread of man, and during a large part of the year covered in many places with stagnant pools. Several small streams flow through it, and in the centre is Lake Drummond, 6 m. long and 3 m. wide, the surface of which is 21 ft. above tide water. The swamp is for the most part covered with a dense growth of cypress, juniper, gum, and cedar, and upon the drier ridges that intersect it are found the beech and oak. Much of the most valuable timber, however, has been cut down, and large quantities have been obtained from beneath the surface, where the fallen trunks have been preserved by the wetness of the soil. The Seaboard and Roanoke and the Norfolk and Petersburg railroads pass through the N. border. The great channel of transportation is the Dismal Swamp canal, made by the assistance of the national government and the state of Virginia, which connects the W. branch of Elizabeth river with the Pasquotank. It is 6 ft. deep, supplied chiefly by Lake Drummond, with which it is connected by a feeder, and passes for 20 m. through the swamp, affording an outlet not only for timber but for much of the agricultural produce of the E. part of North Carolina. Steam power is used upon it, and the tolls amount to about \$20,000 a year. The Chesapeake and Albemarle canal also passes through the swamp, connecting the E. branch of Elizabeth river with Currituck sound, and admits vessels of considerable size. In 1870, 4,382 vessels of all classes passed through it, and the revenue from tolls and towage was \$58,734. This canal contains a single lock, 40 by 220 ft., and is fed by tidal action. Several minor canals connect the mainland with Lake Drummond. A stage road runs parallel to the Dismal Swamp canal from the N. border to Elizabeth City, N. C. Roads are made in the swamp by laying logs 8 or 10 ft. long side by side on the surface of the soil or "sponge." They are passable by mules and

oxen, but carrying is done mostly by hand to the creeks and ditches communicating with the canals.—The productions of the Dismal Swamp consist chiefly of ship timber, boards, shingles, staves, railroad ties, and fire wood. It is especially noted for its shingles. A large force of colored men is employed during the drier months of the year in preparing the lumber for market. Its dimensions were first accurately estimated by Col. William Byrd in 1728, while engaged in surveying the boundary of Virginia and North Carolina. An account of his passage through the swamp has been preserved in the Westover MSS.—Along the coast of North Carolina are the Little Dismal and several smaller swamps, covering in the aggregate about 2,000,000 acres. They were once noted retreats of runaway slaves. (See Bog.)

DISPENSATION, the act by which an exception is made to the rigor of the law in favor of some person. To make a dispensation is an attribute of sovereign power. In the United States no power exists, except in the legislature, to dispense with law, and then it is rather a change of the law than a dispensation.—In the Roman Catholic church a dispensation is an exemption from ecclesiastical law, granted by the proper authority for "just and reasonable causes." The pope alone, and the persons by him empowered, can dispense with the laws which bind the universal church. In local laws, whether national, provincial, or diocesan, the dispensing power resides in the bishops and in those deputed by them. The divine law and the law of nature, according to the church, cannot be dispensed with.

DISRAELI, Benjamin, an English author and statesman, eldest son of Isaac Disraeli, born in London, Dec. 21, 1804. His mother's maiden name was Basevi. He received his education at home from his father and from private tutors. An intimate friend of his father, an eminent solicitor, who had a great practice and no son of his own, wished to make Benjamin the heir of his business, and took him into his office for a time. But the young Disraeli did not like the life of a lawyer, and was not ambitious of success in that direction. He therefore abandoned the solicitor's office, with its brilliant prospect of wealth and reputation, and devoted himself to literature. His personal beauty, refined manners, and remarkable powers of conversation soon made him a favorite in society. At the age of 19 he visited Germany, and on his return to England published in 1826-'7 his famous novel "Vivian Grey," the chief characters in which were faithful pictures of himself and of persons well known in English society. The originality, vivacity, and wit of this book gave it great celebrity, and it was translated into the principal languages of Europe. It is said by several of his biographers that at this period he was made editor of a daily paper, called "The Representative;" but this is not true. In 1828 he published in one volume "The Voy-

age of Captain Popenilla," a gay and good-humored but flimsy satire, which met with little success. The next year he commenced an extended tour in Italy, Greece, Albania, Syria, Egypt, and Nubia, and returned in 1831. Shortly afterward he published his second fashionable novel, "The Young Duke;" and in the following year another novel, "Con-tarini Fleming, a Psychological Autobiography," which Heinrich Heine pronounced to be "one of the most original works ever written," and which received high praise from Goethe and from Beckford, the author of "Vathek." Its subject is the development of the poetical nature, and it contains brilliant sketches of Italy, Spain, Greece, Asia Minor, Syria, and Egypt. The author himself has said of it recently, "It would have been better if a subject so essentially psychological had been treated at a more mature period of life." At this time Disraeli made his first attempt to enter parliament. He presented himself to the electors of High Wycombe, Buckinghamshire, near his father's residence, as a tory-radical, and was defeated by the whig candidate. In December, 1834, he was again defeated in Wycombe. He next appeared in May, 1835, at Taunton, as a thorough-going conservative. It was on this occasion that, when charged by somebody in the crowd with "O'Connellism," he called the great Irish agitator a "bloody traitor;" to which Mr. O'Connell made the retort, "For aught I know, the present Disraeli is the true heir at law of the impenitent thief who died on the cross." Disraeli challenged O'Connell's son, Morgan O'Connell, who had taken up his father's quarrel; but the challenge was not accepted. In the mean while Disraeli wrote and published several books. "The Wondrous Tale of Alroy," an oriental romance of extraordinary eloquence and power, depicting the adventures of a prince of the house of David, who in the 12th century proclaimed himself the Messiah, and called the Jews of Persia to arms, appeared in 1833, accompanied by "The Rise of Iskander," a tale founded on the revolt of the famous Scanderbeg against the Turks in the 15th century; a political pamphlet entitled "What is He?" in 1834, in which he tried to explain his political views; "The Revolutionary Epic" and "The Crisis Examined" in the same year, and "A Vindication of the English Constitution" in 1835. In 1836 he published a series of letters in the London "Times" under the signature of "Runnymede," which were read with great interest on account of their remarkable wit and sarcasm. Toward the close of the same year he published a love story, "Henrietta Temple;" and in the spring of 1837 appeared "Venetia," a novel, in which he portrayed the characters and appearance of Lord Byron and Percy Bysshe Shelley. At last he achieved the great object of his ambition. In the first parliament of the reign of Victoria, being then 32 years of age, he

obtained a seat as representative of the conservative borough of Maidstone. His maiden speech was a failure. The house refused to listen, and clamored him down in the rude English fashion. He closed in the following words: "I am not surprised at the reception I have experienced. I have begun several times many things, and I have often succeeded at last. I shall sit down now; but the time will come when you will hear me." In July, 1839, this prediction began to be fulfilled; he made a speech which was listened to with attention, and praised for its ability. In that year he published his five-act tragedy, "Count Alarcos," founded on an old Spanish ballad, and in the same year contracted a most fortunate marriage with the wealthy widow of Wyndham Lewis, his friend and colleague in the representation of Maidstone. The happy influence of this union upon his career he has himself acknowledged in the graceful dedication of one of his novels to a "perfect wife." In 1841 he was elected from the borough of Shrewsbury, and in 1844 published "Coningsby, or the New Generation," which achieved great success and had a wide circulation. The cause of its extraordinary popularity, apart from its great literary merit, was the fact of its principal characters being drawn from well known persons then living. It was regarded also as an exposition of the views and designs of the famous half literary, half political party then attracting public attention under the name of "Young England," of which Disraeli was one of the most conspicuous leaders. In 1845 he published "Sibyl, or the Two Nations," which depicts with much care the condition of the English people at that period, and especially the Chartist agitation. In 1847 he was returned as one of the members for Buckinghamshire, and in the same year he published "Ixion in Heaven," with other tales, and also "Tancred, or the New Crusade," in some respects the best of his novels. He himself says in the preface to his collected works (1870), that "Coningsby," "Sibyl," and "Tancred" form a trilogy, the object of which was to delineate the origin and character of English political parties. He now began to take a leading part in the house of commons. His severe attacks on Sir Robert Peel, for alleged treachery to his party in the adoption of his free-trade policy, are among the most remarkable speeches in the annals of the British legislature. They established Disraeli's reputation as one of the most powerful debaters and keen and polished satirists in that body. In 1849 he became the recognized leader of the conservative party in parliament. A biography of his father, Isaac Disraeli (1849), and a memoir of his personal and political friend Lord George Bentinck (1852), were his next literary productions. In March, 1852, in the first Derby administration, he received the appointment of chancellor of the exchequer, was made a member of the privy council, and became

leader of the ministerial party in the house of commons. He went out of office with the rest of the Derby ministry in December of the same year. In February, 1858, when Lord Derby again accepted the task of forming a new cabinet after the downfall of Lord Palmerston, Disraeli again became chancellor of the exchequer. In February, 1859, he brought forward an elaborate plan of electoral reform, a principal feature of which was the extension of the suffrage to the whole body of the educated class without regard to property. The bill was defeated in the house of commons, March 31, and parliament was dissolved April 23. The Derby administration retained its place till June 11, when the new parliament passed a vote of want of confidence, and the ministry resigned. It was succeeded by the Palmerston-Russell cabinet, and on the death of Lord Palmerston, Oct. 18, 1865, by the Russell-Gladstone ministry, which remained in power till June, 1866, when, owing to the unsatisfactory nature of the reform bill proposed by them, a vote of want of confidence was passed, and they resigned. Disraeli during this period was the leader of the opposition in the house of commons. A new ministry was formed, July 6, the earl of Derby being prime minister and Disraeli chancellor of the exchequer. He was the chief supporter of the reform bill, signed by the queen Aug. 15, 1867, which extended the right of suffrage to all householders in a borough, and to every person in a county who had a freehold of 40 shillings. The earl of Derby resigning in February, 1868, Disraeli became prime minister; but a majority in parliament was opposed to the position which the ministry took on the question of disestablishing the church of Ireland. Parliament was dissolved, but the new elections showed a strong majority for the opposition, and without waiting for its meeting Disraeli with his colleagues resigned, Dec. 2, 1868, and was succeeded as prime minister by Mr. Gladstone. In 1870 Disraeli published "Lothair," a politico-religious novel, aimed at the Fenians, the Communists, and the Jesuits. It had a great success, its circulation in the United States alone exceeding 80,000 copies. In 1868 he was offered a peerage by the queen, which he declined for himself, but accepted for his wife, who was made Viscountess Beaconsfield on Nov. 28 of that year. She died Dec. 23, 1872. In February, 1874, the parliamentary elections having resulted in a conservative majority, Mr. Gladstone resigned, and Mr. Disraeli again became prime minister.—The career of Mr. Disraeli is one of the most extraordinary in English history. By genius and energy unaided by wealth or family connections, he has made himself leader of the house of commons, minister of finance in the most commercial of countries, and twice prime minister of one of the mightiest of modern empires.

DISRAELI, Isaac, an English author, born near Enfield in May, 1766, died Jan. 19, 1848,

His father removed to England in 1748 from Venice, whither his Hebrew ancestors had fled in the 15th century from the inquisition in Spain. In Venice they assumed the name of Disraeli (originally written D'Israeli), "a name never borne before or since by any other family, that their race might be for ever recognized." Isaac was an only son, and was intended for the pursuits of commerce, by which his father had attained to fortune. The latter was seriously alarmed when his son during his school days produced a poem; "the loss of one of his argosies uninsured could not have filled him with more blank dismay." He was sent to a college at Amsterdam, where he studied the philosophical works in fashion at the time, and when 18 years of age returned to England a disciple of Rousseau. When informed that a place in the establishment of a great merchant was prepared for him, he replied that he had written and intended to publish a poem of considerable length against commerce, which was the corrupter of man. Pensive and sensitive, fond of solitude and the society of books, he found no literary friend and counsellor, and was sent by his parents to travel in France, with the hope that adventures and change of scene might divert him from the eccentricity of his course. He lived in Paris, associating with learned men and frequenting libraries, till 1788. On his return he published anonymously in 1789 a satire "On the Abuse of Satire," in polished verses, which was directed against Peter Pindar, then in the height of his popularity. This venture obtained for him the friendship of Mr. Pye, afterward poet laureate, through whose influence the elder Disraeli was persuaded to renounce the effort to convert a poet into a merchant, and was finally induced to furnish means sufficient to enable his son to gratify his passion for book-collecting and for tranquil study. The son now wrote some metrical pieces for the magazines, and in 1790 "A Defence of Poetry," of which he afterward burned all the copies he could obtain. In 1791 he published the first, and in 1793 the second volume of his "Curiosities of Literature," a product of curious erudition, abounding in discursive and anecdotal criticisms. A new edition of both volumes appeared in 1794. This was followed by "Miscellanies, or Literary Recreations" (1796); "Vaurien, or Sketches of the Times, a Philosophical Novel" (2 vols., 1797); "Romances," a volume of prose tales (1799); "Narrative Poems" (1803); "Flim-Flams, or the Life and Errors of my Uncle, and the Amours of my Aunt" (3 vols., 1805); and "Despotism, or the Fall of the Jesuits," a novel (2 vols., 1811). In 1812 appeared his "Calamities of Authors, including some Inquiries respecting their Moral and Literary Character;" in 1814, "Quarrels of Authors, or some Memoirs for our Literary History, including Specimens of Controversy to the Reign of Elizabeth;" and in 1816, the most finished of his compositions,

"Illustrations of the Literary Character, or the History of Men of Genius, drawn from their own Feelings and Confessions." All of these works are amusing and anecdotal, and reveal the author not only as a literary antiquary, but as a man of humor, thoughtfulness, and elegant tastes. His "Curiosities of Literature" had reached the fifth edition, when in 1817 he added a new volume, containing more elaborate essays than the preceding; and the success of the publication was such that he rapidly produced three additional volumes. He was five years in the composition of his work on the "Life and Reign of Charles I.," which appeared in 1828-'31, and gained for him the degree of D. C. L. from Oxford. He had long meditated a history of English literature, for which all his previous writings had been preparatory; but in 1839 a paralysis of the optic nerve prevented him from pursuing his researches, and a selection from his numerous manuscripts was given to the public in 1841 under the title of "Amenities of Literature." During the latter part of his life he resided on his manor of Bradenham, Buckinghamshire. "He was," says his son, "a complete literary character, a man who really passed his life in his library. Even marriage produced no change in these habits; he rose to enter the chamber where he lived alone with his books, and at night his lamp was ever lit within the same walls. In London his only amusement was to ramble among booksellers; in the country he scarcely ever left his room but to saunter in abstraction upon a terrace, muse over a chapter, or coin a sentence." A new edition of his works, edited and annotated with a memoir by his son, Benjamin Disraeli, was published in London in 1850, and republished in New York in 9 vols.

DISSEISIN, a term used in the English law to express the turning a man out of possession of a freehold estate in lands, that is to say, an estate in fee or for life. It is not applied to dispossession of a term of years, nor is it strictly applicable to an incorporeal estate, inasmuch as that species of estate does not admit of actual possession in a literal sense; yet constructively there may be disseisin of incorporeal rights, as an office, rent, and the like. According to the old common law, disseisin always imported a wrongful putting of another out of possession. An entry by a stranger after the death of the owner of a freehold, and before the heir or devisee had taken possession, was called an abatement; an entry after the determination of a particular estate, before the person entitled to the reversion or remainder, was an intrusion; an alienation by a tenant for life for a longer term than he was entitled to convey was a discontinuance; and different remedies were necessary for the recovery of the possession while the old forms of real actions were in use. As disseisin commenced by a wrongful act of the disseisor, the person disseized could repossess himself by an entry

upon the lands; but if the disseisor died in possession, there could be no entry against his heir, but the rightful owner was then put to an action for the recovery of the possession. This rule, however, was subject to certain exceptions, as disability of the person entitled to make the entry; and finally by statute five years' possession by the disseisor before his death was necessary in order to take away the right of entry. It was required that the entry should be peaceable, for if force was used a summary process was given by statute to restore the possession to the person thus put out, although, as before supposed, his possession was wrongful, provided he or those from whom he claimed had held the premises three years. Possession, although not conclusive evidence of the right of property, was yet deemed of such importance that it could be the subject of an action without involving the question of the real ownership of the fee. The old forms of proceeding by writ of entry, assize of novel disseisin, and the like, were possessory actions. The title to the fee could be determined only by a writ of right or other analogous proceeding. A limitation of time was prescribed for the bringing of possessory actions, which has varied at different periods; but now, by statutes 3 and 4 William IV., c. 27 (1833), no entry can be made nor action brought but within 20 years after the right of entry or action accrued; descent cast (as it was called when the disseisor died in possession) is not allowed to defeat such entry or action, and all the real actions formerly used are abolished, except actions for dower, *quare impedit* (which relates to certain incorporeal rights), and ejectment, which last is the mode by which all titles to corporeal estates are now tried. In this country, these provisions have been long since generally adopted, and even greater changes made; and the term disseisin has been little used in American law, and merely as synonymous with dispossession.

DISSENTERS, the general name in England for those Protestants who differ from the established church in doctrine or ceremonies. The origin of dissent was in the reign of Edward VI. John Hooper was appointed bishop of Gloucester, but refused to swear obedience to the metropolitan or wear the episcopal robes. His views were opposed by Crammer and Ridley, and he was imprisoned for preaching them, but had many followers, who were called nonconformists. During the reign of Elizabeth several acts were passed against dissent, especially the "Act of Uniformity" (1558), which enforced severe penalties against any one conducting public service in any other manner than that prescribed by the "Book of Common Prayer." These acts were not altered under James I., and under Charles I. dissent was punished with increased severity. Upon the fall of the latter episcopacy was proscribed, and at first the Presbyterians, and afterward the Independents, had the ascendancy. Episcopacy was restored with Charles II., and a new

act of uniformity was passed in 1662. The "declarations of indulgence" of Charles II. and James II. gave temporary relief, but it was not until the revolution of 1688 that dissenters enjoyed any real toleration. After this the penal laws were gradually ameliorated. The test and corporation acts were repealed in 1828, admitting them to active citizenship; in 1836 the marriage law was modified so as to allow marriages to be solemnized in the presence of the district registrar; in 1860 an act was passed for the admission of children of parents not connected with the church of England to the endowed schools, where such connection is not expressly required by the endowment; in 1867 the former religious restrictions as to the lord chancellor of Ireland were removed, and it was made lawful for judicial or corporate officers to attend their places of worship in their official robes, and a new oath was provided in place of the former oaths of allegiance, supremacy, and abjuration; religious tests in the universities were abolished as to all lay students in 1871. The disabilities of dissenters at present are little more than such as are necessarily involved in the existence of the established church. In the 17th century the great classes of dissenters were the Presbyterians, Independents, Baptists, and Quakers. The most numerous now are the Methodists, who did not begin as avowed dissenters, and some of whom do not now avow dissent. There are several subdivisions of Methodists, and many minor bodies which may be considered as subdivisions of the leading denominations previously mentioned.—In Scotland the Presbyterian church is established by law, and before the separation of the Free church the largest class of dissenters was that generally called Seceders, originating in a separation from the established church in 1736. They were divided into Burghers, Anti-Burghers, Original Burghers, and Original Seceders. The most of the Burghers and Anti-Burghers united in 1820 under the name of the "United Associate Synod of the Secession Church;" and in 1847 this body united with the Relief church, which had seceded from the establishment in 1752, the aggregate body taking the name of the "United Presbyterian Church." In 1843 a very large secession, led by Dr. Chalmers, formed the Free church of Scotland, now much the largest body of dissenters there. These bodies differ from the church of Scotland only in regard to the relation of the church to the civil government. There are also many Congregationalists or Independents and Baptists in Scotland.—The disestablishment of the Episcopal church in Ireland in 1868 has made the term dissenters no longer applicable there.

DISSOCIATION, in chemistry, a term applied to the influence of heat and pressure on chemical action. The word was first employed by Henri Sainte-Claire Deville, who in November, 1857, read before the French academy of sciences a paper "On the Dissociation or Spon-

taneous Decomposition of Bodies under the Influence of Heat." He says: "By selecting a proper compound and heating it sufficiently, the distance between the molecules can be increased to such an extent that they will separate into their elementary condition. This is a spontaneous decomposition, not determined by any chemical action. I propose to call it the dissociation of compound bodies." In 1846 Grove showed that fused platinum could determine the decomposition of water into its elements. Deville repeated this experiment on a large scale by pouring fused platinum into water. He obtained an explosive mixture of hydrogen and oxygen, and believes that at the temperature of the fusion of platinum water is dissociated into its constituents. Analogous experiments can be performed on solids. Debray showed that when Iceland spar is heated in a tube from which the air has been exhausted, no decomposition takes place in mercury vapor at 350°C ., and a scarcely perceptible decomposition in sulphur vapor at 440°C .; but at 860°C . in vapor of cadmium it becomes very perceptible, and goes on till the tension of the liberated carbon dioxide becomes equivalent to 85 millimetres of mercury; on raising the temperature to 1042°C . in vapor of zinc, more carbon dioxide is evolved. If, on the other hand, the apparatus be allowed to cool, the carbon dioxide is gradually reabsorbed by the quicklime, and a vacuum is reestablished in the apparatus. Lamy has applied these results to the construction of a pyrometer for the measurement of high temperatures. The apparatus consists of a porcelain tube glazed on both sides, filled with pure carbonate of lime; one end of the tube is closed, the other connected with a manometer. By reading the volume of gas in the pressure gauge, and consulting the tables of tension, the temperature is determined. According to Deville, there is a tension of dissociation analogous to the tension of vapors, and the evaporation of a liquid or the decomposition of a carbonate is subject to the same laws. In Fownes's "Chemistry," the exceptions to the law of molecular vapor occupying twice the volume of hydrogen are explained on the principle of the dissociation of the vapors at the high temperature required for the determination of their vapor density. Several writers on geology, among them Fournet and T. Sterry Hunt, have had recourse to Deville's theory of dissociation to explain the origin of rocks and the action of forces in primeval chemistry. The force of chemical affinity appears to be suspended by great heat, so that at a high temperature, like that of the sun, we may imagine that chemical elements, such as oxygen, hydrogen, chlorine, and sodium, can exist in the gaseous state, intimately mixed, but chemically uncombined. Many of the phenomena attributed by Berzelius to catalytic action are now explained on the principle of dissociation. Since attention was called to the subject by

Deville, a large number of bodies have been investigated with reference to the tension of dissociation, and the doctrine has been pushed to the determination of the temperature of combustion, also to the better understanding of efflorescence and the phenomena of vaporization. The dissociation of carbonic acid was accomplished by Deville by heat; it has since been performed by Thénard by the electric current. Carbonic oxide, sulphurous acid, hydrochloric acid, ammonia, and hydriodic acid have been dissociated by various chemists. It is the opinion of Dumas that Deville's theory of the tension of dissociation is as important to chemistry as Dalton's law of the tension of vapors was to physics.

DISTILLATION (Lat. *destillare*, to drop), the conversion of a liquid or a solid into a vapor and condensing it; usually applied to liquids. If sea water is boiled, the vapor which passes off leaves behind the salts and other substances held in solution, and by condensation in the atmosphere, or against cool surfaces, is converted into drops of pure distilled water. By artificial processes of a similar nature a volatile liquid may be separated from one less so, as alcohol, acetic acid, or ether from water with which they may be mingled. The volatile principles of plants may be extracted by water or other liquids, and by distillation separated in a pure state, or dissolved in the liquid used for extraction. Solid vegetable and animal substances, by exposure to heat in vessels more or less closed, undergo a process in which the organic compounds are destroyed, and their constituents recombined, partly in the form of volatile products, which may be collected as distillates, and partly as non-volatile residuum. By subjecting wood to such a process, charcoal, tar, pyroligneous acid, and naphtha are produced; and by heating bituminous coal in close crucibles, illuminating gas, coke, coal, naphtha, and other products are separated. When solid substances, such as sulphur or camphor, are volatilized and condensed, the process, strictly speaking, is not distillation, because there is no collecting in drops; but it is called sublimation. In the chemical laboratory distillation is commonly conducted in glass retorts and receivers, the boiling taking place in the

FIG. 1.—Simple Distilling Apparatus.

retort and the condensation in the receiver, which is usually cooled by the application of water or ice to the exterior. The simplest apparatus of this kind is shown in fig. 1.

When large products are required, more efficient forms of apparatus must be employed. Such are stills, in which the retort as well as the condensing portion is made of metal, generally copper or iron. Usually, instead of a receiver of the ordinary form, the neck of the retort, or a tube from the boiler, is converted into a long coil, called a worm, which, being immersed in a tub of water, causes condensation of the vapors within. A simple form of still, often used when considerable quantities of distilled water are required, and also for other pharmaceutical purposes, is represented in fig. 2. The retort is all that portion of the apparatus which sets in and upon the furnace, including the neck *c*, terminating at *d*, in the worm *d, d*, which passes through a cooler *e*, which is supplied with cold water by the funnel *h*, the water entering at the bottom and flowing out at the top. It will be seen that the form of this apparatus will prevent some of the less volatile portions of

FIG. 2.—Still.

the liquid subjected to distillation from passing over, as they may with the application of much heat in the common retort in fig. 1, a considerable condensation taking place in the dome *b*. Liebig's laboratory distilling apparatus is constructed by passing the neck of a retort into a Liebig's condenser, which consists of a glass tube surrounded by a metallic one, of tin or copper, in the lower part of which water enters, flowing out at the top. The arrangement is on the same plan as the still in fig. 2, only instead of a worm there is a straight tube.—The preparation of an alcoholic liquor by separating the more volatile portions of the fermented juices of fruits and infusions of grains does not appear to have been understood by the ancients. Ure says: "It seems to have been invented by the barbarians of the north of Europe as a solace to their cold and humid climate, and was first made known to the south-

ern nations in the writings of Arnoldus de Villa Nova, and his pupil, Raymond Lully of Majorca." But there are now few nations above the condition of savages who do not prepare some kind of alcoholic liquors by distillation. The fermented juices of the grape and other fruits, and the fermented infusion of grape sugar derived from malted liquors, contain the same intoxicating principle, alcohol, which it is the object of distillation to obtain in a more condensed form, and which when so obtained from liquids of different qualities retains the peculiar aroma and flavor of the plant, until by repeated distillations and rectifications the pure alcohol is at last obtained from peculiar volatile oils or flavors. All the juices of plants which can undergo vinous fermentation, and all vegetable matters which contain starch, may thus be made to produce alcoholic liquors. Some animal fluids also, which contain saccharine matters, as milk, may be made to furnish alcohol by fermentation and distillation. An intoxicating liquor from this source, called *kumiss*, is made in Tartary, both simply fermented and distilled. The fruits of each country furnish spirits of their peculiar flavors when these are obtained directly from the fermented juice; but if this is first allowed to crystallize, the sugar so obtained, on being redissolved and fermented, is found to have lost the aroma of the plant. Thus, the high flavor of the rum which is distilled from fermented fresh cane juice is not found in the distillate from fermented sugar and molasses. Sugar-growing countries produce rum, vine-growing countries brandy, and grain-growing countries whiskey and gin. The Chinese manufacture a distilled liquor from rice, and the inhabitants of Kamtschatka another from mushrooms. The processes of obtaining these liquors are essentially the same, except that the cereals require some preparatory operations before they are ready, like the saccharine juices, for fermentation, and these operations are almost identical with those employed in brewing ale; the only difference being that in preparing the wort which after fermentation is to be distilled, the action of the diastase in the malt is continued until the dextrine is transformed into grape sugar. The grain is subjected to the process of mashing, and the resulting wort to that of cooling and fermentation, after which follows the distillation.—A brief account of the manufacture of whiskey, as performed in the great distilleries of Scotland, will sufficiently explain the various operations. Barley is commonly used as the starchy material, and is more or less mixed with oats, rye, or other grains. It may be malted wholly or in part, or may be used with sugar. Barley malt is the best material, but the heavy duty imposed upon it restricts its use. According to Dr. Thomson, 40 bushels of ground barley are mixed with 20 bushels of bruised malt, in a mash tun of cast iron, together with about 750 gallons of water,

at a temperature of about 150° F. The mashing is continued one hour and a half, during which time 500 gallons more of water at 190° to 205° are introduced at intervals, to keep up the heat. The whole is then allowed to infuse two hours, during which time the grain subsides, and the liquid above it is a saccharine turbid fluid, called wort, which also still contains some starch and dextrine; but these by the action of the diastase are gradually converted into grape sugar. At the end of the two hours' infusion the greater part (usually about two thirds) of the wort is drawn off, and 500 gallons of water at 190° is added, and the infusion is renewed and continued another hour and a half. After the wort is again drawn off, a third infusion succeeds, with 800 gallons of boiling water. This being well stirred for 20 minutes, and then left about half an hour, the saccharine matters are found to be extracted. The weak wort is then drawn off and boiled down to the required strength, or it is added to the first and second worts, or is kept to be used instead of pure water for the first infusion of the next mashing. Strong worts are not desirable, the fermentation being more complete and the yield of spirits greater when they are of moderate specific gravity. By the old excise laws of Great Britain they were required to be of a certain high degree of strength, but in Scotland and Ireland they are now allowed to range from 1030 to 1080 sp. gr., water being 1000. The next process is that of cooling the worts, and in consequence of the tendency of those produced from raw grain to become acid, this must be rapidly accomplished. In some distilleries the wort is run into large shallow coolers in airy situations in the upper part of the building. In others the cooling is done by a more compact form of refrigerator, a description of which is given in the article BREWING. The temperature is usually reduced to between 70° and 75°, when the worts are transferred to the fermenting tuns, and yeast is added in the proportion of about one gallon to 100 gallons of wort. The object of fermentation is to convert all the saccharine matter, if possible, into alcohol and carbonic acid; but the presence of the alcohol as it is formed impedes the progress of this change, and a quantity often amounting to one fifth of the whole saccharine matter escapes decomposition. By the invention of Mr. Sheridan in fermenting the wash in close tuns, and causing the alcohol to evaporate by using a powerful air pump, the whole saccharine matter was converted into alcohol; but the excise restrictions prevented the adoption of the improvement. As the fermentation proceeds the liquor attains a less specific gravity, and when successfully conducted its density gets to be the same as that of water. If it is pushed too far, or goes on sluggishly or at too high a temperature, loss will result by a portion of the alcohol passing to acetic acid, the presence of which is indi-

cated by increased specific gravity, as well as by its peculiar odor and taste. The process of distillation, which, by distinguishing the preparation of ardent spirits from that of fermented liquors, gives its name to the whole operation, now succeeds the fermentation. It is conducted in stills of various sizes and forms, some of which have a capacity equal to distilling from 2,000 to 3,000 gallons of wash per hour. The origin of the first still which abolished to a great extent the use of the worm and substituted condensing vessels, which principle has been retained with modifications in nearly all subsequent inventions of the kind, is due to a Frenchman named Édouard Adam, who is said to have been a distiller, unacquainted with anything more than the routine of his trade. In 1801 he witnessed some experiments with a Woulfe apparatus at a chemical lecture in Montpellier, and was so impressed with its advantages that he soon after constructed a still upon the same prin-

FIG. 3.—Édouard Adam's Still.

ciple. This succeeded so well that the whole process of distillation was soon completely changed. The uses of Woulfe's apparatus are described in the article on GAS, and by referring to that it will be seen that Adam's still was one of the happiest adaptations of a laboratory appliance to a manufacturing purpose. The modification of it as made by M. Adam is represented in fig. 3. A number of egg-shaped copper vessels, corresponding to the Woulfe bottles, are placed in convenient situations near each other, the terminal ones being connected on the one hand with the retort or boiler containing the fermented liquor or wine, and on the other with a worm which is immersed in a cooler. The neck of the retort passes into the first egg-shaped vessel, dipping below the surface of the liquor. It is perforated at its termination with minute holes through which vapor passes. A pipe from the first egg leads to the second, also dipping beneath the surface of the liquor, and so on, from one to the next, whatever the number may be. From the last egg a tube enters the globe B before

passing into the worm, whose use will presently be explained. From next to the last egg, or from any one of the series, an extra tube, C, also passes into the globe B, by which arrangement one or more of the eggs may be dispensed with when the distillation does not need to be carried very high. Another pipe, D, connects each egg and also the boiler with a small worm, V, which is used for testing the strength of the distillate in any one of the eggs, or from the boiler. Another pipe, E, leads from the cooler F into the boiler, and another, H, into the cooler from the storehouse where the wines are kept. The worm in the cooler F, moreover, leads into another worm in the cooler G. This still is worked in the following manner: The cocks connecting the upper tubes are closed, and those in the lower pipe, E, are opened. The wine is pumped from the storehouse through the tube H into the cooler F, whence it flows into the boiler. When this is about two thirds full the cock next it is closed, and the wine is forced up into the first egg; when this is about half filled the cock next it is closed, when the second egg is treated in the same manner; and so on through the series, except the last one, which serves as a condenser and is surrounded with cold water. The lower cocks are now closed, and the upper ones communicating between the eggs, and with the worm, are opened. Heat is applied to the boiler, and the mixture of alcoholic and watery vapor is carried into the first egg, and there condensed by the wine, quite rapidly in the beginning of the process, so that for a time no vapor passes over into the second egg. The wine in the first egg, however, gradually comes to its boiling point, which, by reason of its containing more alcohol than that in the boiler, is at a lower temperature. In consequence, the vapor which passes into the second egg has a greater percentage of alcohol than that which it received. This vapor, being condensed, will cause the liquor in the second egg to be stronger than in the first, and therefore to boil at a still lower temperature. The successive eggs, as they recede from the boiler, will thus contain stronger and stronger spirits, so that the last one may be made to receive alcoholic vapor of any desired strength. This is passed into the worm in F and condensed either in that or in the succeeding worm in the tub below, which is filled with water, kept cool by a constant flow. The upper cooler, containing the wine, is kept closed, except that a pipe leads into the globe B. This arrangement is for the purpose of preventing loss of spirit by evaporation, which would be considerable at the temperature it attains by contact with the worm. The excise laws of Great Britain prevented the introduction of this still into that country until after their modification in 1815. Adam's apparatus was in the mean time much improved in France by Isaac Bérard, Cellier-Blumenthal, and Derosne. The modification of Cellier-Blumenthal, im-

proved by Derosne, and now called Derosne's still, is represented in fig. 4. It consists of two boilers, A, A'; a first rectifier, B; a second rectifier, C; a wine heater, D, containing a dephlegmator; a condenser, F; a supply regulator, E, for controlling the flow of wine from the reservoir G, which is accomplished by means of a floating ball. The still is worked in the following manner: The boilers are about two thirds filled with wine, or the liquor to be subjected to distillation,

FIG. 4.—Derosne's Still.

through the cocks *c, c'*. The proper quantity is indicated by the glass gauges *d, d'*. Wine from the reservoir G is then let into the funnel J, by which the condenser F and the wine heater D are filled. On the application of heat the low-wine vapors pass from the lower into the upper boiler through the pipe Z, the extremity of which is enlarged and perforated with small holes. Here the vapors are condensed, increasing the strength of the wine in

the upper boiler, and consequently lowering its boiling point. The vapors ascend into the rectifiers B and C. The lower rectifier, B, contains a number of shallow pans perforated with holes, and a number of spherical disks, also perforated with holes, placed above them, in pairs, the convexity of each disk being upward, and receiving the drip of the shallow pan next above it. This drip is produced by warmed wine which flows from the wine heater through the pipe L. By these means the vapors ascending from the upper boiler have their more watery portions condensed, while the alcoholic vapor continues to ascend. The dripping wine also has a portion of its alcohol expelled in the form of vapor, which ascends with the vapor coming from below into the upper rectifier through the orifice O in its bottom. This upper rectifier communicates through the tube M with a worm (which is the dephlegmator) in the wine warmer D, the worm ending in the tube *m*, which again terminates in the worm contained in the condenser F through a cylindrical connection in its upper part. The worm in F terminates in a small vessel, N, which is furnished with an alcoholometer. The alcohol in N flows from its upper part into the cistern H. The upper rectifier C is divided into a number of compartments by as many horizontal partitions, each disk having an orifice in its centre, like the orifice at O. To each of these orifices on the upper side of the partition is adjusted a short open vertical tube. A short distance above each tube is placed an inverted pan, having its edges descending about three fourths of an inch below the level of the upper orifice of the tube. As the vapors ascend from the lower rectifier into the upper one, a portion of them condense and collect upon the bottom of the compartments until they rise slightly above the edges of the inverted pans and nearly to the upper orifices of the tubes. When this takes place the vapor can only pass upward by forcing its way under the edges of the pans, by which means the more watery portion is still further condensed, the more alcoholic vapor, having a higher tension, retaining its gaseous form, and passing on through the tube M into the dephlegmatory worm in the wine heater, there to be partially condensed; which process heats the wine surrounding the worm. A phlegma collects in the lower convolutions, which may be drawn off by means of the pipes *p, p, p*, and transferred at pleasure either into the tube *m* or into the upper rectifier. The purer alcoholic vapors which arise pass through the dephlegmator into the condensing worm in the condenser F, whence they flow in liquid form into the vessel N, and thence into the cistern H. The strength of the alcohol produced by this still depends upon the number of windings of the dephlegmator, and the number of partitions in the upper rectifier. Derosne's still requires but little fuel, distils rapidly, and yields a good spirit,

which may be varied in strength at pleasure; but it is rather complicated, and may with advantage, especially when spirits of only one strength are required, be replaced by a simplification of it, devised by Laugier.—The products of the stilleries of different localities are distinguished by peculiar flavors which give them a reputation; but they are not always, especially when the liquor is made from cereals, derived from the original qualities of the materials, but often from the fuel used in drying the malt. Much of the Scotch and Irish whiskey possesses the peculiar flavor of peat smoke. Brandies manufactured from wines are made to retain their peculiar flavors by conducting the distillation at a temperature sufficient to carry over the volatile oils and ethers, and also enough water to reduce the strength considerably below that of ardent spirits produced in Great Britain; but they may be given strength by the addition of pure spirit.—Common alcohol is the hydrated oxide of ethyle, or ethylic alcohol, $C_2H_5O + H_2O = C_2H_6O$. In the process of vinous fermentation there are formed, under conditions which are not yet clearly understood, other homologous alcohols, such as propylic, butylic, and amylie alcohols, in greater or lesser quantities. They have a higher boiling point than ethylic alcohol, and therefore do not usually appear in the first products of distillation; but in the latter stages of the operation, when the heat is raised, they pass over into the worms or condensers. These alcohols, mixed with some ethylic and small quantities of various ethers and volatile fatty acids, such as capric, caprylic, and formic, constitute an oily substance which passes under the general name of fusel oil. That of potato spirit consists almost wholly of amylie, combined with a small quantity of ethylic alcohol. This fusel oil imparts a very disagreeable taste to spirits, and to get rid of it is often a matter of importance. The process is called rectification, and may be conducted with or without redistillation. Its complete removal by distillation, even with the use of alkalies and other substances, is somewhat difficult and expensive, notwithstanding that the boiling point of absolute ethylic alcohol, 173° , is much lower than that of the others, amylie alcohol boiling at 270° . It is found, however, that an elimination can be satisfactorily effected by filtration through granulated charcoal which has been recently heated.—About three fifths of the products of distillation in the United States are what are termed high-wines or whiskey, containing about 75 per cent. of alcohol. This, as it comes from the still, contains a good deal of fusel oil. Some of it is made into cheap whiskey, and the remainder is rectified and redistilled into French spirit. When the percentage of alcohol is high it forms Cologne spirit. About one fifth of the products of distillation is alcohol, which is all used for manufacturing and mechanical purposes, about 6,000 barrels being exported from the United States monthly. The remaining

one fifth of the distilled liquors consists of whiskey and rum, distilled to about proof, and so left to ripen with age. Considerable whiskey is made from rectified spirits of about 75 per cent. alcohol, which is reduced and flavored by the addition of raw whiskey not rectified. All distilled liquors are sold by the gallon, according to the proof. Proof spirit is reckoned by the government as 100, which is 50 per cent. absolute alcohol.—

DESTRUCTIVE DISTILLATION. When organic bodies are excluded from the air and subjected to heat, they undergo decomposition, and the constituent atoms or molecules rearrange themselves into new compounds. The causes of this are various, and depend much upon the conditions which are present. The elective affinities of atoms and molecules, when a variety of substances are mingled together, vary with the heat and with the nature of the substances with which they are surrounded. Two or more elements united in a compound, requiring a certain degree of heat to separate them, will require less when another compound is present, the amount depending upon the affinity which a constituent of one compound may have for a constituent in the other. Organic bodies, which are usually composed of several compound constituents (as woody fibre, starch, resin, oils, and water), very readily suffer a complete change in their chemical as well as their organic structure by the simple application of heat, and without the presence of a supporter of combustion. When wood is enclosed in an iron tube and subjected to heat, various new bodies are formed of an inorganic character, and of a composition and number depending upon the duration and degree of heat. Decomposition commences at about 284° F.; and between this and red heat various gases, vapors, liquids, and solids are produced. The products of the lowest temperature contain the most oxygen, as water and carbonic and acetic acids. As the temperature rises bodies containing less oxygen are formed, such as wood spirit, acetone, and creosote. At a still higher temperature, hydrocarbons, such as toluene, xylene, eupione, and paraffine, appear; and as the temperature approaches redness, hydrogen is abundantly formed. By connecting the retort with condensing vessels, by means of good-sized exit tubes, the various volatile products may be collected, and subsequently separated by fractional distillation and otherwise. The manufacture of illuminating gas illustrates the destructive distillation of bituminous coal on a large scale. The products may be divided into three classes, viz.: 1, coke, consisting of carbon, sulphuret of iron, and ash; 2, ammoniacal liquor, containing carbonate, sulphide, chloride, cyanide, and sulphocyanide of ammonium; 3, tar, embracing a great variety of solid and fluid hydrocarbons and acids, among which are benzole, toluole, xylene, naphthaline, anthracene, and carbolic or phenic, oxyphenic, and cresylic acids, together

with creosote, a compound of homologous oxyphenic and methylic acids; also several bases, as aniline, iridoline, and rubidine; 4, illuminating gas, containing light-yielding compounds, such as acetylene, C_2H_2 ; ethylene, or olefiant gas, C_2H_4 ; benzole, C_6H_6 ; naphthaline, $C_{10}H_8$; propylene, C_3H_4 ; butyle, C_4H_6 ; mingled with hydrogen, carbonic oxide, and impurities, such as carbonic acid, ammonia, cyanogen, sulphocyanogen, and sulphuretted hydrogen. These processes involve highly complex reactions, the many stages of which are yet imperfectly understood. The destructive distillation of acids and the simpler bases are more easily understood, the products being often readily traced to their origin. The decomposition of the acids takes place differently according as they are separate or in the presence of bases. When distilled alone many undergo a simple elimination of carbonic acid, with the formation of a pyro-acid. Thus, gallic acid, when heated in a close vessel to 419° F., is decomposed into pyrogallal and carbonic acids, as follows:

Other reactions are not quite as simple. Thus, oxalic acid yields water, carbonic acid, carbonic oxide, and formic acid, as follows:

As an example of the destructive distillation of a salt, may be taken that of acetate of lime, which is converted into acetone and carbonate of lime, thus:

—**FRACTIONAL DISTILLATION** is the separating of different constituents which naturally exist or have been artificially produced in a mass. This is accomplished quite readily on account of the different temperatures at which the various constituents pass into vapors. The refining of petroleum is an example of fractional distillation. (See **PETROLEUM**.)

DISTRESS (Lat. *distringere*, to press, straighten, wring out), a term applied to the taking of property of a tenant for non-payment of rent; to the seizing of cattle for damage done by them; to a levy upon property to enforce the payment of taxes; and lastly to a proceeding to compel the appearance of a party who cannot be found. In the two cases first mentioned, the landlord or person who had been injured could make the seizure himself or by his deputy; an anomalous authority, entirely at variance with a fundamental principle of law that parties should not be permitted to redress their own injuries without judicial process. The recaption of property which has been wrongfully taken away, or wrongfully detained, or the reentry upon lands of which a man has been dispossessed, though analogous in one respect to distress for rent or *damage*

feasant, yet differs in another, viz.: that such recaption or reentry cannot be made with force, whereas a distress may be executed in like manner as process upon a judgment; that is to say, force may be used in case of resistance. The third case above mentioned, viz., distress to enforce the payment of taxes, is statutory, and while generally limited to the seizure and sale of the goods of the person taxed, it is sometimes, in the case of tax upon lands, permitted to extend to any personal property found thereon. The case of distress to compel an appearance was by a judicial writ called a *distingas*. In a popular sense, a distress is understood only of the taking property of a tenant or wrong doer in satisfaction of rent or damages. The term is with some incongruity applied as well to the property taken as to the act of taking. Formerly, the property distrained was deemed a mere pledge, and the distrainer had no power over it except that of detaining it till he received satisfaction of the rent or damages for which the distress was made; but for the security of the owner it was required that the property should be kept in a pound (*parcus*, which signifies any enclosure); and if the distress consisted of live animals, it was required that they should be impounded within three miles of the place where they were taken. If put into a public pound, the risk and expense of keeping the same devolved upon the owner without notice from the distrainer. By statute 11 George II., c. 19, the distrainer was authorized to make a special pound upon the premises where the distress was taken, in which case notice to the owner was required; but the liability to provide necessities for animals belonged to the owner as in the other case. A distress of chattels which might be injured by exposure to the weather the distrainer was bound to keep in a pound covert. A distress was allowed only by daylight, except in the case of beasts *damage feasant*, which might be taken at night, lest they should escape. Formerly the landlord could distrain only such goods as were found upon the premises for which rent was due, but by statute goods which have been clandestinely removed may be followed within 30 days after the rent accrues. In making the distress the landlord is not permitted to break open the outer door of the house, but being once in, he can break an inner door; being the same rule as in levy upon execution. As to the property subject to distress, it may be said in general that anything found upon the premises may be taken, whether the property of the tenant or not; but from this are excepted things affixed to the freehold and constituting a part of it in law; perishable articles; goods of third persons upon the premises from necessity, or for the purposes of commerce or trade, as the carriage of a traveller at an inn, or the plough at a smith's for repair; goods already in the custody of the law; and goods specially exempt

by statute. The tools or implements of a man's employment are also at common law conditionally exempt; that is to say, they should not be taken if other sufficient distress can be found. If distress is made when no rent is due, the tenant has his remedy by replevin; but for an excessive distress, the only protection of the tenant is by an ancient statute (52 Henry III., c. 4), under which an action may be brought for the taking of an unreasonable or excessive amount. After the impounding of the property, by the ancient law the remedy of the distrainer ceased; but by various modern statutes, when the distress is for rent, it may be sold after the expiration of five days for payment of the rent.—In the United States a strong inclination has of late been manifested to abolish distress entirely, not only as a harsh remedy as regards the debtor, but because establishing an unjust discrimination in favor of the landlord as against other creditors. In several of the states this has already been done.

DISTRICT OF COLUMBIA, a territory of the United States, containing the national capital. It is about 200 m. from the ocean by the Potomac river and Chesapeake bay, and lies between lat. 38° 51' and 39° N., and lon. 76° 58' and 77° 6' W. It was named in honor of Christopher Columbus, and also with some reference to the poetical use of the term Columbia as a designation for the United States. It is bounded on the S. W. by the Potomac, and on all other sides by Maryland, and is 10 m. long from N. W. to S. E., with an area of 64 sq. m. It formerly constituted the county of Washington, that term, however, being popularly confined to the portion outside of the cities of Washington and Georgetown, forming much the larger part of the District. The following table shows the population at the several decennial enumerations:

CENSUS.	White.	Free colored.	Slave.	Total.
1800.....	5,672	400	2,072	8,144
1810.....	10,845	1,527	3,554	15,471
1820.....	16,078	2,753	4,520	23,351
1830.....	21,152	4,004	4,505	30,261
1840.....	28,926	6,499	3,820	39,245
1850.....	37,941	10,059	3,657	51,657
1860.....	60,738	11,131	3,185	75,054
1870.....	88,278	43,404	131,700

Included in the total for 1870 are 3 Chinese and 15 Indians. There were 31,622 male citizens of the United States 21 years old and upward; 115,446 were native and 16,254 foreign born; 62,192 were males and 69,508 females. Of the natives, 52,340 were born in the District, 23,596 in Virginia and West Virginia, 21,751 in Maryland, 4,597 in New York, 4,121 in Pennsylvania, 1,254 in Massachusetts, and 1,042 in Ohio. Of the foreigners, 8,218 were born in Ireland, 4,020 in Germany, and 1,422 in England. There were 15,207 persons born in the District living in other parts of the Union. Of the colored, 35,372 were blacks

and 8,032 mulattoes. There were 28,719 persons 10 years old and over unable to write, of whom 26,501 were native and 2,218 foreign; 4,876 were white and 23,843 colored; 11,418 were male and 17,301 female; 22,112 were over 21 years of age, and 6,607 between 10 and 21; of those over 21, 1,214 were white males, 2,542 white females, 7,599 colored males, and 10,757 colored females. There were 78 blind, 134 deaf and dumb, 479 insane, and 50 idiotic; 303 paupers received support during the year; and 145 persons were convicted of crimes. There were 25,276 families, averaging 5.21 persons, and 23,308 dwellings, averaging 5.65 persons to each. There were 1,365 persons over 10 years of age engaged in agriculture, 29,845 in professional and personal services, 6,126 in trade and transportation, and 11,705 in manufactures and mining.—The surface is undulating, with hills which command extensive views and afford fine sites for public edifices. Two considerable streams empty into the Potomac within the District, Rock creek and the Anacostia or Eastern branch. There are also several small brooks, to one of which the name of the Tiber was given in the 17th century, because a planter named Pope lived near it. The climate is moist and warm, and there is much local miasma. In the summer and autumn fevers prevail in some parts, especially in the low grounds near the Potomac. The mean temperature of Washington in spring is 54.2°, in summer 73.1°, in autumn 53.9°, in winter 33.9°; year, 53.8°. The average rainfall in spring is 10.45, in summer 10.52, in autumn 10.16, in winter 11.07; year, 41.20 inches. The whole number of deaths in 1870 was 2,015, of which 826 were from general diseases, 280 from diseases of the nervous system, 80 of the circulatory, 237 of the respiratory, 356 of the digestive system, 77 from accident and injuries, and the rest from various causes. Consumption proved fatal in 442 cases, pneumonia in 123, and cholera infantum in 150. The soil is light and moderately fertile. In 1870 there were 8,266 acres of improved land. The productions were 3,782 bushels of wheat, 3,724 of rye, 28,020 of Indian corn, 8,500 of oats, 27,367 of Irish and 5,790 of sweet potatoes, 40 of peas and beans, 2,019 tons of hay, 126,077 gallons of milk sold, 900 of wine, and 4,495 lbs. of butter. There were 533 horses, 124 mules and asses, 657 milch cows, 144 other cattle, 604 sheep, and 577 swine; there were besides 5,496 horses and 1,000 cattle not on farms. The cash value of farms was \$3,800,230; of farming implements and machinery, \$39,450; wages paid during the year, including value of board, \$124,338; estimated value of farm productions, including betterments and additions to stock, \$319,517; of orchard products, \$6,781; of produce of market gardens, \$112,034; of live stock, \$114,916. There were 952 manufacturing establishments, with 54 steam engines of 789 horse power, and 15 water wheels of 1,100 horse power, em-

ploying 4,685 hands, of whom 4,333 were males above 16, 216 females above 16, and 136 youth; capital invested, \$5,021,925; wages paid during the year, \$2,007,600; value of materials, \$4,754,883; of products, \$9,292,173. The commerce, almost entirely domestic, is carried on chiefly through Georgetown. For the year ending June 30, 1872, there were entered in the coastwise trade 231 steam vessels of 109,681 tons, and 96 sailing vessels of 22,245 tons; cleared, 108 steamers of 69,308 tons, and 65 sailing vessels of 13,402 tons; registered, enrolled, and licensed, 419 vessels, with an aggregate tonnage of 26,623, of which 25, of 5,084 tons, were steam vessels; 103, of 2,987 tons, sailing vessels; 275, of 17,778 tons, canal boats; and 16, of 774 tons, barges. There were 31 vessels, of 1,352 tons, built during the year. The Chesapeake and Ohio canal passes through a portion of the District, and crossing the Potomac at Georgetown terminates at Alexandria. Branches of the Baltimore and Ohio railroad from Relay, and from Point of Rocks, Md., terminate in Washington, and a railroad connects Washington with Alexandria. The Baltimore and Potomac railroad connects Baltimore and Washington. There are 5 national banks with \$1,531,000 capital, 3 savings banks, 1 safe deposit company, 6 fire insurance companies with a capital of \$1,725,000, and 2 life insurance companies.—By the act of congress of Feb. 21, 1871, all the territory included within the limits of the District was erected into a government, by the name of the District of Columbia, which is constituted a body corporate, with the usual powers, for municipal purposes. The executive power is vested in a governor and secretary, appointed by the president, with the advice and consent of the senate, for four years; and in a comptroller, collector, auditor, treasurer, attorney, register, superintendent of assessments and taxes, water registrar, and surveyor, appointed by local authority. The board of health consists of five members, and the board of public works of four, besides the governor *ex officio*. There is a metropolitan police force for the District, under the charge of five commissioners, together with the governor *ex officio*. The commissioners and members of the boards are appointed in the same manner as the governor. A fire department has been organized by the territorial government. The legislative power is vested in an assembly, consisting of a council of 11 members, appointed by the president with the advice and consent of the senate, for a term of two years, and a house of delegates of 22 members, elected annually by the people. Two of the councilmen must be residents of and appointed from Georgetown, and two from that portion of the District outside of Georgetown and Washington. The territory is divided into districts for the appointment and election of councilmen and delegates. All male citizens 21 years of age, except convicts and those of unsound mind, who have resided one

year in the District and 30 days in the precinct where they offer to vote, have the right of suffrage. The assembly has power to divide the territory not included in Georgetown and Washington into not more than three townships, and is required to maintain a system of free public schools. The governor has a veto upon all legislative acts, which may be overcome by a two-thirds vote of each house. The supreme court of the District consists of a chief justice and four associate justices appointed by the president with the advice and consent of the senate, who hold office during good behavior, and has general original jurisdiction in law and equity, and appellate jurisdiction of judgments of justices of the peace. It is divided into a circuit court (having also the powers and jurisdiction of a circuit court of the United States) for the trial of civil causes by jury; a criminal court; a district court, with the powers and jurisdiction of a district court of the United States; and a special term for equity and probate matters; each of which is held by a single justice. The general term, held by all the justices or a majority of them, hears appeals and writs of error from determinations of a single justice. From final judgments and decrees of the supreme court a writ of error or appeal lies to the supreme court of the United States. Justices of the peace are appointed by the assembly, and have jurisdiction of minor cases. The salaries of all officers appointed by the president are paid by the United States; the other officers are paid from the local treasury. The property of a married woman, not received by gift or conveyance from her husband, is not subject to his control nor liable for his debts, and she may dispose of it in every respect as if single. The valuation of property, according to the federal censuses, has been as follows:

YEARS.	ASSESSED VALUE.			TRUE VALUE.
	Total.	Real estate.	Personal estate.	
1850...	\$41,084,945	\$33,097,542	\$7,987,403	\$14,018,874
1860...	\$41,084,945	\$33,097,542	\$7,987,403	\$14,018,874
1870...	74,271,693	71,437,468	2,834,225	126,873,618

At the last named date the total taxation was \$1,581,569, of which \$49,975 was county and \$1,531,594 city tax; there was a city debt of \$2,596,545, for which bonds to the amount of \$1,640,584 had been issued. The assessed value of real estate for the fiscal year ending June 30, 1873, was \$87,869,924; the valuation of Washington city was \$72,880,380; of Georgetown, \$6,366,488; of the county of Washington, \$8,623,056. The assessed valuation for the year ending June 30, 1874, was \$96,433,072. Personal property is not now assessed, but the comptroller, in his report of April 28, 1873, estimates the actual value of all property, including that of the federal government, at \$200,000,000. The receipts and expenditures

for the 31 months from June 1, 1871, the date of the organization of the territorial government, to Dec. 31, 1873, were as follows:

RECEIPTS.

Loans and bonds.....	\$6,427,550 00
Licenses, markets, and miscellaneous.....	1,083,949 06
Special and personal accounts.....	416 642 84
Trust funds.....	597 975 49
General taxes.....	1,006,206 21
School taxes.....	658,587 26
Police taxes.....	255,241 45
Gas taxes.....	244,500 95
Personal taxes.....	37,316 52

Total on account of District of Columbia...\$11,083,519 71

Total on account of the late corporations of Washington, Georgetown, and the levy court.....\$3,063,906 07

Total from all sources.....\$14,157,425 78

EXPENDITURES.

Account of loans and bonds.....	\$6,395,416 60
Salaries of general officers, and general contingencies.....	800,959 09
Special and personal accounts.....	407,359 79
Trust funds.....	576,835 73
Salaries of local officers, and local contingencies.	405,357 46
Salaries of officers, teachers, and contingent expenses of public schools	657,195 65
Salaries of officers and members, and contingent expenses of metropolitan police.....	244,558 99
Gas for street lamps.....	187,646 49
Miscellaneous.....	1,002,760 55

Total on account of District of Columbia...\$10,681,120 70

Total on account of the late corporations... 2,682,074 41

Total on all accounts.....\$13,363,195 11

Included in the expenditures on account of the late corporations is the sum of \$215,948 20 for the completion of public school buildings and the proportion due to colored schools, making the whole amount expended for school purposes \$873,143 85. The expenditures to Dec. 31, 1872, included \$4,833,009 30 on account of the board of public works, \$53,199 25 for the board of health, \$450,000 for an additional supply of Potomac water, \$186,330 57 for interest, and \$109,051 58 for the fire department. The tax levy for the year ending June 30, 1874, was \$2 in Washington city and Georgetown, and \$1 58 in the county of Washington, on each \$100 of taxable property, amounting to \$1,888,152 22 in all. The debt on Dec. 31, 1873, was \$9,878,039 91, of which \$5,527,850 belonged to the present District government, \$4,096,801 01 to the late corporation of Washington, \$251,689 to Georgetown, and \$1,699 90 to the levy court. The outstanding bonds issued by the present government amounted to \$8,213,850, viz.: permanent improvement bonds, \$4,790,000; funding bonds, \$2,686,000; water stock bonds, \$485,000; market stock bonds, \$140,900; Chicago relief bonds, &c., \$111,900. From 1797 to 1870 congress appropriated \$42,228,963 80 for various objects connected with the District of Columbia.—There are 22 important charitable and reformatory institutions. The following are those more or less directly connected with the territorial or national government, with the number of inmates, Dec. 1, 1872. The Wash-

ington city asylum is supported by the District government and by the products of the farm attached, which is worked by the prisoners. It receives sick and destitute persons, and vagrants and petty criminals committed by the courts; it has from 50 to 200 inmates. The reform school for boys had 79 inmates, consisting of juvenile delinquents committed by the courts, and of destitute boys admitted on the order of the governor of the District or the trustees of the schools. Congress has recently appropriated \$100,000 for the purchase of a farm and the erection of buildings for this institution, and in August, 1872, it was removed from the vicinity of Georgetown to Mount Lincoln, 3 m. N. E. of the capitol, where 150 acres of ground have been purchased, upon which a building capable of accommodating 300 inmates has been erected. The national soldiers' and sailors' orphans' asylum, established in 1866, had 37 male and 31 female inmates; it receives only the orphans of Union soldiers and sailors, and is supported by annual appropriations by congress, and by voluntary contributions. The freedman's hospital, established in 1865, is supported by congress, which in 1872 appropriated \$74,000 for its maintenance; its inmates, who are admitted on the recommendation of the governor of the District, numbered 115 males and 110 females, all but 10 colored. The national soldiers' home, about 2 m. N. of Washington, was established in 1851 with the unexpended balance of the contributions levied by Gen. Scott during the Mexican war. It is supported mainly by a levy of 12½ cents on the monthly pay of soldiers of the regular army. Its inmates, superannuated and disabled soldiers, numbered 250. Congress also makes an annual appropriation in aid of the Columbia hospital for women and lying-in asylum, and of Providence hospital (Roman Catholic). The government hospital for the insane, situated S. of the Anacostia river, near Uniontown, was established in 1853 for the "curative treatment of the insane of the army and navy and of the District of Columbia." It contained 422 male and 139 female patients. The Columbia institution for the deaf and dumb was founded by Amos Kendall, and chartered by congress in 1857. It is supported by congressional appropriations, by the tuition fees of a few paying pupils, and by voluntary contributions. The amount appropriated by congress in 1872 was \$48,000 for the support of the institution, and \$70,000 for the purchase of additional grounds. It is designed especially for residents of the District and the children of soldiers and sailors. A collegiate department, known as the national deaf-mute college (the only such college in the world), was organized in 1864, and is designed to receive students from the deaf and dumb institutions of the various states. In 1873 it had 8 professors and 59 students, of whom 19 were semi-mutes. Including the above, the whole number of in-

structors in the institution was 11, and the whole number of pupils 108, of whom 16 were females. Columbian college (Baptist) was organized in 1822, and in 1872 had 27 professors and instructors, and 261 students. Howard university (Congregational), organized in 1866, is an outgrowth of the freedmen's bureau, designed especially for colored students, but is not restricted by its charter in respect of race or sex. (See HOWARD UNIVERSITY.) Gonzaga college (Roman Catholic), organized in 1858, had in 1872 9 professors and 107 students in the preparatory department. Wayland seminary (colored Baptist), organized in 1865, had 8 instructors and 85 students. The law school of the national university, organized in 1870 as a branch of a projected university, had 6 professors and 98 students. The national college of pharmacy has been recently organized with 3 professors and 17 students. The institutions mentioned above are in Washington. In Georgetown is Georgetown college (Roman Catholic), organized in 1789, a notice of which will be found in the article GEORGETOWN. Besides Georgetown and Washington, there are four post offices in the District, viz : Anacostia, Brightwood, Mount Pleasant, and Tenallytown. The public schools are under the charge of four boards of trustees. One board, of 20 members, has control of the white schools of Washington city; the second, of five members, has control of the white schools of Georgetown; the third, of seven members, has charge of the schools both white and colored of the county of Washington. There is a superintendent for these schools, who, as well as the trustees, is appointed by the governor for two years. A board of three trustees, appointed by the secretary of the interior for three years, was constituted by act of congress in 1862. This board appointed a superintendent, and continued to have the management of the colored schools of Georgetown and Washington city until April 1, 1873, when the act of congress of March 3, 1873, went into effect, which created a board of nine trustees, appointed by the governor for three years (three of them retiring annually), for those schools, and provided for the appointment of a superintendent, a secretary, and a treasurer by the same authority. The public schools are entitled to "all moneys accruing from fines, penalties, and forfeitures for violation of the laws of the United States within the District of Columbia." The colored schools of Washington and Georgetown receive a proportion of all moneys devoted to school purposes in those cities, determined by the ratio which the colored children bear to the whole number of children of school age. The act of congress of June 25, 1864, requires parents and guardians, under penalty of a fine of \$20, to send their children between the ages of 6 and 14 years to some public school at least 12 weeks in each year, unless elsewhere educated. By the census of 1870 there were 31,671 children of school age (6 to

17 years inclusive), of whom 10,494 were colored, 14,971 were males, and 16,700 females. The following statements embody the statistics of the colored schools of Washington city and Georgetown for the year ending June 30, 1872, and of the other schools for the year ending Aug. 31, 1872: the number of school houses owned by the District was 42; value of school property, \$816,005; number of schools, 233, including 1 preparatory high school (colored), 16 grammar, 36 intermediate, 51 secondary, 111 primary, and 18 ungraded schools (county of Washington); number of teachers, 264, of whom 27 were males; pupils enrolled, 15,555, of whom 5,435 were colored; average attendance, 10,688, of whom 3,639 were colored. The school tax in Washington city was 60 cents on \$100, in Georgetown 25 cents, and in the county of Washington 40 cents. The receipts were \$3,398 64 from fines, &c., and \$352,241 43 from taxation; total, \$355,640 07. The total expenditures were \$479,995 94, including \$129,654 51 for teachers' wages, \$79,409 76 for incidental expenses, and \$140,577 51 for sites, buildings, &c. The separate expenditures (included in the total) of the colored schools of Washington and Georgetown were \$49,855 59 for teachers' wages, \$18,747 04 for incidental expenses, and \$60,403 68 for sites, buildings, &c.; total, \$129,006 31. The school tax for the year ending June 30, 1873, was 33 cents on \$100 in Washington city, 53 cents in Georgetown, and 50 cents in the county of Washington. According to the census of 1870, there were 87 schools not public, viz.: 1 classical academy, 2 commercial, 61 day and boarding, and 23 parochial and charity schools. The number of teachers was 256; pupils, 7,010; annual income, \$199,318. The number of private schools in 1872, as appears by the report of the United States commissioner of education, was 123 (including 31 institutions for secondary instruction), having 6,217 pupils. The census returns of 1870 include 696 libraries, containing 793,702 volumes, of which 569, with 883,766 volumes, were private. The others were classified as follows: 1 congressional, 190,000 volumes; 14 departmental (United States government), 115,185; 4 court and law, 32,848; 95 Sabbath school, 39,853; 6 church, 2,850; 7 circulating, 29,700; total libraries not private, 127, with 409,936 volumes. The number of newspapers and periodicals was 22, viz.: 3 daily, 1 tri-weekly, 12 weekly, and 6 monthly. There were 111 church organizations and 112 houses of worship; number of sittings, 63,655; value of property, \$3,393,100. The church edifices were: Baptist, 16; Christian, 1; Congregational, 1; Episcopal, 16; Evangelical Association, 1; Friends', 1; Jewish, 1; Lutheran, 10; Methodist, 36; New Jerusalem, 1; Presbyterian, 15; Reformed, 1; Roman Catholic, 11; Unitarian, 1.—After the adoption of the articles of confederation by the United States, the question of fixing upon a seat of government

for the Union called forth much sectional rivalry. During the period between the conclusion of the revolutionary war and the adoption of the present constitution, congress met at Princeton, Annapolis, Trenton, and New York. After the organization of the government under the constitution, March 4, 1789, warm discussions took place in congress on the location of the capital, which were finally settled by the passage, June 23, 1790, of an act containing the following clause: "That a district of territory on the river Potomac, at some place between the mouths of the Eastern branch and the Connogacheague, be and the same is hereby accepted for the permanent seat of the government of the United States." The same act provided that congress should hold its sessions at Philadelphia until the first Monday in November, 1800, when the government should remove to the district selected on the Potomac. The area fixed upon for the district was a square of 10 miles, or 100 square miles. It embraced 64 square miles of Maryland, constituting the county of Washington, which was ceded by that state to the United States in 1788, and 36 square miles of Virginia, constituting the county of Alexandria, ceded in 1789. The portion on the Virginia side of the Potomac was retroceded to that state in 1846. In 1814 Washington was taken by the British, who burned the capitol, presidential mansion, and congressional library. In the early part of the civil war strong fortifications were erected for the protection of the capital, which was several times threatened; but no fighting occurred within the District until July 12, 1864, when Gen. Early with a considerable force attacked Fort Stevens, an isolated work about 6 m. N. of Washington. At this time the garrison had been much weakened by the withdrawal of troops to strengthen the army before Richmond, but reinforcements arrived the same day, and the confederates were repulsed. Slavery was abolished by the act of congress of April 16, 1862, and the right of suffrage was extended to colored citizens by the act of Jan. 8, 1867. The constitution of the United States confers upon congress the exclusive legislative control over the District, but does not allow the inhabitants any vote for presidential electors. Previous to the act of 1871 the legislative power had been exercised directly by congress, in which, however, the people had no representation; but upon the establishment of a territorial form of government by that act the right of electing a delegate to congress, with the same privileges as delegates of other territories, was granted. The act repealed the charters of the cities of Washington (pop. in 1870, 109,199) and Georgetown (pop. 11,384), which had been incorporated May 3, 1802, and Dec. 25, 1789, respectively, on and after June 1, 1871; but provided that the portions of the District included within the then limits of those cities should continue to be known as the city of Washington and the

city of Georgetown respectively. At the same time the levy court of the District of Columbia ceased to exist, and the District of Columbia became the successor of the corporations of the cities and of the county of Washington. (See **GEORGETOWN**, and **WASHINGTON**.)

DITHYRAMBUS, in Grecian antiquity, a song sung in the vintage season in honor of Bacchus. The origin of these songs is traced to the earliest ages of Greek civilization, and the most famed of the early composers of them was Arion of Methymna. But few fragments of ancient dithyrambic poetry remain, and it is only by tradition that we know the successes of Melanippides, Pindar, and Philoxenus in this style of composition. The dithyrambus was primitively religious; it was lively, rapid, brilliant, and disordered, like the joy and intoxication of a Bacchanalian festival. In the heat of improvisation, the poets often united several words into one, from which resulted expressions so voluminous and sonorous that they wearied alike the ear and the imagination. In the age of Pericles this kind of poetry was the object of raillery.

DITMARSH (Germ. *Dithmarschen*, or *Ditmarsen*, i. e., the German marshes), the westernmost portion of Holstein, Prussia, comprising the coast land on the North sea, between the Eider and the Elbe; area, 500 sq. m.; pop. about 75,000. The surface is a low flat, protected against inundation by strong embankments. Excepting in the marshy districts, it has a rich alluvial soil, bearing heavy crops of wheat, beans, and hay. The inhabitants are a sturdy people of the primitive Teutonic type, and during the middle ages maintained a considerable degree of autonomy and equality, bravely defending their rights against the encroachments of their various rulers, German and Danish. After severe struggles Ditmarsh became part of Holstein, under Danish rule, in 1559, but continued to be governed by its own code. In 1866 it was with the rest of Holstein annexed to Prussia.

DITTON, Humphrey, an English mathematician, born in Salisbury, May 29, 1675, died Oct. 15, 1715. He studied theology, and was for some years a dissenting clergyman, but subsequently devoted himself to mathematics. He was encouraged by Sir Isaac Newton, through whose influence he was elected professor in the newly created mathematical school of Christ's hospital, a position which he retained till his death. In 1714 he published with Whiston an advertisement of a new method of finding the longitude at sea. The plan was approved by Newton, but rejected by the board of longitude; and it is said that the chagrin caused by this disappointment, and by some obscene verses of Swift, occasioned his death. He was the author of numerous mathematical treatises, among which are the following: "Of the Tangents of Curves;" "General Laws of Nature and of Motion;" "An Institution of Fluxions;" and "The New Law of

Fluids, or a Discourse concerning the Ascent of Liquids in exact Geometrical Figures, between two nearly contiguous Surfaces."

DIU, a Portuguese island and town of India, separated by a narrow channel from the S. extremity of Guzerat, in lat. 20° 43' N., lon. 70° 45' E., 160 m. N. W. of Bombay; area, 12 sq. m.; pop. about 10,000. The soil is unfit for cultivation and the water is brackish, but provisions are plentifully supplied from the mainland, with which the inhabitants carry on a lively trade. The town is situated on the E. end of the island, is well fortified, and has an excellent harbor. It was renowned in ancient times for a magnificent temple of Mahadeva, which was destroyed by Shah Mahmoud of Ghuzni about 1025. The island was taken in 1515 by the Portuguese, and was pillaged in 1670 by the Arabs of Muscat. It is at present one of the most flourishing of the Portuguese settlements.

DIURETICS, drugs used to increase the amount of the urinary excretion or of some of its constituents. They may be divided into several groups: 1, those which increase the water of the urine with but little effect on its solid constituents; 2, those which increase both the water and the solids; 3, those which increase the solid rather than the watery constituents; 4, those which alter the quality without augmenting the quantity. To the first class belong squills, juniper, taraxicum, horse-radish, parsley, broom, carrot seed, spirits of nitrous ether, pure water, cantharides, and turpentine. Cantharides and turpentine may be given in such doses as to produce congestion of the kidneys and bloody urine. If their action is carried far enough, a suppression instead of an increase of the urine may result. Many salines, such as acetates, citrates, tartrates, and carbonates of soda and potassa, nitrate of potassa, and sulphate and citrate of magnesia, belong to the second class. Some of these salts may be given so as to pass off by the bowels, and exert but little effect upon the kidneys. In general, it is necessary to give this class of drugs in small doses, frequently repeated, when it is desired that they should pass through the kidneys and act as diuretics, and in one or two large doses when they are intended to act upon the bowels. Colchicum is the principal agent of the third class. According to Dr. Hammond's experiments, it has a powerful effect in augmenting the amount of solid urinary constituents, while the water is comparatively little affected. The salts formed by the alkalies with carbonic and vegetable acids render the urine alkaline when given in sufficient doses, and are consequently examples of the fourth group of diuretics. *Uva ursi* and *chimaphila umbellata* or winter-green act as diuretics in virtue of the volatile oils and tannic acid which they contain, and which pass into the urine, imparting to it a dark color and peculiar odor. Buchu, copaiba, cubeb, and similar substances act by virtue of

their resins and volatile oil. Their therapeutic effect is due rather to the alterative action of the urine bearing these constituents on the mucous membranes by which it is excreted and over which it passes, than to any increase in its amount. Benzoic acid passes into the urine in the form of hippuric acid, and may be used when it is desirable to increase the acidity of that fluid. Digitalis, although frequently used as a diuretic, is probably only secondarily so. It increases the flow of urine by virtue of its action upon the arterial tension of the kidneys, promoting thereby a more rapid flow and even distribution of the blood through them. Digitalis is frequently combined with squill.—Diuretics are used in various stages of kidney diseases (where they should be very cautiously managed), in gout, rheumatism, dropsy, and affections of the urinary passages. Although very useful and efficient in many cases, they cannot always be relied upon, and consequently are not regarded as among the most certain of medicines. It is well known that many wines, especially hocks and acid wines, are apt to run off by the kidneys. Ardent spirits, especially gin and whiskey, will also increase the urine, but neither wines nor ardent spirits are often prescribed as diuretics.

DIVER (*colymbus*, Linn.), a bird of the order *natatores* and family *colymbidae*, the latter containing the divers and the grebes. The bill in this genus is long, strong, straight, curved slightly at the tip, which is sharp, with compressed sides; the nostrils are in a membranous groove; the wings are moderate and pointed, the first and second quills the longest; the tail is very short and rounded; the tarsi rather short, compressed, and covered with reticulated scales; the toes long, the three anterior united by an entire web, and the inner side of the internal toe margined with membrane; the hind toe short, with a small membranous margin; the claws moderate, depressed, and broad. Only three species are well ascertained, the *C. glacialis*, *C. arcticus*, and *C. septentrionalis* (Linn.), which belong to the arctic circle, migrating to the northern temperate regions of America and Europe. The great northern diver, generally called loon in the United States (*C. glacialis*), is a large, powerful, and handsome bird; the largest males measure about 3 ft. to the end of the tail, with an extent of wings of nearly 5 ft., and a weight of from 8 to 10 lbs. The head is moderate, narrowed in front; the neck thick and long; the body elongated and depressed; the feet very far back; the plumage short and dense. The bill is black, iris deep bright red, feet grayish blue, with the webs brownish black; the head and neck are dark greenish blue, with purple reflections; on the throat there is a transverse white patch, with longitudinal dusky streaks; in the middle of the neck are two white patches, continuous behind, but separated an inch in front; the sides of the neck at the lower part are streaked longi-

tudinally black and white, there being on each feather two oblong spots of the latter hue; the upper parts are glossy black, with spots of white in regular transverse curved lines with

1. The Great Northern Diver (*Colymbus glacialis*). 2. The Red-throated Diver (*C. septentrionalis*).

the convexity backward, the spots being round- and small toward the neck, sides, and tail coverts, larger and quadrangular on the middle of the back, largest on the scapulars; the lower parts are white, except on the sides under the wings, which are black with elliptical white spots, a faint dusky band across the vent, and the lower tail coverts, which are blackish, tipped with white; the tail is brownish black, with a paler tip. The female resembles the male in colors, but is smaller. The young in winter are dark grayish brown above, white underneath, with the sides dusky; toward spring the white spots begin to appear, and the plumage is that of the adult at the end of summer; they go further south than the adults. The flight is rapid, long sustained, and at a considerable elevation. The gait of the bird on land is generally slow and awkward; on the water, when at ease, it swims lightly, but when alarmed it sinks the body so deeply that not more than inch of its back can be seen. As a diver it is unsurpassed except by the darter and the auk, disappearing quickly, flying rapidly beneath the surface, remaining under water a long time, and coming up again at a great distance from the spot of its disappearance. Loons are occasionally found drowned in fishermen's nets, and are sometimes caught on hooks. The curiosity of the loon is often taken advantage of to draw them within shot, as the bird will almost always approach any bright-colored object waved by a concealed gunner; hence the phrase "stupid as a loon." Its notes are so loud and plaintive that to be "as noisy as a loon" has become a proverb. Its food consists of fish, lizards, frogs, aquatic insects, and the roots of fresh-water plants; it fishes in both salt and fresh water, and usually swallows its food beneath the surface. The flesh is tough and rank. The loon breeds

in various parts of the United States from Maine to Maryland, according to Audubon; and Dr. Richardson says it is found breeding as far N. as 70°. The nest is built near the water, in marshes, on the ground, and of rushes and grasses growing in the vicinity. The eggs are generally three, about $3\frac{1}{2}$ in. long by $2\frac{1}{4}$ broad, elongated, with a narrow point; their color is dull greenish ochry, with indistinct spots of dark umber, most numerous toward the larger end. The loon is found also in Europe and northern Asia.—The black-throated diver (*C. arcticus*), next in size to the loon, is 29 in. long to the end of tail, with an extent of wings of about 40 in. The upper parts are glossy black, with a greenish tinge anteriorly and brownish behind, the head and hind neck being hoary; on the fore part of the back are two longitudinal bands of white bars, the feathers tipped with white; the scapulars and wing coverts with white spots; the quills are blackish brown, with a gray tinge externally; on the front of the neck for about six inches is a purplish black patch, ending angularly below, with a band of white spots above; the sides of the neck are blackish brown, with longitudinal white streaks; the lower parts are pure white, except a dusky band under the wings. The female is smaller than the male, but similarly colored. This species breeds in the far north, where the old birds principally remain, and whence the young wander over North America and northern and eastern Europe. Birds in full plumage are rarely obtained in the United States, and, according to Audubon, never further south than Delaware; along the eastern shores they are seen from autumn until spring. Their flight is rapid and well sustained, and performed with the neck and feet stretched out at full length.—The red-throated diver (*C. septentrionalis*) is about 26 in. long, with an extent of wing of 43 in., and a weight of 4 lbs. It resembles the preceding species except in the rich brownish red color of the anterior neck, and the lines of black and white on the hind head and neck; in the young males the fore neck is merely dotted with red. They begin to fly north to breed from early spring to the middle of May; they are found on the coast from Maryland to Maine, from autumn to spring; the younger the birds, the further south they go, and it is rare to find an old one south of Boston; they abound in the bay of Fundy. They are very shy, and always approach their nests from the water. Both sexes incubate. The full beauty of the plumage is not attained until the fourth year. They are rarely seen inland, and hardly ever out of the breeding season. Along the New England coast and in the bay of Fundy they are commonly called “cape racer” and “scapegrace.”

DIVI, or **Divi-Divi**, the pod of a leguminous shrub, *Casalpinia coriaria*, a native of the northern parts of South America and the West India islands, used for tanning, for which purpose it is exported to Europe and other coun-

tries. The plant grows to the height of 20 or 30 ft., and the pods, which are dark brown, and curl up in drying, attain a length of 3 in. The rind has a strongly astringent and bitter taste from the tannin contained between the outer layer and the husk that encloses the seed. The leather prepared with it is very porous and acquires a deep brownish red color. Almost the only ports of shipment are Maracaibo, Rio Hacha, and Savanilla.

DIVIDING ENGINE. See GRADUATION.

DIVINATION (Lat. *divinatio*, from *divinus*, divinely or prophetically inspired), a general term for the various pretended arts of discovering secret or future things by preternatural means. These arts appear in the remotest antiquity, intimately connected with religion, furnished with rules, founded on mysterious principles, and fortified by the pretences of a science. Both as a learned doctrine and a popular faith, divination has always existed in the East, and was common in Europe throughout classical antiquity and during the middle ages. It was distinguished by the Greeks as natural or artificial; the former being a presage of future events by a sort of inspiration which was possible only to persons specially favored by the deity; the latter being founded on careful observation of certain natural phenomena which were believed to have mysterious relations with future events. Astrologers, augurs, sorcerers, fortune tellers, and second-sighted persons are eminent examples of diviners. The following are among the principal of the numerous forms of artificial divination practised in antiquity: Alectryomancy was practised by drawing a circle and dividing it into 24 equal parts, into each of which were put a letter of the alphabet and a grain of wheat; a cock was then placed in the centre, and the letters, being put together in the order that the grains were eaten by it, made a word which solved the question of the diviner. Arithmomaney depended upon the secret operation of numbers and magical squares, and the numerical value of letters; it was practised by the Chaldeans, and formed a part of the doctrine of the Pythagoreans, Neo-Platonists, and cabalists. Axinomancy consisted in suspending an axe from an upright stick, and the names of suspected persons being pronounced it was supposed to indicate the guilty by its motion. Belomancy consisted in the choice of arrows by chance from a bag containing many of them inscribed with various responses; it was in use especially among the Arabians. Capnomancy consisted either in observing the direction taken by smoke, or in inhaling the smoke of victims, which was believed to produce prophetic inspiration. Dactylomancy was practised by enchanted rings, or rings that were made in harmony with the position of the celestial bodies. Its origin is attributed to Helen, the wife of Menelaus. It is by one of these rings that Gyges is said to have rendered himself invisible. A

favorite method was to suspend the ring by a hair within a goblet, when it began to swing, the motion gradually increasing till it struck the vessel once or twice for yes or no, as previously determined. Gyromancy consisted in walking round in a circle, the circumference of which was marked with letters, the presage being drawn from the letters on which the inquirers stumbled when they became too dizzy to stand. Hydromancy, or divination by water, consisted in observing the colors and images presented by water in a vase, either when motionless or when disturbed by dropping little stones into it. The motions of the agitated waves of the sea were also studied for purposes of divination, especially by the ancient Sicilians and Eubœans. Lampadomancy furnished presages for the future from the form, color, and fluctuations of the flame of a lamp. Lithomancy was a method of divination by means of precious stones. The sounds of stones striking each other gave presages, and the amethyst was believed to have the virtue of sending prophetic dreams to whoever possessed it. The *betylia*, or animated stones, of which the Greeks learned from the Persians, and which were believed to bear oracles, are celebrated instances. Ornithomancy, or divination from the flight and song of birds, was a principal function of the Roman augurs. (See AUGUR.) The flame of fire (pyromancy), the accidental opening of a book (rhapsodomancy), the combination of cards (chartomancy), the drawing of lots, the dropping of staffs or observation of cups (especially in use among the old Egyptians), the interpretation of dreams, the reflections of mirrors, and the contortions of serpents, are other means. Several of these methods of divination are yet in use among the superstitious.—Some of the more remarkable forms of divination are treated in special articles, as ASTROLOGY, CHIROMANCY, DIVINING ROD, and MAGIC.

DIVING. Though the natural constitution of man entirely unfits him for remaining under water with safety for more than a few moments, the desire of obtaining valuable articles lying at the bottom of the sea, as well as the necessity for the execution of certain manual operations in civil engineering, has led him to devise numerous expedients by which he is enabled to lengthen his continuance at moderate depths. It has been said that the pearl divers of Ceylon can remain under water six minutes, but this is hardly credible; and Admiral Hood, who took pains to time their diving, found that they were under water in no instance more than a minute. The instance narrated by Dr. Halley of a Florida Indian diver at Bermuda, who could remain two minutes under water, is regarded as an extreme case. In Franchère's "Narrative of a Voyage to the N. W. Coast of America," mention is made of the feats of diving of the Hawaiian islanders. Two of them were induced to go down in 14 fathoms of water in search of two sheaves

lost overboard. They went down several times, each time bringing up shells as a proof that they had been to the bottom. "We had the curiosity to hold our watches while they dove, and were astonished to find that they remained four minutes under the water. That exertion appeared to me, however, to fatigue them a great deal, to such a degree that the blood streamed from their nostrils and ears. At last one of them brought up the sheaves, and received the promised recompense, which consisted of four yards of cotton." Statements are made by others which render it probable that the time may be somewhat extended beyond that observed by Admiral Hood, or even by Dr. Halley. The lungs retain at each ordinary expiration considerable carbonic acid. By breathing deeply for a short time the quantity is lessened, and the blood becomes more than usually aerated and capable of performing its functions for a longer time than usual without renovation. It is told of Brunel that, wishing to examine a break in the Thames tunnel, he was lowered with another person in a diving bell to the depth of 30 ft., and the brake not permitting the bell to descend further, he dived into the water, holding a rope in his hand. He found no great difficulty in continuing under water fully two minutes, which is explained by the circumstance that the air in his lungs had been condensed in the bell to but little more than half its ordinary bulk, and therefore was capable of supplying much more oxygen. The pressure exerted by the water is not only felt in the lungs but upon all parts of the body to a sensible degree. At a depth of 17 ft. it amounts to about $7\frac{1}{2}$ lbs. to every square inch of surface, and increases about 0.44 of a pound

FIG. 1.—The Diver.

with every additional foot of depth.—To enable the diver to stay a considerable time under water, a dress called a diving armor is now generally employed for the laying of foundations and attaching apparatus for raising sunken vessels, and also by pearl and coral divers. Such a one is now (1874) in use in the construction of the foundations of the piers at the Battery in New York harbor. The diving dress or armor consists of a copper helmet, shown in fig. 1, tinned inside, and supplied with thick glass windows, and a copper breastplate which has a collar, to which the helmet is readily adjusted. The helmet is large enough for considerable rotation and lateral motion of the head, and allows

the air which is forced into it to be so diffused as to be breathed without inconvenience. The breastplate permits a free expansion of the lungs and sufficient motion to avoid constraint of the muscles. To the lower part of it is attached an India-rubber dress, having a body, legs, and arms; shoes are fitted on, and the whole is impervious to water. The central window of the helmet can be readily removed without removing the helmet. Lead weights are attached to the waist and soles of the shoes to enable the diver easily to maintain an erect position when standing or walking upon the bottom. A pump, shown in fig. 2, which is usually supplied with three cylinders, forces air through a flexible but strong India-rubber tube into an opening in the back of the helmet, which leads through a flat channel to the frontal portion, where it is delivered against the

glass windows, thus serving not only to supply the lungs of the diver, but to clear the moisture from the inner surface of the windows. The air finds its exit also at the back of the helmet. The air from the pump is free to pass down the waist and into the legs, between the person and the dress, and is delivered with sufficient force to overcome slightly the hydrostatic pressure. Fig. 2 represents the diver in the act of spreading a large bucket of hydraulic concrete upon the bed of a harbor, preparatory to laying blocks for the foundations of a pier. A signal rope communicates with an attendant on a boat which contains the air pump. The signals of the diver are communicated verbally by the attendant to a director stationed upon the derrick by which the buckets of concrete or blocks of béton are moved into position, and by him bells are rung which enable the atten-

FIG. 2.—The Diver spreading Concrete.

dant at the engine to execute the necessary movements. In 1856 Mr. E. P. Harrington of Westfield, N. Y., recovered the iron safe of the steamer Atlantic, sunk four years previously in Lake Erie in about 170 ft. of water. The safe itself was at the depth of 157 ft. He used a common flexible India-rubber armor, unprotected with metal, and supplied with air sent down from a pump through a tube of $\frac{3}{4}$ -inch bore, composed of nine alternate layers of canvas and rubber, with a copper wire coiled inside to prevent collapse. He also wore shoes of lead, and carried weights of lead amounting in all to 248 lbs. His first descent was on June 19, and the 18th and last was on the 22d, when he succeeded in attaching a line to the safe, which was in a state room on the upper deck, and it was hauled up. The time of his remaining below increased from one minute at the first descent to 11 minutes at the last. At the

depth of 50 to 70 ft. all light disappeared. He suffered from extreme chilliness; his strength too, he thought, was diminished nine tenths. The pressure sometimes caused a violent rush of blood to the head, and the appearance of bright flashes like electrical sparks.

DIVING BELL, a hollow inverted vessel, in which persons may descend to considerable depths, fresh air being forced down from above to supply the amount required for breathing, and under which upon the bottom they may work to prepare foundations, or to secure articles of value. The principle of the diving bell is seen in pressing any vessel like a tumbler mouth downward into water. The air within the vessel prevents the water from rising and filling it, but it is made to occupy less space as the pressure is increased with the increasing depth of the water. If the vessel were forced down to the depth of 33 ft., the

water would half fill it. Such is the simplest form of the diving bell, as it was known probably in the time of Aristotle, mention being made that divers at that period took down with them a kind of kettle to enable them to remain longer under water. During the reign of Charles V. a satisfactory experiment was tried by two Greeks at Toledo, in Spain, in the presence of the monarch and his court, of descending in a large inverted kettle into the water with a burning light, and coming up dry. But in this experiment, made by order of Charles to prove the possibility of the thing, and in others also undertaken for practical purposes (as recovering sunken treasure) in the course of the succeeding 200 years, there was no provision for renewing the supply of air as it became exhausted, nor for keeping the vessel free from the water forced by the pressure to rise within it. About the year 1715 Dr. Halley contrived a method of furnishing air to the bell while it was at the bottom. He had two tight barrels prepared, each with an open bung below, and a hose attached to the top long enough to reach outside below the bottom, in which position the air could not escape through it. These, loaded with weights, were sunk alternately, like two buckets in a well, or, by guys attached to the bell, were made to drop alongside of it. A person within, reaching out into the water under the mouth of the bell, could draw in the hose and raise the end of it above the level of the top of the cask, when the air would be forced upward and furnish a new supply to the bell. All the water would thus be displaced, and one could step about upon the bottom over the area covered by the bell. The air contaminated by breathing was let off by a stopcock in the roof, and pieces of glass set in here admitted the light. In the apparatus thus prepared Dr. Halley descended with four others, and remained an hour and a half in water more than nine fathoms deep. He soon afterward devised an apparatus with which one could leave the bell and walk on the bottom for a considerable distance. The diver was furnished with a heavy metallic cap, which was connected with a long flexible tube for conveying air within the bell. Heavy weights were attached to his belt and also to the feet to counteract the buoyancy of the body at great depths. Numerous modifications in the construction of the bell continued to be made by others, none of which proved to be of much importance until the engineer Smeaton applied the air pump about the year 1779 to forcing down the air, and made the first application of the apparatus to engineering purposes. In 1788 he constructed a bell of cast iron, in the form of a chest, $4\frac{1}{2}$ ft. long, $4\frac{1}{2}$ ft. high, 3 ft. wide, and weighing $2\frac{1}{2}$ tons, so as to sink by its own gravity.—The most practical form of diving bell is called the nautilus, which is a sort of submarine boat whose lateral as well as vertical movements are controlled by the occupants. It is con-

structed with double sides, sufficiently far apart to form either air or water chambers, as it may be required to ascend or descend. In descending, they are supplied with water enough to cause the machine to sink. In ascending, the water is forced out by an air pump, worked on shore according to signals. It may be given considerable buoyancy, depending upon its size, and heavy weights may be raised with it. A plate is adjusted to the bottom, which may be removed at pleasure, air being pumped in to balance the hydrostatic pressure. Cables, worked by windlasses inside, pass out through holes surrounded by water-tight stuffing boxes, and are made fast at convenient distances. These enable the occupants to move the nautilus in any desired lateral direction. A man-hole at the top, conveniently closed by a cap, permits entrance or exit of the operators. The tube which connects with the air pump above water is used for forcing air either into the

The Nautilus.

water chambers or into the central chamber. Pipes with stopcocks readily enable the change to be effected.—The increase of pressure experienced in descending in a bell affects individuals differently. Usually a pain is felt upon the tympanum of the ear, caused by the pressure upon the outside not being at once counterbalanced by the air within the tympanic cavity having acquired the same density. The construction of the Eustachian tube, leading from the mouth to the internal part of the ear, is such that a little time is necessary for the compressed air to make its way within. This usually takes place by a sudden impulse, which may be hastened by an effort of the individual like that of swallowing, the mouth and nostrils being closed at the time.

DIVINING ROD, an implement used by pretenders who undertake to discover water or minerals hidden in the ground. Its use has been traced as far back as the 11th century; and there are still many who believe in its efficacy. As commonly used, the divining rod

is a forked slender stick of witch hazel; elastic twigs, however, of any sort, or even two sticks of whalebone fastened together at one end, are sometimes employed. One branch of the twig is taken in each hand between the thumb and fore finger, the two ends pointing down. Holding the stick in this position, the palms toward the face, the operator passes over the surface of the ground; and wherever the upper point of the stick bends over and points downward, there he affirms the spring or metallic vein will be found. Some even pretend to designate the distance below the surface according to the force of the movement, or according to the diameter of the circle over which the action is perceived, one rule being that the depth is half the diameter of this circle; whence the deeper the object is below the surface the further is its influence exerted. The experiment being tested by digging, if water is found it proves the genuineness of the operation; if it is not found, something else is, to which the effect is attributed; or it is declared that the water which attracted the rod is sure to be met with if the digging is continued deep enough.

DIVISIBILITY, one of the general properties of matter, usually classed with impenetrability, extension, &c. The proposition that there is no limit to the mathematical subdivision of matter is universally admitted; but the question in its relation to physical science is a different one, and its treatment depends upon the adoption of one of two theories. Formerly it was not infrequently supposed that matter is continuous; at least, the idea that it consisted of ultimate atoms of a definite magnitude, and therefore that each body was composed of a certain limited number of them, was not entertained. According to the old doctrine of the homogeneity of matter, therefore, its divisibility physically could only be limited by the means employed, and in a theoretical point of view was logically considered as infinite. But the doctrine of Dalton in regard to definite and multiple proportions has been so well established by the investigations of chemistry, and researches into the molecular constitution of matter, particularly gaseous bodies, that physicists now generally hold that the subdivision of matter is limited physically, that at last the atoms become separated from one another, and these being the primordial particles, no conception can be formed of any subdivision of them. As examples of the great extent to which subdivision may be carried without arriving at the ultimate atoms, or even at the molecules of which they are composed, may be taken the spinning of the spider's web, which contains 4,000,000 fibres, which of course are composed of organic molecules of a compound structure, spun together within the diameter of a human hair; the odor of musk, which may pervade a room for years by the exposure of only a single grain; and the extent to which sulphuret of lead may be diffused by adding together solutions of almost infinitesimal quan-

ties of a salt of lead and sulphuretted hydrogen. Dr. Thomson in this way obtained sulphuret of lead in quantities sensibly appreciable, but which must, according to his computations, have been divided into at least 500,000,000,000 parts; and yet it is uncertain whether this division extended to the binary molecules of the substance. The most striking examples, however, of the extent to which matter may be divided, and at the same time manifest its presence by the exhibition of a degree of energy, are furnished by the experiments of Tyndall with minute quantities of gases, vapors, and perfumes, in which he exhibits their influence upon the diathermancy of atmospheric air and the elementary gases. He found that a quantity of watery vapor so small as to be inappreciable by any other test would increase the absorptive power of dry air to the obscure rays of heat to such an extent as to cause a marked difference in the deflection of the needle of a galvanometer. The equality which he has also established as existing between the diathermancy of the elementary gases and their mechanical mixtures, indicating that their elementary particles assume uniform and therefore definite wave vibrations, when in a free state they are subjected to the action of uniform heat waves, has thrown so much light upon the subject of molecular physics that the conclusion that elementary atoms or primordial particles limit the divisibility of matter cannot be resisted.

DIVORCE, a dissolution of the bond of matrimony for cause occurring after marriage. In popular language, however, and often in judicial discussions and statutes, another class of cases is included, namely, those in which a marriage is annulled for antecedent causes rendering it void or voidable. The common law allowed divorces *causa impotentis seu frigiditatis*, if such impotence or frigidity existed before marriage, this being deemed a fraud; but it was no ground of divorce if it supervened after marriage; and it is the only kind of fraud of which we find mention in the English cases as a ground of annulling a marriage. Fraudulent representations by either party in respect to his or her condition in life, pecuniary circumstances, family connections, bodily health, and the like, however material these may have been in inducing a consent to the contract, still are unavailable as an impeachment of the marriage. A false personation of another, or any fraud by which one of the parties is deceived in respect to the person with whom the marriage is solemnized, is a sufficient cause for annulling the marriage; but this is put upon the ground of want of consent, it being equally essential to this as to other contracts that there should be the *animus contrahendi*, and the contract cannot take effect contrary to the real intention of the party who is to be bound. In the English courts the proceeding *causa jactitationis matrimonii* was intended for relief in such cases; in form, being an action by the

one party for an alleged assertion by the other that a marriage has taken place, whereupon the matter is tried, and unless the defendant proves that there was a marriage he is prohibited from averring the same, which is equivalent to a decree that there was no such marriage. A marriage accomplished by force may be annulled at the option of the party wronged, and so might a marriage one party to which was under the age of consent, or where the parties are within the prohibited degrees of consanguinity or affinity, or where one already has a wife or husband living from whom he or she is not divorced. In these cases judicial proceedings are not necessary, but they are permitted on grounds of prudence and propriety, and in order that any question which might be the subject of dispute may be conclusively determined. The nature of the fraud that shall invalidate a marriage it is not easy to define; but it may safely be assumed that it must be something entering into the very essentials of the relation, such as deception in respect to the person with whom the ceremony is performed. It has been held in some cases that if the woman, without the man's knowledge, is pregnant at the time of the ceremony, this is such a fraud as justifies a decree of nullity; but ante-nuptial unchastity is not sufficient, nor fraudulent representations in respect to other matters which may have constituted the inducement to the consent. Voluntary cohabitation as husband and wife is a bar to dissolution of the marriage, either for force or fraud, and it validates a marriage entered into before the age of consent, if continued after both parties have reached that age. In the English ecclesiastical courts there was formerly another ground upon which marriage could be annulled, viz., a prior engagement with another party. But this was abrogated by statute 26 George II., c. 33, which prohibited all suits to enforce performance of a marriage contract, the parties being thus left to an action for damages upon refusal to perform it.—We have next to consider divorce for causes occurring after marriage. Under the Hebrew law, it seems that the husband might put away his wife at will, giving her a bill of divorcement, and the divorced wife was then at liberty to marry again. An exception to the liberty of divorce was made of husbands who had deflowered their wives while unbetrothed virgins, and husbands who slandered the ante-nuptial chastity of their wives. Among the Greeks at an early day wives appear to have been bought and sold, and in later times divorce was substantially at the pleasure of either party, though a judicial form was gone through with. In Rome, for a long time, divorces appear to have been opposed to public sentiment, and to have required the sanction of a council or court of the relatives of the parties. Later, when dissoluteness of life had become general, divorce was common, and was permitted to both parties, and resorted to for

any cause or upon any caprice. Julius Cæsar and Pompey each divorced two wives, and Cicero put away his first wife that he might marry another who was rich, a union which was more speedily dissolved. These were representative cases, and by no means exceptional. Things were no better under the emperors, though efforts were made to impose some restraints, which, however, referred mainly to forms. Long after the empire became nominally Christian, divorce was unrestricted if by mutual consent, and might be obtained without mutual consent, though if the cause assigned was deemed insufficient to justify it, the party obtaining it was visited with a pecuniary penalty in the adjustment of their property rights. By the law of Theodosius II., adopted substantially by Justinian, the justifiable causes of divorce to the wife were certain high crimes, including murder, treason, poisoning, assaults or attempts upon the life of the wife, intimacy with prostitutes, and adultery. The justifiable causes on the part of the husband were substantially the same, with the addition of passing the night out of his house, and visiting places of amusement without his consent.—The theory of the sacramental nature of marriage gradually took possession of the Christian world; and when the reformation of the 16th century began, it was the accepted doctrine of the church that no offence of either party justified a dissolution of the marriage covenant, leaving the parties, or either of them, at liberty to marry again. This doctrine was supposed to be derived from the New Testament, and was confirmed by the council of Trent; but the reformers, who also planted themselves in this regard upon the gospel, though differing among themselves, generally agreed in permitting divorce for adultery and malicious desertion. Both Luther and Calvin thought that, though adultery ought to be punished with death, yet as the civil laws did not so provide, it was not wise to prohibit the divorced adulterer from marrying again. It may be said generally that from the beginning of the reformation to the present time the liberty of divorce in Protestant countries has been steadily enlarged. In Prussia it is permitted for adultery, sodomy and other unnatural vices, malicious desertion, persistent refusal of marital intercourse, plots or practices endangering life or health, ungovernable temper, drunkenness, extravagance, &c., unless corrected after admonition of the judge; failure of the husband to support the wife, hopeless insanity continuing for more than a year, and, where there are no children, deliberate mutual consent. This is the extreme of liberality, and goes somewhat further than is permitted in any of the other German states. Holland and Scotland allow divorce for adultery and desertion. The civil code of France allowed divorce—1, for adultery of the wife, but not for adultery of the husband except when he brought a paramour or concubine into his own house; 2, to either party for

any outrage, cruelty, or grievous wrong inflicted upon him or her by the other party; 3, to either upon the condemnation of the other to an infamous punishment, which is elsewhere defined to be either imprisonment, banishment, loss of civil rights, or being placed in the public stocks; 4, by mutual consent, with other satisfactory proof that the continuance of the marriage would be insupportable. These provisions were rescinded in the religious reaction of 1816. A law was passed (May, 1816) effacing divorce from the civil code, and reestablishing the old law, which allowed only separation. Ineffectual attempts were made in 1831 and 1832 to repeal this law, and there is therefore at present no divorce *a vinculo matrimonii* in France.—In England, from a very early period, divorce *a vinculo matrimonii* was not allowed for causes subsequent, but only a separation *a mensa et thoro*, which did not authorize either party to marry again. This practice was derived from the canon law, which held marriage to be a sacrament, and that it could not be dissolved for any cause whatever. But by statute 20 and 21 Victoria, c. 85 (1857), divorce *a vinculo* is now allowed on the petition of the husband for the adultery of the wife, and on the petition of the wife when the husband has been guilty of incestuous adultery, rape, bestiality, or adultery accompanied by cruelty. Divorce *a mensa et thoro* is by the same act denominated a decree of judicial separation, and under that designation is allowed for the same causes as heretofore. A new tribunal, called the court for divorce and matrimonial causes, has been established, and the jurisdiction of the ecclesiastical courts has been entirely superseded in such matters, except the granting of marriage licenses. Before this statute, however, private acts of divorce were sometimes obtained from parliament for the wife's adultery.—In America, it was assumed in the colonial period that the granting of divorce was or might be legislative in its nature, and after the revolution the state legislatures assumed the right to pass special acts for the purpose. This, however, led to very serious abuses, and is now generally prohibited by the state constitutions, and jurisdiction for the purpose conferred upon the courts, with the causes specifically enumerated. The subject is so important that we have deemed it proper to give the causes recognized by the statutes of the several states as sufficient to warrant a divorce *a vinculo*, omitting in the specification, for the sake of brevity, those which under any system would render the marriage void or voidable, viz.: a previous marriage still in force, and a marriage under the age of consent, or within the prohibited degrees of relationship. Alabama: physical incapacity, adultery, desertion for two years, two years' imprisonment on a sentence of seven years or more, sodomy, pregnancy at marriage without the husband's knowledge, violence of the husband to the wife endangering her life, or reasonable fear there-

of. Arkansas: impotence, desertion for a year, conviction of felony or other infamous crime, habitual drunkenness for a year, such cruel and barbarous treatment as endangers life, or such indignities to the person as render the condition intolerable, adultery. California: adultery, extreme cruelty, consent obtained by force or fraud, wilful desertion, wilful neglect of the husband to provide for the wife for two years, habitual intemperance, conviction of felony, marriage of the female under 14 without consent of parents or guardian. Connecticut: adultery, fraudulent contract, impotence, wilful desertion for three years with total neglect of duty, seven years' absence not heard from, habitual intemperance, intolerable cruelty, sentence to imprisonment for life, bestiality, or any other infamous crime involving a violation of conjugal duty, and punishable by imprisonment in state prison, or any such misconduct as permanently destroys happiness and defeats the purposes of marriage. Delaware: adultery of the wife or impotence of either party, adultery of the husband being only cause for divorce from bed and board, with cruelty and desertion. Florida: impotence, adultery, extreme cruelty, habitual indulgence in violent and ungovernable temper, habitual intemperance, desertion for a year. Georgia: mental incapacity, impotence, force, duress, or fraud in obtaining the marriage, pregnancy at the time of marriage without the husband's knowledge, adultery, desertion for three years, sentence to the penitentiary for two years or more for an offence involving moral turpitude, habitual intoxication, cruelty. Illinois: impotence, adultery, desertion for two years, extreme and repeated cruelty, habitual drunkenness for two years, conviction of felony, or other infamous crime; and in addition to these causes the court may decree a divorce on other grounds if satisfied of the expediency of so doing. Indiana: adultery, impotence, abandonment for a year, cruel and inhuman treatment, habitual drunkenness, failure of the husband to provide, conviction of an infamous crime after marriage, and for such other causes as the court in its discretion may deem sufficient. Iowa: impotence, adultery, wilful desertion for two years, conviction of felony, habitual drunkenness, treatment that endangers life. Kansas: desertion for a year, adultery, impotence, pregnancy at the time of marriage by another than the husband, extreme cruelty, fraudulent contract, habitual drunkenness, gross neglect of duty, conviction of felony. Kentucky: impotence, living apart without cohabitation for five years, abandonment and living in adultery for six months, desertion for a year, conviction of felony, force, duress, or fraud in obtaining marriage, contracting a loathsome disease, uniting with any religious society which requires renunciation of the marriage contract or forbids cohabitation, confirmed drunkenness of the husband with improvidence continued for a year, habitual mis-

behavior of the husband continued in a cruel and inhuman manner not less than six months, cruel beating or injury of the wife or attempts at the same, pregnancy at the time of marriage without the husband's knowledge, adultery of the wife or such lewd and lascivious behavior on her part as proves her to be unchaste, confirmed mental unsoundness of not less than three years' continuance resulting from intemperance or hereditary taint and concealed at the time of marriage. Louisiana: adultery, habitual intemperance, cruelty, sentence to an ignominious punishment, desertion for five years, fleeing from justice when charged with an infamous offence. Maine: insanity or idiocy, sentence to imprisonment for life; and a divorce may be decreed when the judge deems it reasonable and proper, conducive to domestic harmony, and consistent with the peace and morality of society. Maryland: impotence, adultery, three years' desertion, unchastity of the woman before marriage unknown to the husband. Massachusetts: adultery, impotence, insanity or idiocy at marriage, uniting with a religious sect that professes to believe the relation of husband and wife void or unlawful and refusing cohabitation for three years, sentence to confinement for five years or more, desertion for five consecutive years. Michigan: adultery, impotence, sentence to imprisonment for three years or more, desertion for two years, habitual drunkenness, extreme cruelty, gross, wanton, and cruel neglect or refusal by the husband to provide for the wife. Minnesota: adultery, impotence, cruel and inhuman treatment, sentence to imprisonment in the state prison, wilful desertion for three years, habitual drunkenness for a year, cruelty. Mississippi: impotence, adultery, sentence to the penitentiary, desertion for two years, habitual drunkenness, habitual cruel and inhuman treatment, pregnancy unknown to the husband at the time of marriage, insanity or idiocy of one party at the time of marriage unknown to the other. Missouri: impotence, desertion for a year, adultery, conviction of felony or infamous crime, habitual drunkenness for a year, cruelty or indignities that render life intolerable, the husband becoming a vagrant, pregnancy by another than the husband without his knowledge at the time of the marriage. Nebraska: adultery, impotence, sentence to imprisonment for three years or more, desertion for two years, habitual drunkenness, extreme cruelty, consent obtained by force or fraud. Nevada: impotence, adultery, desertion for two years, conviction of felony or infamous crime, habitual gross drunkenness incapacitating the party from contributing to support of family, extreme cruelty, neglect of husband for two years to provide necessities. New Hampshire: impotence, adultery, extreme cruelty, actual imprisonment on conviction of crime for more than a year, treatment that seriously injures health or endan-

gers reason, three years' absence not heard from, habitual drunkenness for three years, joining a religious society which professes to believe the relation of marriage unlawful and refusing cohabitation for six months, abandonment for three years with refusal of cohabitation, refusal of the husband to provide for the wife for three years. New Jersey: adultery, desertion for three years. New York: adultery of either party (the sole cause occurring after marriage), impotence, idiocy, or lunacy at the time of marriage, consent obtained by force or fraud. North Carolina: impotence, abandonment, and living in adultery, "or any other just cause for a divorce." Ohio: three years' desertion, adultery, impotence, extreme cruelty, fraudulent contract, gross neglect of duty, habitual drunkenness for three years, imprisonment under criminal sentence. Oregon: impotence, adultery, fraudulent contract, sentence for felony, habitual drunkenness for two years, desertion for three years, cruel and inhuman treatment or indignities rendering life burdensome. Pennsylvania: impotence, adultery, desertion for two years, cruel treatment or indignities that render the condition intolerable and life burdensome, fraud, force, or coercion in procuring the marriage, sentence to two years' imprisonment for felony, becoming a lunatic or *non compos mentis*. Rhode Island: impotence, adultery, extreme cruelty, desertion for five years, or less in the discretion of the court, continued drunkenness, neglect or refusal of the husband to provide necessities, gross misbehavior and wickedness in either party repugnant to or in violation of the marriage contract. South Carolina: adultery, desertion for two years; and the deserting party may have divorce if the desertion is justified by cruel treatment, or by neglect of the husband to provide maintenance. Tennessee: impotence, adultery, desertion for two years, conviction of an infamous crime or of felony, malicious attempt upon the life of the spouse, pregnancy by another person at the time of the marriage without the husband's knowledge, cruelty, indignities by the husband to the wife forcing her to withdraw from him, abandonment of the wife or turning her out of doors and refusal to provide for her. Texas: impotence, adultery of the wife, desertion, adultery of the husband and abandonment of the wife for three years, cruelty. Vermont: idiocy or lunacy at marriage, adultery, sentence to imprisonment for three years or more with actual confinement, intolerable severity, desertion for three years, absence for seven years without being heard from, neglect of the husband to provide maintenance. Virginia: adultery, impotence, sentence to the penitentiary, fleeing from justice for a felony and remaining absent for two years, desertion for five years, pregnancy at the time of the marriage by some person other than the husband without his knowledge, prostitution by the wife before marriage without the husband's knowledge, convic-

tion of an infamous offence before marriage without the other's knowledge. West Virginia: adultery, impotence, sentence to confinement in the penitentiary, desertion for three years, pregnancy at the time of the marriage by some person other than the husband without his knowledge, prostitution by the woman before marriage without the husband's knowledge, notorious licentiousness on the part of the husband before marriage without the wife's knowledge, conviction of an infamous offence before marriage without the other party's knowledge. Wisconsin: adultery, impotence, sentence to imprisonment for three years or more, desertion for a year, cruel treatment, habitual drunkenness for a year, voluntary separation for five years, neglect of the husband to provide a maintenance, or such conduct toward the wife as renders it unsafe and improper for her to live with him.—The subject of divorce has been extremely troublesome in the United States, owing to the diversity of laws, and the facility with which parties might pass from one state to another and obtain divorces without the knowledge of other parties concerned. Some very nice questions have arisen and been passed upon; and though the decisions are not wholly harmonious, the following may be stated as the general conclusions: 1. A *bona fide* residence of either party in any state will authorize such party to institute a proceeding for divorce in its courts for any cause permitted by its laws, whether arising there or elsewhere. 2. An attempt by one not a resident to institute such proceedings is a fraud upon the law and upon the other party, if such other party is ignorant of it; and the courts get no jurisdiction of such proceedings, and their decree, if one is made, is inoperative, and may be treated elsewhere as void. 3. If a *bona fide* resident institutes proceedings, but service cannot be made upon the other party by reason of absence from the state, it is competent to provide by law for service by publication, and such publication will be sufficient for the purposes of a dissolution of the marriage, but not sufficient for other purposes; as, for instance, the passing of a decree for alimony, or of an order for the custody of children. Before a party can be bound in such matters, he must have personal notice. 4. A divorce once granted with competent jurisdiction in one state is valid in any other state or country, and it leaves both parties at liberty to marry again, unless the statute where the divorce is granted otherwise provides; and even then it is presumed such statute could have no force beyond the limits of the state. It was formerly held in England that a marriage contracted in that country could not be dissolved elsewhere, and this led to serious contentions; but the contrary is now settled by the house of lords (9 Bligh's Reports, 79).

DIX, Dorothea Lynde, an American philanthropist and author, born in Worcester, Mass.

Left an orphan at an early age, she established in Boston a school for girls. She soon became interested in the condition of the unfortunate and criminal classes, and for many years was in the habit of visiting public institutions and ministering to the necessities of their inmates. In 1834 she went to Europe to investigate the methods of treatment for prisoners, paupers, and the insane. Returning in 1837, she visited all the states, and her exertions contributed greatly to the establishment of state asylums for lunatics in several of them. In 1848, and again in 1850, she petitioned congress for an appropriation of public lands to endow hospitals for the indigent insane. In 1854 a bill was passed granting 10,000,000 acres for this purpose; but it was vetoed by President Pierce. During the civil war she was superintendent of hospital nurses, having the entire control of their appointment and assignment to duty. After its close she resumed her labors for the insane. She has published several books, chiefly before entering upon her special work, including "Garland of Flora," "Private Hours," "Alice and Ruth," "Conversations about Common Things," and "Prisons and Prison Discipline." She has also written tracts for prisoners, and reports on philanthropic subjects.

DIX, John Adams, an American soldier and politician, born in Boscawen, N. H., July 24, 1798. During the war of 1812-'15 he served on the frontier with the rank of ensign and as adjutant of a battalion. He established himself about the year 1828 as a lawyer at Cooperstown, N. Y., and became identified with the democratic party. In 1830 he was appointed adjutant general, and in 1833 secretary of state and superintendent of common schools. In 1842 he was elected to the assembly; and in 1845 he was chosen to fill a vacancy in the United States senate, caused by the election of Silas Wright as governor. On the question of slavery he was the exponent of the views of the free-soil section of the democratic party in New York, whose candidate for governor he was in 1848, but was defeated. In 1853 he was made assistant treasurer of the United States in the city of New York, but soon resigned. On Dec. 10, 1860, Howell Cobb resigned his post as secretary of the treasury, and Mr. Dix was appointed in his place. New Orleans was at the time in virtual possession of the secessionists; two revenue cutters were there, and the new secretary ordered them to New York. The captain of one of them, after consulting with the collector at New Orleans, refused to obey. Secretary Dix thereupon telegraphed to the lieutenant to arrest the captain, and to treat him as a mutineer in case he offered any resistance, closing his despatch with the words, "If any one attempts to haul down the American flag, shoot him on the spot." When the civil war broke out, Mr. Dix was appointed major general of the New York militia, and on May 16,

1861, major general of United States volunteers. He was placed in command of the department of Maryland, and in 1862 was transferred to Fortress Monroe, having the command of the seventh army corps. In 1863 he was stationed at New York, where he was military commander during the riots which ensued upon the president's order for the draft. During 1864-'5 he commanded the department of the east. In September, 1866, he was appointed minister to France, which place he resigned in 1868, and returned to New York. In 1872 he was nominated by the republican party as governor of New York, and was elected. He is the author of "Resources of the City of New York" (1827); "Decisions of the Superintendent of Common Schools of New York, and Laws relating to Common Schools" (1837); "A Winter in Madeira" (1851); "A Summer in Spain and Florence" (1855); and two volumes of "Speeches."

DIX, Morgan, an American clergyman, son of the preceding, born in New York, Nov. 1, 1827. His early education and training were received in Albany, where he resided till 1842. He graduated at Columbia college in 1848, and from 1849 to 1852 studied theology in the general theological seminary of the Episcopal church. He was ordained deacon in 1852, and priest the next year. In September, 1855, he became an assistant minister of Trinity church, New York; he was chosen assistant rector of that parish in 1859, and on Dr. Berrian's death became rector, Nov. 10, 1862. He is a trustee of Columbia college, and holds a prominent place in the management of affairs in the Episcopal church in New York. He has published "A Commentary on the Epistle to the Romans," "An Exposition of the Epistles to the Galatians and Colossians," "Lectures on the Pantheistic Idea of an Impersonal Substance Deity," "Essay on Christian Art," "Lectures on the two Estates, that of the Wedded in the Lord and that of the Single for the Kingdom of Heaven's Sake," several manuals of devotion, and occasional sermons.

DIXON, a N. E. county of Nebraska, separated from Dakota on the N. E. by the Missouri river, and watered by several streams; area, 700 sq. m.; pop. in 1870, 1,345. The surface is level. The soil rests upon limestone rock, and is fertile. The chief productions in 1870 were 27,923 bushels of wheat, 19,725 of Indian corn, 11,135 of potatoes, and 4,574 tons of hay. The total value of live stock was \$96,511. Capital, Ponca.

DIXON, George, an English navigator, born in 1755, died about 1800. He sailed in Cook's third expedition. On his return he was made captain in the navy, and in 1785 in concert with Capt. Portlock sailed on a new expedition, with two vessels, under the auspices of the Nootka sound company. In the course of their joint explorations they discovered a number of harbors, ports, bays, and small islands

on the coast of North America, and arrived at Hawaii, Sept. 28, 1786, whence Dixon proceeded to China, and in 1788 returned to England. He is the author of a description of his own expedition, under the title of "A Voyage round the World, but more particularly to the N. W. Coast of America" (1789); "Voyage of Meares" (1790-'91); and "The Navigator's Assistant" (1790).

DIXON, James, an English clergyman, born in Leicestershire in 1788, died at Bradford, Yorkshire, Dec. 28, 1871. In 1812 he entered the Wesleyan conference, and continued in the itinerant ministry till 1824, when he was sent as a missionary to Gibraltar. In 1825 he labored at Wakefield; in 1828 he preached in London, where he remained till 1833. After a term of pastoral service in Liverpool, he was appointed successively superintendent of the Sheffield and Manchester circuits. In 1841 he was chosen president of the British conference, and in 1848 he was elected by the Wesleyan conference a delegate to the general conference of the United States. He published "Methodism in its Origin, Economy, and Present Position;" "Memoir of the Rev. William E. Miller;" "Notes on America;" "The Present Position and Aspects of Popery, and the Duty of Exposing the Errors of Papal Rome;" and "Letters on the Duties of Protestants with regard to Popery."

DIXON, William Hepworth, an English author, born in Yorkshire, June 30, 1821. He entered a mercantile house in Manchester when 14 years of age, but early contributed some fugitive poems to several periodicals, wrote a tragedy which was printed privately, and became at length literary editor of a paper at Cheltenham. In 1846 he removed to London, and entered as a law student at the Inner Temple. In 1849 he published a memoir of John Howard, and followed this by various publications, becoming well known as an author. He was a deputy commissioner of the world's fair of 1851. The next year he made a tour of the continent, and in 1853 became chief editor of the "Athenæum," which post he held till 1869. In 1864 he travelled in the East, and on his return assisted in founding the Palestine exploration fund. In 1866 he travelled in the United States, and visited the Mormons in Salt Lake City. Subsequently he made a journey through Russia. In 1869 he was appointed a magistrate for Middlesex, and in 1870 was elected a member of the London school board. His more important works are: "John Howard," which reached three editions in the first year, and many later editions in England and the United States; "London Prisons" (1850), which first appeared in the "Daily News;" "William Penn, an Historical Biography" (1851; 2d ed., 1856, including a reply to Macaulay); "Robert Blake" (1852); "Personal History of Lord Bacon" (1861), which first appeared in the "Athenæum;" "Lives of the Archbishops of York" (1863); "The Holy Land" (1865);

"New America" (1867), of which eight editions appeared in England, three in America, and several in France, Germany, Holland, and Russia; "Spiritual Wives" (1868), from his observations among the Mormons; "Free Russia" (1870); "Her Majesty's Tower" (4 vols., 1869-'71); "The Switzers" (1872); and "History of Two Queens: I. Catharine of Aragon; II. Anne Boleyn" (2 vols., 1873). The *Revue positive* of Paris published from him in 1869 a contribution entitled *Les sectes religieuses en Amérique*.

DIXWELL, John, one of the regicide judges of Charles I., born in 1608, died at New Haven, Conn., March 18, 1689. After the reaction in England which placed Charles II. upon the throne, and caused himself and his associates to be condemned to death, he escaped to America, took the name of John Davids, and lived undiscovered in New Haven, where he was married and left children. In 1664 he visited two of his fellow regicides, Whalley and Goffe, who had found a refuge at Hadley, Mass. His favorite study in exile was the "History of the World," which Raleigh had written in prison, and he cherished a constant faith that the spirit of liberty in England would produce a new revolution.

DIMITROV, a town of Russia, in the government and 40 m. N. of the city of Moscow; pop. in 1867, 8,042. It has a college, a convent, and several churches, and manufactories of cotton, woollen, linen, and silk goods, and leather. An annual fair, lasting a week, is held here. The town covers considerable ground, much of it occupied by gardens, but the houses generally are poor.

DNIEPER (Russ. and Pol. *Dniepr*; anc. *Borysthenes*, also *Danapris*), next to the Volga the largest river of Russia in Europe. It rises on the S. slope of the Volkonsky plateau, near Dnieprovo in the government of Smolensk, flows S. between woody marshes as far as Dorogobush, thence mainly W. between more elevated banks past Smolensk to Orsha, there turns S., passes through the valleys and plains of the government of Mohilev down to Kiev, then turns S. E. through the steppes of the Ukraine, passes by Kremenchug and Yekaterinoslav, flows S. as far as Alexandrovsk, then S. W. to its mouth below Kherson, emptying into the Black sea between the fortresses of Kinburn and Otechakov. Its whole course is about 1,200 m. Its chief tributaries are, on the west, the Beresina, the Pripet, which discharges into it the waters of the Lithuanian marshes, and the Inguletz; on the east, the Desna, Sozh, and Vorskla. The Dnieper was formerly hardly navigable, owing to natural obstructions in its lower course and at the mouth. Some of these have been removed by the Russian government, but its commercial importance is still lessened by its frequent shallowness. About lat. 48° 20' it commences a course of more than 40 m. over a rugged bed of granite, forming below Yekaterinoslav a number

of cataracts and rapids, and separates into a great number of courses, embracing many woody islands. Renning, it becomes navigable in its lower course for flat-bottomed vessels, among which steamboats have been employed since 1838 in carrying the produce of the interior, timber, corn, linen, iron, and coal, to the Black sea. The Beresina, Oginski, and Royal canals, connecting tributaries of the Dnieper with the Duna, Niemen, and Bug, form communications through these rivers between the Baltic and Black seas. The estuary or frith (Russ. *liman*) formed by the mouths of the Dnieper and by that of the Bog is very shallow, and emits noxious exhalations in summer. The Dnieper abounds in sturgeon, carp, pike, and shad. In its course it passes through the most fertile provinces of Russia, and through different climates. At Smolensk it is ice-bound from November to April, and at Kiev from January to March. The most remarkable bridges are in these two cities. At the latter is a magnificent suspension bridge half a mile long, completed in 1852. On the Kiev side is a drawbridge, with an opening 50 ft. wide. The ancients regarded the Borysthenes as the largest river of the world next to the Nile, and entertained an exaggerated opinion of the fertility of the surrounding country. They knew only its lower course. Near its mouth was Olbia, or Olbiopolis, a colony of Miletus, which carried on trade with the nomadic tribes of the interior.

DNIESTER (Pol. and Russ. *Dniestr*; anc. *Tyras* and *Danaster*), a river of eastern Europe, which has its source in a small lake on the N. E. slope of the Carpathian mountains, S. W. of Lemberg in Galicia, and flows mostly S. E. about 600 m. As far as Old Sambor it passes through a broad valley, which afterward expands into an extensive plain on the east, while spurs of the Carpathians here and there skirt the W. banks. At Khotin, where it enters Russian territory, it flows through an open flat country separating the province of Bessarabia from Podolia and Kherson on the east, and then discharges into the Black sea by a shallow liman 19 m. long and 5 broad, between Akerman and Ovidiopol. It receives a number of tributaries in Galicia, the principal of which are the Stry, Strypa, and Sered, and only a few insignificant ones during its course through Russia. Its current is rapid, and navigation is interrupted between Yampol and Bender by two falls and several whirlpools, and its mouth is encumbered with flats and sand banks. Wood, grain, and other products are carried down it toward Odessa.

DOAB (Sanskrit, two waters), a name given in Hindostan to any tract included between two rivers. It is especially applied to that lying between the Ganges and the Jumna, and when applied to other similar districts is joined with some distinctive appellation, as the Julunder Doab, between the Beas and the Sutlej, and the Rukna Doab, between the Ravee

and the Chenaub. The Doab is a large tract reaching from Allahabad in the south to Saharunpore in the north, and forming the finest and most fertile part of the province of Agra. It contains many thriving towns, and the whole territory has been brought into a highly productive state by a system of irrigation. It has a British military station and a strong fort.

DOANE, George Washington, an American bishop, born at Trenton, N. J., May 27, 1799, died at Burlington, N. J., April 27, 1859. He graduated at Union college in 1818, was admitted to holy orders in 1821, officiated for three years in Trinity church, New York, and in 1824 was appointed the first professor in Washington (now Trinity) college, Hartford. In 1828 he became assistant minister, and afterward rector of Trinity church, Boston, where he remained till 1832, when he was elected bishop of New Jersey, whereupon he removed to Burlington, and became rector of St. Mary's church in that city. Here he devoted his energies to the establishment of a comprehensive system of Christian education for females, and opened in 1837 St. Mary's hall, a boarding school for girls, beautifully situated on the shore of the Delaware. In consequence of the great success of this enterprise, he founded Burlington college in 1846. Under his episcopate the church in New Jersey experienced an unexampled increase in the number of its communicants, from 801 in 1832 to 4,500 in 1858, while the clergy increased from 14 to 90 in the same period, and the number of parishes from 31 to 79. In 1824 he published a volume of poems entitled "Songs by the Way." A volume of his sermons was issued in London in 1842. His life has been written by his son, W. C. Doane, who has also edited his "Poetical Works, Sermons, and Miscellaneous Writings" (4 vols., 1860).

DOBBERAN, or **Doberan**, a watering place of Germany, in the grand duchy of Mecklenburg-Schwerin, on the Baltic, 9 m. W. N. W. of Rostock; pop. about 4,000. It contains two palaces, with fine pleasure grounds, a theatre and other places of recreation, and one of the most remarkable Gothic churches of northern Germany. The bathing establishment is three miles from the town, at the Heilige Dam, a huge embankment said to have been thrown up by the sea in a single night.

DOBELL, Sydney, an English poet, born near London, April 5, 1824, died Aug. 24, 1874. In 1835 his father, a wine merchant in London, removed his business to Cheltenham. At the age of 12 he entered the counting room of his father, with whom he remained as a clerk for 12 years, devoting his leisure hours to literary pursuits. In 1848 he removed to Leekhampton, Gloucestershire, where he wrote his dramatic poem, "The Roman," published in 1850 under the *nom de plume* of "Sydney Yendys." In 1854 he published "Balder." These poems found many admirers, who hailed the author as the originator of a new era in English poetry.

They were, however, severely criticised, and were travestied by Aytoun in his "Fermilian." In 1855 Mr. Dobell united with Alexander Smith in a volume of "Sonnets on the War," and in 1856 in a series of poems under the title of "England in Time of War." In 1865 he wrote a pamphlet on "Parliamentary Reform," advocating a graduated suffrage and the system of a plurality of votes. In 1871 he produced "England's Day," a volume of lyrics against what he regarded as the hostile attitude of Germany, Russia, and the United States.

DÖBELN, a town of Saxony, on the Mulde and on the railway from Chemnitz to Riesa, 36 m. S. E. of Leipsic; pop. in 1871, 10,078. It has a high school, two churches, a hospital, and manufactories of cloth, leather, brassware, and hats. It is also the centre of a considerable trade in cattle and grain, and has three annual fairs. The town is well built, on an island formed by the Mulde and Mählgraben.

DÖBEREINER, Johann Wolfgang, a German chemist, born near Hof, Dec. 15, 1780, died in Jena, March 24, 1849. He was professor of pharmacy and chemistry in the university of Jena from 1810 till his death, and had intimate relations with Goethe and the grand duke Charles Augustus of Weimar; their correspondence with him was published in 1856. He made several chemical discoveries, among them the combustibility of platinum, the apparatus for suddenly producing light by directing a jet of hydrogen upon a piece of platinum sponge being known as Döbereiner's lamp. His principal works are: *Zur pneumatischen Chemie* (5 vols., Jena, 1821-'5), *Zur Gährungschemie* (1822), and *Zur Chemie des Platins* (Stuttgart, 1836). With his son FRANZ, the author of *Kameralchemie* (Dessau, 1851), he published *Deutsches Apothekerbuch* (3 vols., Stuttgart, 1840-'44).

DÖBRENTEL, Gábor, a Hungarian author, born at Nagy-Szöllös in 1786, died in 1851. He studied at Wittenberg and Leipsic, and in 1810 established the "Transylvanian Museum," a periodical which exercised considerable influence upon the Hungarian literature of the period. In 1820 he removed to Pesth, and in 1827 was one of 22 savants invited to assemble at Buda to devise a plan and constitution for the Hungarian academy. Of the great work of his life, the "Ancient Monuments of the Hungarian Language," four volumes were published by him and a fifth was left nearly completed. His poems, which consist of odes, epigrams, and elegies, have been translated into several languages. He translated some of Shakespeare's plays, Molière's *Avare*, and several tragedies of Schiller into Hungarian.

DOBRIZHOFFER, Martin, a Jesuit missionary, born at Gratz, Styria, in 1717, died in Vienna, July 17, 1791. He was sent to South America in 1749, and passed 18 years among the Indians inhabiting the W. bank of the Paraguay river and the interior of Paraguay. When the Jesuits were expelled from the Spanish colonies he went

to Vienna, where he enjoyed the favor of Maria Theresa. His principal work is a history in Latin of the Abipones (Vienna, 1784), of which a German translation appeared in Pesth in the same year, and an English translation by Miss Sara Coleridge in London in 1822.

DOBRODJA. See DOBRUDJA.

DOBROVSKY, Jozef, a Slavic scholar, born near Raab, Hungary, Aug. 17, 1753, died in Brünn, Moravia, Jan. 6, 1829. He early applied himself to the study of the German language, and acquired afterward still greater knowledge of the Bohemian. He studied at the university of Prague, became a Jesuit at Brünn in October, 1772, and after the dissolution of that order in July, 1773, devoted himself to literature. From 1780 to 1787 he conducted a journal devoted to the literature of Bohemia and Moravia. His subsequent works on the Slavic languages and history gained him the reputation of having laid the foundation of Slavic philology. The most celebrated of them are the *Geschichte der böhmischen Sprache* (1792), *Entwurf zu einem allgemeinen Etymologikon der slavischen Sprachen* (1813), and *Institutiones Lingue Slavicæ Dialecti veteris* (Vienna, 1822). In 1792 and 1794 he visited Sweden, Russia, and western Europe, to collect documents bearing upon Slavic history. On his return he was for several years afflicted with insanity, brought about by the intensity of his labors, but recovered his health in 1803. An account of his life and writings was published by Palacky at Prague in 1833.

DOBRUDJA, the N. E. portion of Bulgaria, Turkey, on the right side of the Danube, extending from Silistria and Varna to the mouth of that river, offering the most accessible military route from the north to Constantinople. The Russians commenced here their operations against Turkey in 1828; and again in 1854, having crossed the Danube at Braila and Galatz, they gained an important advantage by securing Matchin, one of the principal towns of the district. It was restored to Turkey by the treaty of peace of 1856. The population consists of 16,000 to 20,000 families of Bulgarians, Tartars, Cossacks, Turkomans, Armenians, Greeks, and Jews, who support themselves chiefly by the raising of cattle and bees, by the manufacture of salt, and by fisheries. The country is flat, containing several large swamps, and lakes on the coast. Some parts are very fertile, and produce good crops of grain; others are covered with grasses. The herbage dries up early in summer, and the flocks of sheep and herds of buffaloes go to the borders of the Danube. Trajan's wall crosses the Dobrudja about lat. 44° 10'. The most important towns are Tulcha, Kustendji, Baba Dag, and Hirsowa. A railway connects Tchernavoda on the Danube with Kustendji on the Black sea.

DOBSON, Austin. See p. 801.

DOESON, Thomas, a bookseller and author of Philadelphia, died March 8, 1823. He republished the "Encyclopædia Britannica" (21

vols. 4to, including the supplement, 1798-1803), and wrote "Letters on the Character of the Deity and the Moral State of Man" (2 vols. 12mo, 1807).

DOBSON, William, an English painter, born in London in 1610, died in 1646. He served an apprenticeship with a portrait painter and picture dealer, and availed himself of the opportunity thus offered him to copy some of the works of Titian and Vandyke. One of his pictures fell by chance under the eye of Vandyke, who was so much struck by its merit that he presented the painter to Charles I., who sat to Dobson for his picture, and upon the death of Vandyke conferred upon him the title of his chief painter. Several of his portraits are in the cabinet of the duke of Northumberland. One of his best historical pictures is the "Decollation of St. John," at Wilton.

DOCE, Rio, a river of Brazil, rising at the base of Mt. Itacolumi, S. E. of the city of Ouro Preto, province of Minas Geraes. It flows N. 180 m., then bends first E., afterward S. E., then N. E., flowing through the province of Espirito Santo, finally curves abruptly to the S. E., and falls into the Atlantic near the town of Regencia. The mouth is wide and shallow, and traversed by a bar on which the waves break with great violence, so that the entrance to the river is always difficult, and often for weeks together impossible. As far up as Porto de Souza the river is navigable all the year round by small steamers; but at that point begin the rapids which render navigation impossible save for canoes, and even these must in some parts be unloaded before hauling them over the rapids. The banks of the Doce are for the most part high and steep, bordered by mountains with a rich clothing of forest, in which abound trees furnishing many species of valuable wood. During the rainy season the Doce sometimes rises 20 feet above its ordinary level.

DOCETÆ, in the primitive church, the partisans of those doctrines which admitted the appearance but denied the reality of the human form and nature of Jesus Christ. Those who looked upon matter as essentially evil were offended at the idea of a revelation of Deity through sensible objects, and declared that everything corporeal in Christ was only in appearance, and for the manifestation of the spirit, and that his life was merely a continued theophany. It was probably against Docetic doctrines, which had appeared even in the time of the apostles, that some passages in the gospels and epistles of St. John were directed. Docetism, of which there were various forms, was itself one of the earlier forms of Gnosticism, and its teachers, as Valentinus, Cassianus, and Bardesanes, who flourished in the latter half of the 2d century, are reckoned among the Gnostics. Its purpose was to reconcile the narrative of the gospels with the respect due to the Deity, in maintaining that the sufferings and death of Christ were only apparent, in opposition to the realistic doctrine of the Ebionites.

DOCK (Gr. *δοχή*, Dutch *dok*, Ger. *Dock*, a receptacle), an artificial enclosure in connection with a harbor or river, used for the reception of vessels, and provided with gates for keeping in or shutting out the tide. There are two kinds of docks in general, wet and dry docks, the former so called because they retain their water for the purpose of keeping vessels afloat. In the United States wharves are popularly but erroneously called docks. Enclosed basins not closed by gates, in consequence of there being no necessity for it because of small tides, are called docks with better reason, as the Atlantic dock at Brooklyn, which will be described in this article, although according to the accepted definitions it should strictly be classed as a basin. The late English engineer Rankine calls a reservoir surrounded by quay walls, and having a single gate without a lock, a basin, restricting the term wet dock to a reservoir which is entered through a lock. Either kind of structure, however, is usually called a wet dock. A dry dock is one from which the water may be shut or pumped out so as to become dry, leaving a vessel in a position to be inspected or repaired. Floating docks and screw docks are varieties of dry docks by means of which vessels are raised out of the water by the buoyancy of pontoons or the application of screw power. Vessels are also drawn out upon inclined railways which are called slips; but these cannot properly be called docks, as they are not receptacles in the sense in which the word is understood.—WET DOCKS are important structures in harbors where there is considerable rise and fall of tide, serving not only to keep ships afloat, but to maintain a convenient level. They are of comparatively recent date. The Mediterranean, upon which most of the commerce of the world till within a few centuries was conducted, has so little rise and fall of tide, and the vessels used by the ancients were of so small a size, that the necessity of maintaining a level equal to that of high tide did not exist. Liverpool was the first city to embark to any extent in their construction, and for a long time her docks were unrivalled in size and magnificence. In the harbor of New York, at Philadelphia, and at Baltimore and other ports in Chesapeake bay, the rise and fall of the tides are so inconsiderable as to render such docks as those upon the Mersey and the Thames not only unnecessary but inconvenient. The Atlantic dock, therefore, has no gates. The maintaining of a level of 4 or 5 ft. above low water would doubtless often be an advantage, but the expense necessary to secure it would be greatly disproportionate. At Liverpool, however, where the difference between high and low tide is about 15 ft., and at London, where it is 18 ft., the case is different. Liverpool owes all her great commercial prosperity to the number and extent of her docks, which cover an area of over 200 acres. Without them the Mersey would never have afforded much

more than an indifferent harbor for fishing and other small vessels. In the Clyde, where the tides are small, they have not been used, although the idea of providing them has been entertained. Wet docks are constructed with a wall of masonry, or of piling with concrete and tamped clay filling, and with a clay or concrete bottom. The enclosed area may vary from four or five acres, as at Leith, to 70 or more, as the Victoria dock at London. The higher the level of the water in the dock is kept above the low or mean tide of the harbor, the stronger and more impervious the walls require to be made. When the area is not too great the water is sometimes maintained at the highest tide level by pumps, mainly to avoid the necessity of admitting too much sedimentary matter with the entrance of the tide when the water in the harbor is very turbid. In planning a dock, among other things to be considered is the proportion of the surface of water to the length of the quay walls, which should be as small as is consistent with convenience in manœuvring the vessels. The docks of Great Britain are usually entered through locks having two gates similar to those on canals. The entrance locks to the docks of London vary in width from 40 to 80 ft., and in length from 100 to over 326, depending upon the class of vessels which it is intended to accommodate. The Victoria docks comprise a tidal basin of 16 acres at the entrance from the Thames, and a main dock of 74 acres. The earthy strata which occupied the site of the dock consisted of a top soil one foot deep, a layer of clay about 5½ ft. thick, then one of peat from 5 to 12 ft., and beneath this a bed of gravel, lying upon the London clay. The dock and basin were excavated to a depth of 26 ft. below high-water mark, and its bottom puddled with clay to a depth of 2 ft., leaving the finished surface 24 ft. below Trinity high-water mark. The entrance from the river into the basin is by a lock having two pairs of wrought-iron gates, revolving in hollow quoins, the walls of the lock being constructed of cast-iron piling, T-shaped in section, backed with hydraulic concrete. The gates are what are called cylindrical in form; that is, they are portions of a cylinder, with the convexity turned toward the basin. The lock chamber is 80 ft. wide at the bottom and 326½ ft. long, including the upper and lower gate platforms upon which the gates are supported while turning upon a circular roller path. On the site of the lock the surface of the London clay was 37 ft. below high-water mark, and to this depth the excavation was carried at this point, and the foundations of the gate platforms were laid. Between the platforms the bottom of the lock was filled with clay puddle to a level of 28 ft. below high-water mark. The upper gate platform is 25½ ft. below that mark, while the lower one is 28 ft., or at the same depth as the bottom of the lock; so that, the mean fall of tide being 18 ft., there will be 10 ft. depth of

water in the dock below the upper platform at low tide. The entrance from the tidal basin into the dock is by means of a single pair of gates, similar to those of the lock, placed between two dumb jetties or walls which separate the basin from the dock. (See fig. 1.) The basin and dock are 4,050 ft. in length and 1,050 ft. in width. There are six jetties—the two just mentioned, which are each 485 ft. long, and four others extending from the north wall into the dock a distance of 581 ft., including the pointed terminations. These with the sides of the dock and basin afford nearly three miles of quay room. The four interior jetties are each 140 ft. wide for 497 ft., and the surface of the quay varies from 6 to 9 ft. above high-water mark. The side walls are vertical and constructed of cast-iron piles 7 ft. apart from centre to centre, filled in between with brick set in Roman cement, the

brickwork being arched toward the back to give strength. Behind the piles and brickwork there is a wall of concrete which was carried up from below the clay bottom, and behind this a filling of clay. The piles are T-shaped in section, and are 35 ft. long and 1 ft. wide on the face, averaging $1\frac{1}{2}$ in. in thickness, and weighing about $1\frac{1}{4}$ ton each. They are driven to a depth of 28 ft. below high-water mark, and therefore 4 ft. below the bottom of the dock. The brickwork commences one foot above the bottom, and rests upon concrete 3 ft. thick. The wall is covered with a cast-iron plate bolted to the heads of the piles, and upon these lies a timber sill. The piles in the opposite jetty walls are connected by cross bars, 5 and 17 ft. below their heads. Upon each jetty there is a warehouse 500 ft. long and 80 wide, leaving wharf room 30 ft. wide; and it is also supplied with nine hydraulic cranes, one

Fig. 1.—Plan of the Victoria Docks at London.

of five tons power at the pointed end, and eight others of two tons power each along the sides. Connected with the north side is a basin which opens into eight graving or dry docks. (For a more detailed description of this work, and also of the docks upon the Tyne, see Spon's "Dictionary of Engineering," London, 1871.) The West India docks, constructed in 1802 in a gorge in the Isle of Dogs, comprise an import dock of 30 acres, an export dock of 25 acres, communicating with the Thames at Blackwall, and a bonded timber dock of 19 acres. The gates are 45 ft. wide, admitting vessels of 1,200 tons. The whole space occupied by docks and warehouses is 295 acres. The East India docks, also at Blackwall, completed in 1806, belong to the same company as the former. They include an import basin of 18, an export basin of 9, and an entrance basin of $2\frac{1}{4}$ acres. The gates are 48 ft. wide, and the depth of water 23 ft. The Commercial docks, situated on the

opposite side of the river, existed in 1660 under the name of the Howland great wet dock, and subsequently of the Greenland docks, having been prepared for the accommodation of the Greenland whaling vessels. In 1807 they were greatly enlarged and received their present name, and are now used chiefly to receive vessels laden with corn, iron, lumber, guano, and other bulky articles. They cover an area of 120 acres, 70 of which are water. The granaries will contain 140,000 quarters of corn. The other principal docks here are the London and the St. Katherine docks, the latter situated between the former and the tower. The warehouses in the St. Katherine docks are built upon the water's edge, without a quay; but this plan has since been disapproved on account of interference with the ships' rigging. The docks at Liverpool were authorized by an act of parliament in 1708. There are numerous other mercantile wet docks in Great Britain, a list of which, including entrance basins pro-

vided with locks, at the principal ports, is appended :

PORTS.	No.	Area in acres.
London.....	23	850
Liverpool.....	33	206
Birkenhead.....	4	142
Bristol.....	4	79
Hull, exclusive of timber pounds.....	7	46½
Great Grimsby.....	2	51
Hartlepool.....	1	20
West Hartlepool, exclusive of timber pounds.....	3	82
River Wear.....	2	41
River Tyne.....	4	107
Leith.....	3	15½
Dundee.....	4	34
Aberdeen.....	1	35

—The docks at Cherbourg were commenced by Napoleon I., and the first basin was opened in August, 1813. (See CHERBOURG; also for notices of other docks, see the articles on the places where they are situated.)—The Atlantic dock at Brooklyn, technically a tidal basin, was constructed by the Atlantic dock company, chartered by the state legislature in 1840. The work was commenced in 1841, and

FIG. 2.—Plan of Atlantic Dock.

occupied several years. Over 200 acres of land were purchased at a point on the Long Island shore opposite Governor's island, and 60 acres of the low land and marsh were converted into a basin having 40 acres of water surface.

The enclosure on the water side was made with cribwork piers consisting of timber filled with stone, sunk in trenches 30 ft. below high-water mark. The cribs were 25 ft. thick at the base, and were placed with their external sides 150 ft. apart, that being the width of the pier, the top of which is 10 ft. above low-water mark. The space between them was filled with sand and gravel from the excavations in the basin. Piles were driven into the filling to a sufficient depth and sawn off 5 ft. below the surface; and upon the heads of the piles the stone foundations of the warehouses were placed. The entrance is between the north and south piers, and is 200 ft. wide. The excavation over the whole 40 acres was made principally with dredging machines working by means of an endless chain, and was carried to an average depth of 20 ft. below low-water mark, or 25 ft. below high-water mark. In the basin, reaching from either end, are wooden piers of sufficient width for the unloading of ships, built of piles covered with timber and planking. Upon the cribwork piers, one of 1,070 and the other of 1,000 feet in length, there are commodious stone warehouses, 100 ft. in depth and extending the length of the piers. Upon the opposite or inland side of the basin is the commercial wharf, 2,000 ft. in length, and upon this there are three blocks of warehouses, each 460 ft. long and 180 ft. deep, besides an iron yard of the same dimensions. There are several grain elevators situated upon different parts of the wharves. A plan of the dock is given in fig. 2; for a further description and a perspective view, see BROOKLYN.—DRY DOCKS, often called graving docks, because used for graving or cleaning the bottoms of ships, consist, as before stated, of those which are pumped dry and those which discharge the water by being raised. The former are usually built of masonry, but are sometimes constructed of piling, concrete, and clay puddling. Two of the latter kind were constructed at the Erie basin, near the Atlantic dock, which are 500 ft. in length by 90 in width at top and 480 by 50 ft. at bottom, and 30 ft. deep. The dry dock at the Brooklyn navy yard is the finest structure of the kind in the United States. It was commenced in August, 1841, and completed in August, 1851. The construction of the coffer dam and the excavation which initiated the work are described in the article DAM. The main chamber of the dock, fig. 3, *a*, is 286 ft. long and 30 ft. wide at the bottom, and 307 ft. long and 98 ft. wide at the top, this being the distance between the folding gates *g g* and the head of the dock *c*. Behind the folding gates is what is called the lock chamber, *c*, 52 ft. long, which length may be added to the dock when it is required, a caisson, *d*, forming the external gate being sufficient to exclude the water. The bottom is 26 ft. below mean high tide, and 30 ft. 8 in. below the coping. The foundation had to be constructed in quicksand, and consisted of piling driven to great depth, covered

FIG. 3.—Plan of Brooklyn Dry Dock.

with 18 in. of hydraulic concrete, this covered with cross timbers of yellow pine 12 in. square, and this again with 3 ft. granite blocks laid in hydraulic cement. A cross section is represented in fig. 4. The walls, composed of heavy granite blocks laid in hydraulic cement, are carried up vertically from this foundation, and are 108 ft. from outside to outside, being 5 ft. thick at the coping and 39 ft. at the bottom or lower step, and varying in thickness

FIG. 4.—Transverse Section of Brooklyn Dry Dock.

between these two points in accordance with the curve, which is irregular and made to correspond with the general curve of the side of a ship. The distance between the quoins in which the folding gates revolve is 66 ft., and this is about the average width of the lock chamber, and also of the length of the deck of the caisson or outer gate, which has also a beam of 16 and a depth of 30 ft. Two culverts, *c, c*, one on either side of the entrance and below the surface at low tide, admit water and carry it in a descending course to the bottom of the dock a few feet in front of the inner gates. These culverts have a calibre of 4 ft. 9 in. vertical by 2 ft. 5 in. horizontal. At the points where they enter the dock commence the discharge culverts, which are carried on either side to a point beyond the head, where they unite and empty into a well under the engine house. From this well the water is pumped into a culvert which descends to the river and discharges at a point near the entrance of the dock. The pumping engine can empty the dock in 2h. 10m., its capacity when filled by the tide being about 600,000 cubic feet. When a ship is docked, the filling culverts are closed, as well as the passages from the dock chamber to the draining culverts leading to the pump well, and the water is pumped from the latter; the ship is then admitted and placed over the keel block in the centre of the dock; the caisson is next floated to its place, over the recess or groove, and filled with water until it sinks down to the bottom of the masonry fitted to receive its keel; after which the turning gates are closed by men standing on the bridge, and working the four hand wheels that move the machinery. The culvert gates in the dock chamber are next drawn and the water is allowed to flow into the draining culvert and well, by which means

the water is lowered several inches in the dock in a few minutes, thus hastening the shoring and producing an immediate pressure on the gates, so as to effectually prevent the admission of water and fix them steadily. A complete command of the level at the moment the gates are closed, or when a ship, especially a large one, is about to touch the blocks and requires the placing of shores, is important; and the above method gives a more perfect control of the operation for the first foot than could be obtained by the best regulated pumps and machinery for driving them.—There are also naval dry docks at the navy yards of Boston, Portsmouth, Norfolk, Pensacola, and San Francisco. The Boston dry dock, situated at Charlestown, is of granite, 256 ft. long and 86 ft. wide, with a depth at mean high tide of 25 ft. The length of the dock may be increased 53 ft., like the one at Brooklyn, by leaving open the turning gates and using the caisson alone. It was commenced in 1827 and finished in 1834. The dry dock at Norfolk, Va., built at the same time, is also of granite. Before its completion the ship of the line Delaware was docked in it in 1833, on the anniversary of the battle of Bunker Hill (June 17), being the first national ship ever docked in a United States dry dock. Its dimensions and construction are like those of the Boston dock.—There are 11 dry docks at the Portsmouth navy yard, England; among them two (double locks), each 644 ft. long, with gates 80 and 88 ft. in width and a depth of water at highest tides of 25 and 27 ft.; and another 426 ft. long, with gates 70 ft. wide, and a depth of 25 ft. 9 in. at high tide. At Devonport there are five dry docks, one 437 ft. long, with an entrance 73 ft. wide, and a depth of water at high tide of 31 ft. There are 18 dry docks at Liverpool, some of them over 500 ft. long, the Canada graving dock having an entrance width of 100 ft. and a maximum depth of water of 26 ft. At Birkenhead there are six dry docks, two of them 750 ft. long at the bottom, with gates 85 and 50 ft. wide, and a depth of 29 ft. 9 in. at high water. There are numerous other magnificent structures in other parts of the kingdom. The number of floating basins in the English government dockyards is 11, comprising a total area of 35 acres, and having a lineal quay space of 13,500 ft. The dry docks at Sebastopol, which were mainly destroyed after the capture of the city, Sept. 8, 1855, were situated considerably above the level of the Black sea, and the expense of pumping was entirely avoided; ships were raised into a general dock basin by a series of three locks, each of which had a rise of 10 ft. The water for supplying the basin, for filling the docks, and for working the locks, was brought by a canal 12 m. long, which taps a mountain stream. Vessels, after being elevated into the general basin, were floated into one of these dry docks, and, the gates being closed, the water was let off into the sea through a subterranean culvert.—A floating

dry dock, called a balance dock, and which was patented by John S. Gilbert of New York, consists of a pontoon divided into compartments, which may be so filled with either air or water as to preserve a balance of position, and by its buoyancy to be capable of raising vessels. It may be built of timber and planking, or of wrought iron and planking. Those which are used in New York have the framework entirely of wood, and one of them has been in use for nearly 30 years. The pontoons may be from 8 to 12 ft. in depth, and 100 or more in breadth by 350 or more in length. They are strongly girded and trussed, and have a strong bulkhead running through the middle for the whole length, upon which the keel of the vessel is supported by keel blocks. At either side the dock rises into walled chambers, which may be also filled with water or air, and upon the deck of which are placed steam engines for the purpose of pumping the water from the interior. The ends of the dock are left open, so that when the vessel is raised the water readily flows from the dock. Fig. 5 represents the larger of two docks owned by the New York balance dock company. It is 325 ft. long, 100 ft. wide, and 30 ft. from deck of pontoons to

FIG. 5.—Balance Dock.

deck of side walls, or 40 ft. in all, the pontoons being 10 ft. deep. It has 8 gates on either side for admitting, and 8 others for discharging water, which is pumped out by steam engines, one upon either wall, of 40 horse power each. The pumps are 14 in number, 7 on either side, of 36 in. diameter and 35 in. stroke, capable of exhausting with sufficient rapidity to raise a vessel of 3,000 tons in an hour and a half. Its total lifting power is estimated at 8,000 tons. In docking a vessel on the balance dock, the pumps are first set in motion by the steam engines on the deck above, and the discharge opening being closed by a gate for that purpose, the water rises in the chamber above the pumps until it is full to the deck of the dock. It is next allowed to flow into the upper chamber of the dock until its weight, acting as ballast, sinks the dock to the required depth. When the ship is floated into the dock, this ballast is drawn off by means of valves, causing the dock to rise by its own specific gravity until it touches the bottom of the ship, after

which the vessel is lifted by pumping the water out of the side chambers and bottom tank; and as the dock rises, the water around the ship in the middle chamber ebbs out, so that

FIG. 6.—Transverse Section of Rennie's Floating Dock.

the quantity of water to be exhausted in raising a vessel is in proportion to her weight and not to her bulk.—Fig. 6 represents a cross section of an iron floating dock, built mainly upon the same principle as the New York floating dock, differing however in having air chambers in the upper part of the walls, by means of which the depth of sinking is controlled. It was constructed by Mr. G. B. Rennie for the port of Ferrol on the N. W. coast of Spain. It is 350 ft. long, 105 ft. wide, and 50 ft. high in extreme dimensions. The depth of the pontoon is $12\frac{1}{2}$ ft., leaving a height of $37\frac{1}{2}$ ft. from the deck of the pontoon to the deck of the side walls, so that if the keel blocks occupy 5 ft. and the deck remains $4\frac{1}{2}$ ft. above water, there will be a clear depth of 28 ft. of water for the admission of ships. The total weight of the dock is about 5,000 tons, and the displacement by the pontoon is equal to 13,000 tons, leaving a lifting power of 8,000 tons. It is constructed of plate, angle, and T iron, riveted together in one structure. The pontoon is divided by a water-tight bulkhead running the whole length, each half being subdivided by 10 transverse bulkheads. The upper part of the side walls is composed of air-tight chambers having a capacity sufficient to prevent the dock from sinking below any desired level. The pontoon is strengthened by open lattice girders equal to it in depth, 34 of these being transverse, on either side. It is covered with three-inch teak plank, laid longitudinally, and upon this over every third transverse girder are transverse beams of teak 2 ft. square, for the support of the keel and bilge blocks. Keel blocks are also placed on the intermediate girders. Four large sluices, two on either side, communicate by pipes 18 in. in diameter with the several compartments, the pipes having cocks to regulate the quantity of water in each compartment. There are four pumps on either side, of 2 ft. 9 in. stroke and 26 in. diameter, worked by steam. Four capstans are placed at each end for moving and mooring.—The New York sectional floating dock was patented

by Phineas Burgess in 1838, and the first dock was begun by Burgess and Dodge in 1839. It consists of a number of floating pontoons, which form the dock by being placed side by side. At the end of each pontoon there is a framework of timber which supports machinery for pumping, being sufficiently high to remain out of water when the dock is submerged. This framework projects beyond the end of the pontoon, and its lower part contains what is called a balance tank, an air-tight chamber, which may be raised and lowered by means of a rack and pinion connected with the pumping machinery. These tanks have much the same use as the air chambers in the iron floating dock just described; by raising them the depth of the deck of the pontoons will be increased, and by lowering them the pontoons will be raised, independently of the amount of air or water the latter may contain. Fig. 7 represents the largest of these docks owned by the company. It consists of 10 sections, which when placed close together form a dock 350 ft. long and 110 ft. broad. These sections may be placed at some distance apart so as to increase the length of the dock when required, or if not

FIG. 7.—New York Sectional Dock.

of sufficient buoyancy other sections may be added. The advantage claimed for this dock is, that the buoyancy of each section may be so regulated as to bear with equal pressure against all parts of the ship's bottom, so that if she has been warped there will be no strain. On the other hand, it is stated that irregularities of pressure caused by swells from steamboats or otherwise more or less reduce this advantage. Advantage it certainly has in the facility with which it may be repaired, by taking up any section and placing it upon the dock formed by the remainder.—The arrangements for docking at the navy yard of Philadelphia consist of a floating sectional dry dock, and a permanent stone basin with two marine railways. The sectional dock consists of nine sections, which may be increased in number, each section being 105 ft. long and 32 ft. wide, and the pontoons 11 ft. deep. There are three pumps at each end of each section, moved by two engines of 20 and two of 12 horse power. The bottom of the basin is 350 ft. long and 226 ft. wide, and will hold 10 ft. 9 in. of water at mean high tide. The dry dock at San Francisco is a sectional dock similar to the one at Philadelphia, but is

a little larger. The dock at Portsmouth is a balance dry dock, 350 ft. long, 105 ft. wide, and 38 ft. deep. There is also a basin 350 ft. long and 120 ft. wide, with two marine railways. At Pensacola the docking arrangements are precisely the same as at Portsmouth.—There is in use at New York a so-called hydrostatic screw dock, in which vessels are raised by hydrostatic power applied to screws to which chains are attached, supporting strong platforms consisting of trusses of timber. The first dock of the kind was worked by screws alone, and was patented by Elisha Turner in 1825. The improvements by which hydrostatic power was applied were patented by Zebedee Ring in 1836. The screws which suspend the chains are fixed in a drawing frame which rests upon pins at either side. The drawing frames are propelled by horizontal hydrostatic cylinders. The platform upon which the vessel rests may be adjusted to the bottom by raising or lowering each section or truss as may be required.

DOCTOR (Lat., a teacher), a person who has taken all the degrees of a faculty, and is empowered to teach and practise it. It is bestowed by universities and colleges as an honorary distinction. The doctorate and the degrees which conduct to it were instituted early in the 12th century. The first ceremonious installation of a doctor was at the university of Bologna, when Bulgarnus was promoted to the doctorate of the civil and canon law. The learned Irnerius, one of the revivers of the Roman law at that time, composed the formulary which has been followed since, and which gives great solemnity to the reception of the degree. The usage was immediately adopted by the university of Paris, which in 1145 conferred the degree of doctor upon Peter Lombard and Gilbert de la Porrée. The title and degree of doctor were in use in England under King John, about 1207. In Germany during the middle ages a doctor of law enjoyed the same privileges as knights and prelates. The first doctors were only of law and theology; medicine was afterward added; and in 1340 in the university of Paris the four faculties of law, theology, medicine, and the arts or letters were organized as they are now. At Oxford and Cambridge, and recently also in some of the German and American universities, diplomas of doctor of music have been given. The title of doctor has occasionally been bestowed upon women. In 1787 the university of Göttingen decreed the title of doctor of philosophy to Dorothea Schlözer; in 1817 the university of Giessen gave the title of doctor of medicine to Mariane Charlotte von Siebold; in 1827 the university of Marburg pronounced Johanna Wytenbach doctor of philosophy. Still more recently women have received the title of doctor of medicine from foreign and from American schools. In the universities of Oxford and Cambridge, and in most of the continental universities, a student who is to receive the

degree of doctor has to prepare one or more theses, which in Germany are called the inaugural theses. In the United States the title is conferred upon those of eminent learning or ability in their profession, without demanding from them any learned exercise in return, excepting in the medical profession, where it is bestowed at the end of a course of study. The title had an existence outside of the universities during the middle ages, and was bestowed upon every one of singular learning. Thus Alexander of Hales was called the irrefragable doctor; Thomas Aquinas, the angelic doctor; Bonaventura, the seraphic doctor; Duns Scotus, the subtle doctor; Roger Bacon, the admirable doctor; William Occam, the singular doctor; Denys le Chartreux, the ecstatic doctor; and Alain de Lille, the universal doctor. The title of doctor has been given to some of the fathers of the church whose teachings have the highest authority. At an early period there were accounted four doctors of the Greek church, St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. John Chrysostom; and also of the Latin church, St. Augustine, St. Jerome, St. Gregory the Great, and St. Ambrose. Pope Pius V. assigned the fifth place among the Latin doctors to St. Thomas Aquinas, and Sixtus V. gave the sixth place to St. Bonaventura. St. Bernard was added to the series by Pius VIII. The title of doctor of the law existed among the ancient Jews. Those who figure in the Talmud are called doctors of the Talmud, or distinctively doctors of the Mishnah (*tana'im*) and of the Gemara (*amora'im*), according to the divisions of that book in which they appear. They were also called rabbis.—In England, Germany, and the United States the title doctor of divinity (D. D.) or doctor of sacred theology (S. T. D.) is conferred, generally as an honorary degree, upon distinguished teachers of Christianity. The degrees of doctor of philosophy (Ph. D.) and doctor of civil and canon law (J. U. D., *juris utriusque doctor*) are conferred by German universities for proficiency in studies. In England and the United States, the title of doctor of laws (LL. D.) is conferred as an honorary degree upon those who have acquired distinction in any department of learning or public affairs. In place of this the university of Oxford confers the corresponding degree of doctor of civil law (D. C. L.).

DOCTORS' COMMONS, the college of civilians in London, near St. Paul's churchyard, founded by Dr. Henry Harvey, dean of the arches, for the doctors of the civil law, burned down in the great fire of 1666, rebuilt in 1672 at the cost of the profession, and taken down in 1867. In the common hall were held until 1858 the sessions of the court of arches, the chief ecclesiastical court of the province, the archdeacon's court, the prerogative court for the hearing of testamentary causes, the faculty court, the court of delegates, and the court of admiralty. The most interesting part of

doctors' commons was the prerogative will office, in which were kept all wills admitted to probate in the prerogative court of the archbishop of Canterbury, which had jurisdiction over nearly all such business in the kingdom. The original testaments preserved here dated from 1483, the copies from 1383. Great care was taken to prevent mutilation. No stranger was allowed to make a memorandum from either the wills or the index; extracts or transcripts, when wanted, were written out by the attending copyists, but any person was allowed to examine a will on payment of the regular fee. Attached to the college were 34 proctors, who gave licenses for marriages, and performed the duties of solicitors. Only doctors of the civil law were allowed to practise in the courts held in doctors' commons. By acts of parliament passed Aug. 25 and 28, 1837, and Aug. 2, 1858, the importance of doctors' commons was in great measure destroyed. Jurisdiction in all testamentary, divorce, and matrimonial cases was transferred from the ecclesiastical tribunals to a court of probate, and a court for divorce and matrimonial causes. A central office for the registry of wills was opened, with branches in the chief towns of the kingdom, and judges of ecclesiastical courts were ordered to transmit to it all wills in their possession. Serjeants and barristers at law were admitted to practise in the probate court, but compensation was made to the displaced proctors to the amount of one third of the average profits of their business, payable during their natural lives, and officers of the ecclesiastical courts were transferred to corresponding positions in the new probate court. Marriage licenses were to be granted as before. The same restrictions relative to the examining of wills continued in force in the new registry office, and drew forth a remonstrance from literary men early in 1859. The jurisdiction of the court of delegates is now transferred to the judicial committee of the privy council, but the court of arches, the archdeacon's court, and the faculty court still exist for the hearing of ecclesiastical causes.

DOCTRINAIRES, a French constitutionalist party, which originated after the restoration of the Bourbons, and represented the interests of liberalism and progress, as opposed to the ultra royalists, in the executive government and legislature. Royer-Collard, the duke de Broglie, and Guizot were its foremost leaders. They were called *doctrinaires* because they insisted that the state should be administered in accordance with rational doctrines and demonstrable political utility, rather than with party formulas or the passion of the hour. After the revolution of July, 1830, when they came into power, they assumed a conservative position in antagonism with the republicans and radicals. After February, 1848, the *doctrinaires* were no more heard of.

DOD. I. Daniel, an American machinist, born in Virginia, Sept. 28, 1788, died in New York,

May 9, 1823. His father was distinguished for his versatile mechanical genius. Daniel received a thorough scientific education, and declined an appointment as professor of mathematics in Rutgers college to devote himself to the manufacture of engines for steamboats, then a new invention. He settled at Elizabethtown, N. J., and built for the steamboat Seahorse an engine of different construction from any former one; it proved superior to them all, and was generally adopted. In 1818 he built an engine for the steamship Savannah, which the next year made the first voyage across the Atlantic ever performed by a steamship, and returned in safety after visiting England and Russia. The experiment was peculiarly unprofitable, and was not immediately repeated. He removed in 1821 to New York city, where he was reputed the most successful engine builder in the United States. In 1823, having altered the machinery of a steamboat, he went on board of her to witness in a trial trip on the East river the effect of his changes. The boiler exploded, and so severely injured Mr. Dod that he survived but a few days.

II. Albert Baldwin, D. D., an American scholar, son of the preceding, born in Mendham, N. J., March 24, 1805, died in Princeton, Nov. 20, 1845. He graduated at Princeton college in 1822, and after spending more than three years in private teaching in Fredericksburg, Va., returned to Princeton in 1826 as a student in the theological seminary. From 1827 to 1829 he was a tutor in the college, and in 1830 was elected professor of mathematics, continuing in this post till his death. He lectured upon architecture and political economy, and wrote occasional review articles, especially for the "Biblical Repertory." An article by him in answer to objections urged against capital punishment was adopted by a committee of the New York legislature as their report.

DODD, William, an English clergyman, born at Bourne, Lincolnshire, in May, 1729, executed in London, June 27, 1777. He studied at the university of Cambridge, where he distinguished himself as a writer both of prose and poetry. He left Cambridge for London in 1750, and the next year married a woman who possessed neither virtue nor fortune, and whose tastes were even more extravagant than his own. He was ordained deacon the same year, and priest in 1753, and was appointed to the vicarage of West Ham, near London, where he obtained great success by his impressive eloquence. His reputation so increased that he was quickly called to London as a preacher, retaining his former benefice. He now abandoned himself to extravagance and excesses. In the hope of being able to meet his increasing expenses, he multiplied his labors as editor and author, and in the course of several years published various original pieces, translations, and new editions of esteemed works. He was intrusted in 1763 with the care of the education of Philip Stan-

hope, afterward earl of Chesterfield, and obtained an appointment as one of the chaplains of the king. In 1766 he took the degree of LL. D. at Cambridge. Pursued by his creditors, and ambitious of a still higher position than he had yet obtained, he wrote to the wife of the lord chancellor Apsley an anonymous letter, offering her £3,000 if by her influence he might be promoted to the rectory of St. George's, Hanover square. This letter, being communicated to the chancellor, laid before the king, and traced to the author, caused his name to be stricken from the list of the royal chaplains. He fled to Geneva, where the young Lord Chesterfield was then residing, who gave him money to satisfy his creditors, and presented to him a living in Buckinghamshire. But Dodd went directly with his money to France, where he spent it recklessly. On his return to England in 1776 he resumed his pastoral functions, and preached with fluency and unction. His last sermon was at the Magdalen chapel, Feb. 2, 1777. Two days after this he forged a bond upon Lord Chesterfield for £1,200, for which he was tried at the Old Bailey and condemned to death. Though he refunded the money, and was recommended by the jury to the royal clemency, and though numerous noble protectors, many clergymen, and a petition from the city of London bearing 23,000 signatures, prayed for the interference of the crown, he was executed at Tyburn. Of his many writings, the "Reflections on Death" (1763) and the "Thoughts in Prison," a poem in blank verse, written during the progress of his trial, are alone not forgotten.

DODDRIDGE, a N. W. county of West Virginia, drained by Hughes river; area, about 300 sq. m.; pop. in 1870, 7,076, of whom 35 were colored. The land is mostly hilly and adapted to pasturage. The Parkersburg division of the Baltimore and Ohio railroad crosses it. The chief productions in 1870 were 15,879 bushels of wheat, 113,064 of Indian corn, 18,723 of oats, 14,167 of potatoes, 4,649 tons of hay, and 113,649 lbs. of butter. There were 1,815 horses, 1,987 milch cows, 2,782 other cattle, 7,183 sheep, and 3,904 swine. Capital, West Union.

DODDRIDGE, Philip, an English clergyman, born in London, June 26, 1702, died in Lisbon, Oct. 26, 1751. Left an orphan at the age of 13, he was sent to a private school at St. Albans, where he made the acquaintance of Dr. Samuel Clarke, who became interested in him for his love of learning. The duchess of Bedford offered to defray the expenses of his education at either university, a proposal which he declined on account of the implied condition that he should become a clergyman in the church of England. In 1719 he entered a dissenting academy at Kibworth to study theology. From 1722 to 1729 he fulfilled pastoral duties at Kibworth and the neighboring town of Market Harborough, and in that retired district pursued his studies. In 1729 he took

charge of the academy where he had been himself educated, and removed it first to Market Harborough, and then to Northampton, whither he had been invited as pastor. At this academy the most distinguished dissenting ministers near the middle of the last century were educated. Dr. Doddridge presided over it for 20 years, and acquired a high reputation as a preacher and author. In 1750 his constitution, always feeble, began to show signs of decline, and he sailed to Lisbon, where he died 13 days after his arrival. His most popular and useful works are "The Rise and Progress of Religion in the Soul," and the "Family Expositor," containing a version and paraphrase of the New Testament, with notes. He also published several volumes of sermons, "The Principles of the Christian Religion," a "Treatise on Regeneration," and several minor works. He is the author of numerous hymns included in the standard collections. His "Course of Lectures on the Principal Subjects in Pneumatology, Ethics, and Divinity" was published posthumously (London, 1763), and gives the outlines of a system of metaphysics and divinity. His works were collected in 10 vols. (Leeds, 1802), and his "Private Life and Correspondence," by one of his descendants, appeared in 5 vols. (London, 1831). Accounts of his life were also published by his contemporary Job Orton, and his pupil Dr. Kippis.

DODGE. **I.** A S. central county of Georgia, formed since the census of 1870, bounded S. W. by the Ocmulgee river, and intersected by the Little Ocmulgee; area, about 500 sq. m. The surface is generally level and sandy. Pine forests abound. The Macon and Brunswick railroad traverses it. Capital, Eastman. **II.** A S. E. county of Wisconsin, drained by Rock river and several smaller streams; area, 936 sq. m.; pop. in 1870, 47,035. There are prairies in various parts, interspersed with oak openings, and covered here and there with small clusters of burr and pin oaks. The valleys of the streams are occupied by extensive forests of oak, ash, elm, and maple. The soil is calcareous and highly fertile. Horicon lake is in the N. part. The Wisconsin division of the Chicago and Northwestern railroad and the Northern and La Crosse divisions of the Milwaukee and St. Paul railroad cross it. The chief productions in 1870 were 2,294,538 bushels of wheat, 25,009 of rye, 629,020 of Indian corn, 909,648 of oats, 96,233 of barley, 354,744 of potatoes, 70,258 tons of hay, 1,153,272 lbs. of butter, and 229,984 of wool. There were 13,550 horses, 16,311 milch cows, 14,549 other cattle, 59,138 sheep, and 21,017 swine; 6 manufactories of agricultural implements, 23 of carriages, 10 of barrels and casks, 11 of furniture, 2 of pig iron, 4 of woollen goods, 14 of saddlery and harness, 5 of pumps, 4 saw mills, 12 flour mills, and 6 breweries. Capital, Juneau. **III.** A S. E. county of Minnesota, drained by affluents of the Zumbro river; area, 432 sq. m.; pop. in 1870, 8,598. The surface

is undulating or nearly level prairie, and the soil fertile. The Winona and St. Peter railroad crosses it, and the Milwaukee and St. Paul railroad touches the S. W. corner. The chief productions in 1870 were 634,741 bushels of wheat, 81,277 of Indian corn, 384,528 of oats, 47,150 of barley, 36,569 of potatoes, 19,863 tons of hay, 27,667 lbs. of butter, and 20,808 of wool. There were 2,877 horses, 3,208 milch cows, 4,659 other cattle, 5,889 sheep, and 2,824 swine; 7 flour mills, 1 saw mill, 1 manufactory of furniture, 4 of carriages, 1 of agricultural implements, and 1 brewery. Capital, Mantorville. **IV.** An E. central county of Nebraska, bounded S. by the Platte river, and intersected by the Elkhorn; area, about 600 sq. m.; pop. in 1870, 4,212. The surface is level and the soil fertile. The Union Pacific railroad crosses it. The chief productions in 1870 were 86,181 bushels of wheat, 123,466 of Indian corn, 116,252 of oats, and 13,927 of potatoes. There were 1,382 horses, 1,264 milch cows, 2,025 other cattle, and 2,386 swine. Capital, Tremont.

DODGE, Mary Abigail. See p. 802.

DODDINGTON, George Bubb, Baron Melcombe, an English politician, born in Dorsetshire in 1691, died July 28, 1762. He was educated at Oxford, and in 1715 was chosen to parliament for Winchelsea. His talents soon attracted attention, and after accompanying Sir Paul Methuen to Madrid, he was made envoy extraordinary to Spain, returning in 1717. On the death of his uncle George Doddington in 1720, he came into possession of a large estate in Dorsetshire, took the name of Doddington, and erected at the cost of £140,000 a magnificent residence, where he entertained the leading literary men of the time. In politics he was a whig, and joined himself to Walpole; but when that minister refused him a peerage, he joined the opposition. Resuming his relations with Walpole, he received several valuable appointments; but again joining the opposition, he was conspicuous in the assaults on Walpole's ministry which resulted in its overthrow, and was after some time made treasurer of the navy. Again changing his views, he joined the faction of Frederick, prince of Wales, in 1749, and received from him the promise of a peerage and a cabinet office, to be conferred when the prince should become king. The prince and Doddington settled the former's first ministry; but in the midst of their scheming the prince suddenly died. In 1755 he was once more appointed treasurer of the navy, but soon lost the office. In 1761 he obtained the object of his life, being made Baron Melcombe of Melcombe Regis, through the favor of Lord Bute. This success he did not live long to enjoy, and on his death the title became extinct. His estates fell to Richard Grenville, Earl Temple, and his personal property was bequeathed to Thomas Wyndham, whose relative, Henry P. Wyndham, published Doddington's "Diary" in 1784. This diary was kept, with some breaks, from March 8, 1749, to Feb. 6, 1761, and af-

fords a lively picture of the parties, politics, and public men of the last years of George II.'s reign, of the political corruption of the time, and of that of the author himself. Several of the author's political papers are attached to it. The volume has been frequently reprinted.

DODO (*didus ineptus*, Linn.), a large bird of the island of Mauritius, at present placed in a subfamily of the order *columba*, or pigeons. It has become extinct within two centuries. It was discovered by Vasco da Gama in 1497, and was mentioned by various voyagers, from Jacob van Neck and Wybrand van Warwijk in 1598, to Captain Talbot in 1697. In the work of Strickland and Melville on "The Dodo and its Kindred" (4to, London, 1848) are given many quaint descriptions and figures of the bird, which it appears was not uncommon in the 17th century, and was frequently used as food by the crews of vessels. In 1638 François Cauche says that he saw in Mauritius birds "larger than a swan, covered with a black down, with curled feathers on the rump,

The Dodo (*Didus ineptus*).

and similar ones in place of wings; that the beak was large and curved, the legs scaly, the nest made of herbs heaped together; that they lay but one egg of the size of a halfpenny roll or that of a pelican, and that the young ones had a stone in the gizzard." In the same year a living specimen was exhibited in London, and described by Sir Hhamon Lestrange as a "great fowle, somewhat bigger than the largest turkey cock, and so legged and footed, but stouter and thicker and of a more erect shape, colored before like the breast of a young fesan, and the back of dun or deare color." In 1644 the Dutch began to colonize the island, and these birds were soon exterminated by the colonists, and by the dogs, cats, and rats, which devoured the eggs and the young in the nests; after the French took possession in 1715 the dodo is no longer mentioned as a living bird. This is a most remarkable and clearly proved instance of the extinction of an animal by human agency; and as yet the data for determining the species are less than

those left by many animals which perished ages ago from geological causes. Besides the rude drawings of the early voyagers given in Strickland's work, there are at least six oil paintings which are no doubt faithful copies of the living originals. The first of these paintings, the one copied in all books on natural history, and now in the British museum, is anonymous, but probably by one of the artists who painted the following ones; there are three pictures by Roland Savery, one at the Hague, another in Berlin dated 1626, and the third in Vienna dated 1628; a fifth painting is in the Ashmolean museum, by John Savery, dated 1651; and a sixth in the gallery of the duke of Northumberland, at Sion House, painted by Goeimare, and dated 1627. The principal remains of the dodo are a foot in the British museum, and a head and foot in the Ashmolean museum at Oxford, England, rendered familiar by numerous casts; the latter are all that is left of the specimen in Tradescant's museum, and all that was saved from the flames which consumed the decayed specimens by order of the trustees in 1755; the head preserves the beak and nostrils, the bare skin of the face, and the partially feathered occiput; the eyes are dried within the sockets, but the horny end of the beak is gone. A cranium exists in the museum at Copenhagen; a collection of bones at Paris, much incrustured with stalagmite, carried there in 1830; and others sent by Mr. Telfair to the Andersonian museum at Glasgow and to the London zoölogical society in 1833. The latter included a tibia and the head of a humerus of large size, with a broad articulating surface and a sudden reduction of the size of the shaft. The generic characters are a strong bill, much longer than the head, with the culmen straight at first and then arched to the tip, which is acute and overlaps the lower mandible; the latter has the gonyes short and suddenly curved upward; the nostrils are in the membranous portion (which occupies two thirds of the bill), oblique and exposed; the wings imperfect; the tail apparently a tuft of five feathers, broad and curved upward; the tarsi robust, moderately long, and scaled; the outer toe is shorter than the inner, and the anterior toes are all free at the base; the hind toe is long, on the same plane with the others, and scaled; the claws are short, strong and blunt. Cuvier ranked the dodo with gallinaceous birds; others have traced out its analogies with the ostrich and with the penguin. Most writers, before the work of Strickland, considered it a modified form of raptorial bird. Reinhardt of Copenhagen first referred the dodo to the pigeon family, and Strickland and Melville followed out this idea. They consider it a frugivorous terrestrial pigeon, colossal and brevipennate, coming near in the bill to the genus *treron* (Vieill.; *vinago*, Cuv.). The chief external characters of resemblance are the soft, depressed, and vascular nature of the long basal

portion of the bill; the extent of the bare skin around the eyes and forehead; the hooked and compressed corneous portion of the upper mandible, overhanging the lower; the position of the nostril in the middle of the beak, and near its lower margin; the sudden sinking from the forehead to the beak, and the rapid narrowing in front of the orbits; the short, robust tarsi, and expansion of the lower surface of the toes; the low plane of the hind toe; the relative lengths of the toes as compared with the ground pigeons, the absence of interdigital webs, and the short blunt claws. Among internal characters, gathered from the narratives of voyagers and the paintings of the bird from nature, are the presence of a large crop, a very muscular gizzard, the palatableness of the flesh, and the laying of a single egg. Besides these characters are the absence of the vomer; the form and direction of the bones, processes, and foramina of the skull; the form of the metatarsal and tarso-metatarsal bones, processes, and canals; and especially the passage of these canals on the outside of the posterior tarsal ridge. Mr. Allis detected only 11 sclerotic plates, as in the pigeons, no other birds having so small a number. Its food was probably dates, cocoanuts, mangoes, and such other fruits as would fall from the tropical trees. Strickland calls it "a young duck or gosling enlarged to the dimensions of a swan; . . . a permanent nestling, clothed with down instead of feathers, and with the wings and tail so short and feeble as to be utterly unservient to flight." While Strickland was preparing his work in England, Dr. S. Cabot, jr., of Boston, published a paper in the "Journal of the Boston Society of Natural History" (vol. v., p. 490), entitled "The Dodo a Rasorial and not a Rapacious Bird;" in this he comes to the same conclusions as the first mentioned author, and without any knowledge of his views. He says "that the dodo was a gigantic pigeon, and that, as its general shape, feathering, &c., resemble more strongly the young than the adult pigeon, we may perhaps be allowed to surmise that it properly belongs to an earlier epoch than the present, and has become extinct because its time was run." Prof. Brandt of St. Petersburg, in 1848, maintained the affinity of the dodo to the *charadriade* or plovers, which he styles pigeoned-formed or dove-like waders. The testimony seems overwhelming in favor of the columbine affinities of the dodo.—In the island of Rodriguez lived another large brevipennate bird, the *solitaire*, allied to the pigeons.

DODONA, an ancient city of Epirus, in N. Greece, celebrated as the seat of the most ancient oracle of Greece, which ranked with those of Delphi and Ammonium. It is the only place of great celebrity in Greece of which the situation is not exactly known; no vestige of it can be discovered. Leake conjectures that its site was at the S. end of Lake Janina (anc. Pambotis); others place it near the source

of the Oropus. Before the erection of the temple, which was dedicated to Jupiter, the mysterious sayings of the deity were uttered from the whispering branches of a large oak tree; and the old poets ascribed to the oak grove at Dodona the power of speech. The temple was destroyed by the Ætolians under Dorimachus, 219 B. C., but it was rebuilt, and is mentioned by Pausanias as standing in the 2d century of our era. A town of this name existed as late as the 6th century. According to Lucretius, the fountain near the temple at Dodona was inflammable.

DODSLEY, Robert, an English publisher and author, born at Mansfield, Nottinghamshire, in 1703, died in Durham, Sept. 25, 1764. He was originally a servant, but produced in 1732 a volume of poems, under the title of "The Muse in Livery," and subsequently a dramatic piece called "The Toy Shop," which met with the approbation of Pope, and was acted with great success at Covent Garden theatre in 1735. He then became a bookseller. Patronized by Pope, his shop became in time one of the leading establishments in the British metropolis. In 1737 he brought out a farce styled "The King and the Miller of Mansfield," which was received with applause at Drury Lane; and a few years subsequently a ballad farce entitled "The Blind Beggar of Bethnal Green." In 1746 he projected "The Museum, or the Literary and Historical Register," which numbered among its contributors some of the most eminent literati of the day. In 1748 he started another periodical called "The Preceptor," the preface of which was written by Dr. Johnson, and in 1749 he paid the latter 15 guineas for his "Vanity of Human Wishes." In 1750 he published "The Economy of Human Life," which was ascribed by some to Lord Chesterfield. In 1758 his tragedy of "Cleone" was represented at Covent Garden theatre, on which occasion Dr. Johnson declared that "if Otway had written it, none of his other pieces would have been remembered." It went through four editions in a year. In the same year, in connection with Edmund Burke, he started the "Annual Register," which is still published. He was the first to collect and republish the "Old English Plays" (1st ed. edited by T. Coxeter, 1744; 2d ed. by Isaac Reed, 12 vols. 8vo, 1780), by his selection of which his name is now most frequently recalled. He retired from business in 1763 with a handsome fortune. His collected writings were published under the title of "Miscellanies, or Trifles in Prose and Verse" (2 vols., 1745 and 1777).

DODWELL, Edward, an English author, born about 1767, died in Rome, May 14, 1832. He published "A Classical and Topographical Tour through Greece during the years 1801, 1805, and 1806" (2 vols. 4to, 1819), and made numerous drawings of ruins and scenery in Greece and Italy, some of which were published after his death under the title of "Views

and Descriptions of Cyclopean or Pelasgic Remains in Greece and Italy, with Constructions of a later Period."

DODWELL, Henry, an Irish writer, born in Dublin about 1641, died at Shottesbrook, Berkshire, June 7, 1711. He graduated at Trinity college, Dublin, and settled in London in 1674. He was for about three years Camden professor of history at Oxford, but lost the office in 1691 by refusing to take the oath of allegiance to William and Mary. He is known especially as a writer on classical and religious subjects. Among his works are: *Annales Thucydidei et Xenophontei*; *Annales Velleiani, Quintiliani, Statiani*; *De Veteribus Græcorum, Romanorumque Cycelis, obiterque de Cyclo Judaorum ac Ætate Christi, Dissertationes*; and "An Epistolary Discourse, proving from the Scriptures and the first Fathers that the Soul is a principle naturally mortal, but immortalized actually by the pleasure of God, to punishment or to reward, by its union with the divine baptismal Spirit; wherein it is proved that none have the power of giving this divine immortalizing Spirit since the Apostles, but only the Bishops."—See "Life of Dr. Henry Dodwell," by Francis Brokesby (London 1715).

DOES, Jacobus van der, the elder, a Dutch painter, born in Amsterdam, March 4, 1623, died there, Nov. 17, 1673. After visiting Paris, he spent several years in Rome, where he was assisted by fellow artists. He was celebrated for his pictures of animals, especially sheep and goats, in connection with landscapes. His son SIMON (1653-1717) excelled in the same branch of art; and another son, JACOBUS the younger, born in 1654, showed great talent as a historical painter, and died in Paris at the age of about 38.

DOG, a digitigrade carnivorous mammal, belonging to the genus *canis*, and to the family *canida*, which also include the wolf, fox, and jackal. The species of this family are so nearly alike in structure that the genera *canis*, *lupus*, *vulpes*, &c., have been established on characters which are considered of inferior importance in other families; even the intellectual and instinctive faculties have been employed by F. Cuvier and others in distinguishing the species, the domestic dogs being regarded as derived from several distinct though nearly allied wild canines. Except in the size of the bones, there is nothing in the osteology of this family which can be made characteristic of the wild species or of the domestic races when compared with each other, though as a family group they are quite distinct from other digitigrades. In the skulls, the several species of wolf differ more from each other than do many domestic dogs from the wolves; as a general rule, the cranial cavity bears a greater proportion to the face as the intelligence of the animal is more marked. The teeth of dogs, which are largest in the wild species, consist, in the upper jaw, of six incisors in the intermaxillary bones; two

canines, strong, curved, and separated by an interval from the incisors; and six molars on each side, the first three, in interrupted series, being small, but with cutting edges, and called also false molars; the fourth or carnivorous tooth is bicuspid, with a small tubercle anteriorly on the inner side; the fifth is less cutting, bicuspid, with a large internal tubercle; the sixth and last is small and tubercular. In the lower jaw there are six incisors; two canines, continuous in the series, and seven molars on each side, of which four are false, the fourth being bicuspid; the fifth or carnivorous tooth has its tubercular third lobe entirely posterior; behind this are two tubercular teeth, the last being very small and frequently absent in the adult animal. The incisors are regular, the outer being the largest, and nearly perpendicular in the upper jaw; the lower canines shut in front of the upper; the tubercular character of the other teeth indicates a less carnivorous propensity than in the cat family, and that their natural diet is not exclusively animal, being better suited for carrion and broken bones than for the flesh of a living prey. In some species, as the buansuah and the dhole, the second tubercular tooth is constantly wanting, according to Hamilton Smith. The brain cavity is comparatively small; the crests of the skull and the large temporal fossæ indicate powerful muscles of mastication; the eyes are directed forward; the nostrils are largely opened in a movable glandular muzzle; the tongue is soft, thin at the edges, and capable of considerable extension beyond the teeth, as is seen during rapid breathing in warm weather; the pupil is round, as in other diurnal *canide*. The fore feet have five toes, the hind feet four or five; the two middle toes are the longest and equal; the fifth toe, when present, does not reach the ground; the claws are blunt, strong, not retractile, and formed for digging; the soles are furnished with tubercles, and in some arctic dogs with hair. The hair is soft and woolly near the skin, longer and coarser externally; some of the dogs of India have the skin entirely naked, this condition originating probably from some mangy disease. The tail is generally long, and is curled upward. The number of mammae varies from six to ten; the size, form, and color are different according to the variety. The young open their eyes on the 10th or 12th day; the first teeth begin to be shed at the fourth month, and the growth ceases at about two years of age; gestation is about nine weeks, and the duration of life is about 10 years, though sometimes prolonged to 20. Though strong, they are not courageous in proportion to their strength; hearing is acute, and smell and vision are proverbially delicate, the former in the bloodhound, the latter in the greyhound; taste is so dull or perverted that even luxuriously fed pets will not disdain a meal of decaying flesh. Dogs are not so cleanly in their habits as cats; they drink by lapping, require water often, and turn round

frequently before lying down; their bark is very different from the howl of wild canines, and expresses by its intonation fear, sorrow, anger, joy, and other feelings. All canines seem to have a natural antipathy to the cat family; and all, both wild and domesticated, and the nearly allied hyæna, are subject to hydrophobia.—There are several species of wild dogs in different parts of the earth, all of which may have been pressed into the service of man; the crossings of these with each other, with the wolf in the north, the jackal in the east, the aguara canines in the south, the fennec in Africa, and the fox everywhere, with the care of man to develop special breeds according to his wants, are sufficient to account for all the varieties of our domestic dogs. Dogs differ in stature, in the shape of their ears and tails, and in the number of their caudal vertebrae; some have an additional claw on the hind foot, or an extra false molar tooth on one side; the hair differs in color, texture, and length; and all these differences may remain as permanent varieties, like some human races, as long as the circumstances which gave rise to them continue essentially the same. When restored to the wild state, they approximate more or less closely to their original type, whether it be wolf, fox, jackal, or other wild canine. Hamilton Smith classes dogs according to their apparent affinities with wild canines in corresponding latitudes: the arctic dogs with wolves; the dogs of the south with the jackal in the old world, and with the aguara canines in South America. The Indian dogs may be traced to the prairie wolf and the Mexican coyote, and in Asia to the jungle koola. Whatever may have been their originals, it is altogether probable that the primitive dogs, like the other domestic animals, were very different from any of the present races, and perhaps from any now existing canines.—The first genus of wild dogs is *lyciscus* (Smith), embracing the prairie wolf and coyote of North America, and the koola of India; the head is broad, the muzzle pointed, ears erect, fur short, tail bushy; stature about 26 in.; the disposition is more peaceable than that of the wolf; the voice barking; they are gregarious and live in burrows. It is probable that the aboriginal Indian dog is derived from the first two; the color is ashy gray, with some white on the tail and breast; when hunting in packs, these animals are hardly to be distinguished from domestic dogs. They are named *L. latrans*, *L. cagottis*, and *L. tigris*. The red wild dogs, forming the genus *chrysiscus* (Smith), are found in the warmer parts of Asia, Africa, and the Australian islands; the muzzle is less pointed than in *lyciscus*, and the tail less bushy; they are shy and fierce, seldom burrow, hunt in troops, and bark, and are about 24 in. high; they want the second tubercular tooth in the lower jaw, and are said to have hairy soles; they destroy many of the young of the larger cats; they differ from

wolves and jackals in their habits and instincts, and approximate the domestic dog in the small size of the anal glands. The buansuah of Nepal (*C. primævus*, Hodg.) is of a deep rust color above and yellowish below; it is intermediate in size between a wolf and a jackal, hunting by day or night by the scent chiefly, in small troops; there are several varieties in the wooded mountains of British India. (See BUANSUAH.) The dhole of India (*C. scylax*, Smith) is more slender than the buansuah, higher on the legs, with a sharper muzzle, long close-haired tail, and large dark ears; the color is a light bay. The dhole of Ceylon (*C. Ceylonicus*, Shaw) is an allied, if not the same species. The pariah cur dogs of India are not merely degraded mongrels, but are the offspring of an indigenous wild species living in the jungles and in the lower Himalaya range: this resembles the jackal more than the wolf, but is more bulky in body and lower on the legs; the voice is yelping and howling. Other red wild dogs are found in Sumatra and Java. The Austra-

Dingo.

lian dingo (*C. Australasiae* of authors) is a wild dog which has been partially domesticated by the natives, and is no doubt an indigenous inhabitant, not introduced by man; in its native wilds it howls in a melancholy manner, and it is more than a match for a domestic dog of the same size; it hunts in small packs, sometimes in pairs, and is very active and fierce. It stands about 2 ft. high; the color above is fulvous spotted with white, paler on the sides and throat, and whitish below; it carries the tail horizontally, and runs with the head high and the ears turned forward. The genus *thous*, of which the typical species is the wild dog of Egypt (*C. anthus*, F. Cuv.), resembles the wolf on a small scale, being not more than 18 in. high, of a light structure, with rather short tail, close, ochry fur, barred or pencilled with black and white; the species do not burrow, and are not gregarious, seldom howl, and have no offensive smell; they all have the tip of the tail black, and prefer rocky, sandy districts,

where there are bushes and water. Hamilton Smith is of the opinion that the greyhound of the desert was originally derived from one of the species of this section. It is found from Egypt and Arabia to the Cape of Good Hope. South America when first discovered by the Spaniards had its indigenous canines, all with a tendency to elliptical pupils, though less so than in true foxes; among these are the aguara dogs, genus *ducieyon* (Smith). These are between the wolf and the fox in form, with bulky body and short legs; they burrow and are more social and gentle than the aguara wolf (*C. jubatus*, Desm.). This group seems to represent the *thous* of the old world, though the forehead is more rounded, and the tail consists of an imperfect brush; the prevailing color is fulvous brown, often with a hoary tinge; the face looks like that of the fox; they are not very shy, and are capable of being domesticated; they are great thieves, with a propensity to conceal objects of no use as food; besides the usual articles of diet, they will eat fish, crabs, reptiles, insects, small birds, and even mollusks and berries; they are generally silent and hunt by day or by moonlight; they are good swimmers. Several species are described, ranging from Surinam to the Falkland islands; the domesticated specimens differ but little from the wild originals, except in the tail being less bushy; the average height is 15 in.; there are five toes to each foot, and the gape of the mouth is large and wolf-like; they hunt pacas, agoutis, and wild gallinaceous birds. All these wild dogs cross with the domesticated ones of the country, forming the most complicated intermixtures.—Certain varieties have relapsed into a wild state. In Asia Minor there is a race of these feral dogs (as Hamilton Smith calls them), of nearly the size of the local wolf, and resembling the shepherd's dog except that they have a more bushy tail, sharper nose, and the fur reddish gray, and that they hunt in packs in open day. A smaller breed is found in Russia. In Santo Domingo there is a large feral dog of the race of hounds formerly used by the Spaniards in their western conquests; it is about 28 in. high, with a head like a terrier, and the general color pale bluish ash; its scent is very fine, and it follows its prey with great speed, attacking it with ferocity; flocks sometimes suffer from its depredations; it is believed that it was introduced into Spain from the north, such is its resemblance to the Danish dog. In the pampas of South America are troops of feral dogs, a mixture of all the breeds of the country; their ears are erect as in true wild canines; they are bold and cunning, destroying many of the young of the wild herds of cattle and horses; when redomesticated, they are remarkable for their courage, sagacity, and acute sense of smell.—Of the true domesticated races, the arctic dogs of both hemispheres are large, of wolfish aspect, with pointed nose, erect ears, and long hair of mixed black and white; they are fierce,

bold, and strong; they swim excellently, burrow in the snow, and will drag the native sledges for hours at a time several miles an hour. The arctic voyages have made read-

Esquimaux Dog.

ers familiar with the habits, appearance, and valuable properties of the Esquimaux dog; this species (*C. borealis*, Desm.) is probably the same as the Siberian dog. The Hare Indian dog (*C. lagopus*, Rich.), according to Sir John Richardson, is peculiar to the region of Mackenzie river and Great Bear lake; it is intermediate in size between the wolf and fox, has erect ears, bushy tail, and a general gray color, with white and black markings; the hair is long, and at its base, as in all arctic dogs, is a thick wool; it is about 14 in. high, and is used for hunting and not for draught; it is

Newfoundland Dog.

playful and affectionate, though not very docile. In the Hudson Bay territory, in Canada, and in the Lake Superior mineral district, there is a mongrel race of dogs which take the place

of horses during winter; they are hardy, easily managed, strong, bearing abuse, scanty food, and fatigue without murmur; they are invaluable to the hunter, Indian, half-breed, and traveller in these snow-clad regions; no particular breed is sought for, the only qualities valued being strength and endurance. The Newfoundland dog (*C. Terræ Novæ*, Smith) seems to be indigenous to America; it is longer than the Esquimaux dog, less compact, with a wider muzzle, drooping ears, and long hair disposed to curl; it is a handsome and powerful dog, very intelligent, trusty, and kind; the pure breed is almost semi-palmated, making them the best water dogs; crossed with the hound, they attain an enormous size; the general color is black, with some fulvous about the eyes, nose, throat, and joints, and white about the feet and end of the tail. Anecdotes of the sagacity of this well known breed are innumerable. The Nootka dog (*C. laniger*, Smith) is noted for its thick and matted fur, which the natives mix with wool and make into garments; the describer of this species

Shepherd's Dog.

thinks it indicates that the Esquimaux and Newfoundland races were derived from Asiatic originals, perhaps from the dog of Siberia. At the head of the list of the domestic canines of temperate Europe stands the shepherd's dog (*C. domesticus*, Linn.), still with the wolf-like stature, head, and hair; its appearance is rather unpromising; its shaggy hair is generally varied black and gray, the ears are short and erect, and the tail is bushy and curved; having been trained from time immemorial to the care of flocks, its peculiar faculties seem to be instinctive, and its sagacity, fidelity, and courage are not excelled by any species of dog; the height is not quite 2 ft., but the form is very muscular. This breed is confined to temperate and southern Europe. The true shepherd's dog attends the flocks, keeps them together, and protects them from violence. A variety called the drover's dog, somewhat larger and more rugged, is of great assistance in driving sheep and cattle to market. The great wolf

dog (*C. Pomeranus*? Linn.) has all the sagacity of the shepherd's dog, with a strength which enables him to resist successfully the attack of a wolf; it is large, whitish clouded with brown, with pointed nose, erect ears; and long silky hair; it is most common in southern Europe. The Alpine or St. Bernard dog is universally known; the old race resembled the Newfoundland dog, but the present dogs are short-haired, with very broad feet, and generally of a fawn color; their bark is uncommonly loud and deep. They are trained to carry food, wine, and warm coverings, attached to their bodies and necks; they depart in the morning, after violent snow storms, in search of lost travellers, and are followed by the monks. Many lives have been saved through their instrumentality; but now that the roads are better and more easily followed, and the inhabitants in the upper valleys more numerous, their services are less frequently called for. In the subdivision of the watch dogs of F. Cuvier are found some of the largest canines, and especially the fierce races mentioned by

St. Bernard Dog.

ancient authors; they have short hair and a wide muzzle, but in their skulls they resemble the wolf; the typical color is rufous, which is more or less mixed with black and white; occupying the northern temperate zone, they are probably descended from the lyciscan dogs, mixed toward the south with the mastiff race. They are less docile and sagacious than the former groups, but more watchful and noisy, and have considerable courage, and are therefore generally kept by the humbler classes to protect their farms; from this cause they are greatly crossed, and are doubtless the progenitors of the mongrel races of western Europe; from their moderate powers of smelling they are of little use in hunting. The Suliote dog (*C. Suillus*, Gmel.), sometimes called boar hound in Germany, is one of the largest and fiercest breeds; it is sometimes nearly 4 ft. high at the shoulder. Resembling this is the Danish dog (*C. glaucus*, Smith), but smoother, with shorter ears, and of a slaty blue color. The matin dog (*C. lanarius*, Linn.) has the

head elongated and the forehead flat, the ears pendulous at the tips, the hair rugged, of a yellowish fawn color with blackish rays; the height is about 2 ft.; being bold, strong, and active, it is valuable for a house and sheep dog. The Poe dog (*C. Pacificus*, Smith) seems to be indigenous to the South sea islands, and once was very abundant in the Hawaiian group; the muzzle is pointed, the ears erect, the back long, the limbs crooked, and the hair smooth and tan-colored; its food is vegetable, with a little fish, and it is much esteemed by the natives as an article of diet; the aboriginal race is now lost, from mixture with the imported dogs of Europe. The dogs of Patagonia are as large as fox hounds, and wolf-like in appearance; those of Tierra del Fuego are smaller, resembling a cross between the fox, shepherd's dog, and terrier. Their dogs are of great value to the natives of these regions. In France and several other countries, especially Holland, dogs are frequently employed as draught animals, and in Kamtchatka and Greenland almost exclusively for the same purpose.—Cuvier has asserted that the dog was perhaps necessary for the establishment of human society; though this may not be apparent in the most highly civilized communities, a moment's reflection will convince us that barbarous nations owe much of their elevation above the brute to the possession of the dog. That man has been able to make such extensive use of this animal must depend on innate qualities in the races, as, for instance, keenness of scent and the desire to chase, in the hound; the impulse to seek objects, in the spaniel and pointer; the tendency to watch and guard in the shepherd's dog and mastiff. The activity of their brain is shown by their proneness to dream. It is said that the ancients were fond of the flesh of dogs; it is well known that the Polynesians, Chinese, and American Indians consider it a great delicacy; when fed principally on vegetable food, it is palatable and nutritious.—The monuments of Egypt show that dogs, like men, were as distinct in their races thousands of years ago as now; and it becomes interesting to inquire if there are fossil dogs. Fossil canines have certainly been found, but these have been referred without examination as a matter of course to wolves, foxes, and jackals, and not to dogs; they are chiefly met with in the pliocene caves, in the drift, and in the alluvium. The fact has been already mentioned that it is very difficult to distinguish the different species of *canidæ* by their skeletons, except by the size of the bones. The domestic dogs have the last tubercular tooth wider than that of the wolf, and the teeth of many of the cave dogs differ from those of the domestic races only in being larger. Dr. Lund discovered fossil dogs larger than any now living in the caves of Brazil, associated with an extinct monkey; a similar association has been found in a stratum of marl, under compact limestone, in the Pyrenees. Dr. Schmerling has described several

fossils of the true dog, evidently belonging to two distinct varieties, differing in size from those of the wolf and fox found in the same locality. Cuvier says of the bones of a fossil *canis* from the cave of Gailenreuth, that they resemble those of the dog more than the wolf, yet he does not positively declare them to belong to the former. Marcel de Serres has described two species of dogs found in a marine tertiary limestone, one resembling the pointer, the other much smaller. The frontal elevation in the skull of the dog is greater than that of the wolf, and the skull of a small canine with this character strongly marked, from a bone cave in England, was pronounced by Mr. Clift that of a small bulldog or a large pug. Distinct traces of at least four types of dogs have been found in a fossil state, the Canary dog, the pointer, the hound, and the bulldog, with a smaller one classed by Schmerling with the turnspit; and as many of these are known to be hybrids, the list must probably be further enlarged. The certain antiquity of these bones, whether they have been referred to the proper race of dogs or not, is sufficient to destroy the claims of the wolf, jackal, or fox to the exclusive paternity of the domestic dogs. As there are undoubted wild canines which are true dogs, there is no improbability that some of these fossil remains may have belonged to such prior to their subjugation and domestication by man; and there is no more necessity of referring the fossil canines to a single species than the domesticated ones. The size of the fossil dogs is no greater than that of some living races mentioned in the text.—Those desirous of pursuing the subject of dogs more fully are referred to the writings of Buffon, Frédéric Cuvier, and Col. Hamilton Smith. See also BEAGLE, BLOODHOUND, BULLDOG, GREYHOUND, HOUND, MASTIFF, POINTER, SPANIEL, and TERRIER.

DOG DAYS (Lat. *dies caniculares*), among the ancients, the period of greatest heat in summer, so named because in the latitudes of the Mediterranean this period nearly corresponded with that in which the dog star rose at the same time with the sun. To this conjunction all antiquity, and all the later followers of judicial astrology, ascribed a malignant influence. The heliacal rising of the dog star is a very indefinite phenomenon; its precise dates cannot be determined, and owing to the precession of the equinoxes it does not now occur till about Aug. 10, when the greatest heat of the season is often over. So uncertain is the time that the ancients indiscriminately ascribe the evil influence to Sirius and Procyon (the largest stars respectively of Canis Major and Minor), though there is several days' difference in their heliacal risings. The modern almanac makers sometimes reckon the dog days from July 24 to Aug. 24, and sometimes from July 3 to Aug. 11.

DOGE (Lat. *dux*, a leader), the title of the elective chief magistrate in the republics of

Venice and Genoa. The dignity or office was called *dogato*. The doges of Venice were elected for life. The first of them was called to the dignity in the year 697, when Venice had scarcely risen to the importance of a city, and he and his successors ruled it as sovereigns, with nearly absolute power. But when the state grew mightier both on land and sea, through commerce and conquests, its nobles continually strove to check the power and influence of their elective head, and the government became more and more oligarchical, its form more and more republican, the dogate a magistracy, and finally a mere title. A change in the constitution toward the end of the 12th century put the whole legislative power into the hands of the council of 470; this elected the executive council of 6 and the 60 *pregadi*, and the doge was elected by 12 electors, chosen by 24 members of the great council. The first chief magistrate thus elected was Sebastiano Ziani (1173), who, in order to make his dignity, now stripped of every power, at least popular, distributed money among the people at his installation; an act adopted by his successors as one of the ceremonies of inauguration. Another ceremony introduced by the same doge was that of marrying the sea by a ring thrown into the waves of the Adriatic, which emblem of power over the mighty element was bestowed upon him with many other marks of dignity by Pope Alexander III., whom he supported in his long and bloody struggle against the emperor of Germany, Frederick Barbarossa. A new council of 40, established in 1179, and vested with supreme judicial power, also served to circumscribe the prerogatives of the doge. It was in vain that many a chief magistrate covered his office and the state with glory; in vain that Enrico Dandolo, the nearly blind nonogenarian, led the victorious fleet of the fourth crusade to Constantinople (1202-'4), that he was, at both attacks, among the first to storm it, that he refused the conquered imperial crown; the nobility were incessantly bent on the humiliation of the so-called chief of the state, which was completed in the second half of the 13th century, and at the beginning of the next, by the new and last election law, the most complicated instrument of indirect exercise of sovereignty that has ever been framed, by the introduction under Gradenigo of the hereditary nobility and its golden book, and the establishment of the terrible council of ten, supreme in power, irresponsible, and judges of the doge himself. Stripped of nearly all his prerogatives, the power of the doge was confined to the command of the army and the opportunity of profiting by the frequent strifes and contentions of the different councils and classes; and the office became so burdensome that a law had to be enacted (1339) prohibiting any one from laying it down, and that in 1367 Contarini had to be forced to accept it. The doge received ambassadors, but could give them no answer of his own, and their letters he

opened in the presence of the senate; money was struck in his name, but without his stamp or arms. He was not allowed to leave the city, to announce his accession to any but princes of Italy, to accept presents, to possess estates in foreign countries, or to marry his daughters to foreigners. His children and relatives were excluded from every important office. He was surrounded by spies, fined for every transgression, and his conduct scrutinized after his death by a tribunal of three inquisitors and five correctors. The office was destroyed with the state in 1797, by the French, under Bonaparte.—In Genoa, the first doge was elected for life in 1339, after the victory of the popular party over that of the nobility, and voluntarily shared his power with a council of state consisting of twelve members, six from the nobility and six from the people. But during the long internal and external contentions of this republic, the dogate was often modified, and sometimes even abolished. Andrea Doria, the great admiral, and the deliverer of the republic from the yoke of the French in 1528, reorganized it, and his constitution remained, but slightly altered, till the French conquest (1797). According to it, the doge, who must be a noble, and 50 years of age, was elected for two years; he presided in the two legislative councils, of 300 and of 100; had the right of proposing and vetoing laws; exercised the executive power with 12 secret councillors; and resided in the palace of the republic. The ceremonies and restrictions connected with his election and dignity were similar to those in Venice. Napoleon, having founded the republic of Liguria, restored this ancient dignity (1802), and abolished both when elected emperor of the French (1804).

DOG FISH, a cartilaginous plagiostome, of the family *squalidæ* or sharks, and the genus *acanthias* (Risso), of the class selachians of Agassiz. This genus is characterized by two dorsal fins with a strong spine before each; the first dorsal is behind the line of pectorals, the second between the ventral and caudal spaces; no anal fin; temporal orifices large; skin rough in one direction, the scales heart-shaped with a central spine directed backward; teeth in several rows, sharp and cutting, with the points directed backward and outward. The common dog fish (*A. Americanus*, Storer) has the upper part of the body of a slate color, deepest on the head and lightest on the sides, and white below; just under the anterior portion of the lateral line is a row of circular white spots, and a few similar ones are irregularly distributed on the back; the young are still more spotted; the length does not exceed 5 ft. The species is found from Davis strait to New Jersey. Dog fish in spring and autumn appear in large numbers in Massachusetts bay, and the residents of some towns on Cape Cod give up all other business at these times to fish for them; they are valuable for the oil from the livers, for the food of swine, and for the

polishing property of their skin. The weight varies from 8 to 25 lbs. They remain in shallow water three or four days, at which time they are easily caught with the hook; they

Dog Fish (*Acanthias Americanus*.)

feed on garbage, and may be called the scavengers of the sea. The young are brought forth alive, and are often seen swimming about with the yolk bag attached. In the British provinces they are dried, and in the winter given to pigs, which thrive well upon them; the refuse parts are used for manure. The dog fish (*acanthias*) of Europe is a different species; its flesh is eaten in Scotland. Along the east coast of England it is called the bone dog; it troubles the fishermen by cutting off their hooks; according to Mr. Couch, it bends itself into a bow for the purpose of using its spines, and then by a sudden motion causes them to spring asunder in opposite directions. Three species of *scylium* (Cuv.), of a reddish brown color with numerous spots, are called dog fish in Europe.—There is another shark (*mustelus canis*, Mitch.), also viviparous, called dog fish. In this genus the teeth are blunt, forming a close pavement in each jaw; the first dorsal is in advance of the ventrals; there are no spines; the body is cylindrical and elongated, of a uniform slate color on the back and sides, and dusky white below; the head is flat between the eyes. This shark grows to a length of 5 ft., and is very common in Long Island sound, where it is taken in nets spread for other fish; from the form of the teeth it is probable that the food consists principally of crustacea and mollusks; it is not common on the coast of Massachusetts, but is abundant on the shores of New Jersey, where it is very troublesome to the fishermen by stealing their baits and driving away other more edible species; its flesh, though occasionally eaten, is coarse, rank, and unpalatable. In Europe the species of this genus are often called hound fish; the *M. levis* (Cuv.) is called the smooth hound from the softness of the skin, and ray-mouthed dog fish from the peculiar conformation of the teeth.—The dog fish of the great lakes of North America is a soft-rayed bony fish, generally placed in the herring family, and the genus *amia* (Linn.).

DOG GRASS. See COUCH GRASS.

DOG STAR, or *Sirius*, the brightest star in the heavens, belonging to the constellation Canis Major. Sir J. Herschel estimates its light as

exceeding more than twofold that of Canopus, the second star in brilliancy, and more than fourfold that of Alpha Centauri, the third, whose light the same astronomer takes as the standard for first magnitude stars. But the variable Eta Argus, shining now as a sixth magnitude star, nearly equalled Sirius in lustre 30 years ago. Sirius was known to the ancients as a red star, Ptolemy describing it as *ὑποκίρρος*, reddish yellow, and Seneca speaking of it as ruddier even than Mars. Its light at present is perfectly white. Examined with the spectroscope by Rutherford and Huggins, it shows a spectrum crossed by a multitude of fine lines, and by four very strong lines. The four lines are identified with the hydrogen lines. Their strength and breadth seem to imply that the star is surrounded by an extensive atmosphere of hydrogen, existing close to the photosphere, at a very great pressure. From a measurement of the position of the F line of hydrogen, which appears slightly displaced toward the red end of the spectrum, Huggins has inferred that the star is receding from us at the rate of about 29 miles a second, or, taking into account the sun's own motion, at the rate of 26 miles a second in space. Late-ly, however, he has seen reason to believe that this estimate of the velocity is too high. The annual parallax of Sirius has been estimated at 0.150" by Henderson and Maclear, and at 0.250" by Cleveland Abbé. If we assume 0.2" as the value, the distance of the star exceeds about a million times the distance of the sun. From the observed apparent motion of the star upon the celestial sphere, it follows, assuming this estimate, that it is travelling athwart the direction of the line of sight at the rate of about 15 miles a second. Combining this motion with Huggins's estimate of the motion of recession, it follows that it is actually moving through space at the rate of 33 miles a second. Certain peculiarities of the proper motion of Sirius have led astronomers to the belief that the star has a companion, not equally bright, but large enough to give Sirius an appreciable motion of circulation around their common centre of gravity.

DOGWOOD (*cornus*, Linn.), small deciduous trees or shrubs of the order *cornacea*, natives of Europe, Asia, and North America, of which there are several species. *C. alternifolia* (Linn.), the alternate-leaved dogwood, is indigenous to North America, and is found in shady woods or by river banks in every latitude. It frequently attains a height of 15 to 20 ft. The leaves are alternate, ovate, and acute; flowers white, May to July; fruit dark blue, ripening in October. Of all the species of *cornus*, the flowering dogwood (*C. florida*, Linn.) is the most beautiful, and in its native soil under favorable circumstances attains a height of 30 to 35 ft. The specific name *florida* was bestowed because of the profusion of its flowers. Specific characters: branches shining; leaves ovate, acuminate, pale beneath; flowers

umbellate, protruded after the leaves; leaves of involucre large, roundish, retuse, white and very showy; drupes ovate and bright red. It is found as far northward as New Hamp-

Alternate-leaved Dogwood (*Cornus alternifolia*).

shire, but particularly abounds in New Jersey, Pennsylvania, Maryland, and Virginia, where the soil is moist; in Florida and the Carolinas it is found only in swamps; in Ohio, Kentucky, and Tennessee, it is not found in the forests except where the soil is gravelly. It was first described in Ray's *Historia Plantarum* (1686-1704), and afterward by Catesby in his "Natural History of Carolina." The wood is hard, fine-grained, and susceptible of a high polish. It

Flowering Dogwood (*Cornus florida*).

enters into the construction of many articles of ornament and utility, such as the handles of mallets, toys, harrow teeth, hames for horse collars, and the shoeing of sleds. The inner

bark is very bitter, and has medicinal properties similar to Peruvian bark; the surgeons of the confederate army found it their best dependence in the absence of quinia. It is said to contain a principle, cornine, similar to quinia; the cornine used by the eclectics is a resinoid precipitate resulting from treating a strong tincture with water; it contains much tannic acid. The bark may be used instead of galls in the manufacture of ink; the Indians obtained a scarlet dye from the bark of the roots. The flowering dogwood is frequently cultivated as an ornamental tree, its large flowers, which rival the whiteness of snow, affording a pleasing contrast with the deep green of the surrounding foliage.—The name dogwood is improperly given in some parts of the United States to the *rhus venenata*, a species of poisonous sumach.

DOL, a town of France, in the department of Ille-et-Vilaine, 13 m. S. E. of St. Malo; pop. in 1866, 4,230. It contains a fine cathedral, and possesses considerable historical interest. During the middle ages it was frequently besieged, and passed into many different hands. In 1793 it was garrisoned by the Vendéans, and successfully resisted an attack of the republican troops. The old fortifications of the town are still standing.

DOLABELLA, **Publius Cornelius**, a Roman general, born about 70 B. C., died in 43. He was noted for his profligacy, and is said to have committed several capital crimes in his youth which but for Cicero would have cost him his life. About 50 he put away his wife Fabia, and, notwithstanding his debauched character and the opposition of Cicero, married Tullia, the daughter of the latter. In the next year the urgent demands of his creditors compelled him to leave Rome, and he sought refuge in the camp of Cæsar, to the great sorrow of Cicero. After the battle of Pharsalia, in which he took part, he returned to Rome and became a tribune. His acts led to bloody struggles between the two parties, which did not cease until Cæsar's arrival in the autumn. Cæsar did not think it prudent to punish him, but to get him out of the city took him with him to Africa and in his campaign against the sons of Pompey in Spain. He promised Dolabella the consulship in 44, but Antony opposed him. The senate was to decide on the opposition on March 15, when Cæsar's assassination changed everything. Dolabella at once seized the consular fasces, approved of the murder, caused Cæsar's altar to be thrown down, and crucified or threw from the Tarpeian rock many who were anxious to pay Cæsar divine honors. His conduct pleased the republican party, and he was awarded the province of Syria. On his way thither he committed such atrocious crimes that he was outlawed by the senate and declared a public enemy. Cassius marched against him, and Dolabella, to avoid falling into his hands, was killed by one of his own soldiers by his own orders.

DOLCI, or **Dolce**, **Carlo**, or **Carlino**, an Italian painter, born in Florence, May 25, 1616, died there, Jan. 17, 1686. His father, grandfather, and uncle were all painters, and he was placed at the age of nine with Jacopo Vignali. Under Vignali's tuition Carlo's genius developed with such remarkable rapidity that after a few years he attempted successfully a full-length figure of St. John. He next produced a figure of his mother, and the delicacy and tenderness which marked these early productions attracted much attention, and procured for him employment at home and abroad. He devoted himself almost exclusively to sacred subjects. His works are deficient in imaginative genius, but they are all distinguished by agreeable coloring, a remarkable relief produced by his skilful management of chiaroscuro, a singular delicacy of composition, and a finish in which he approached almost the consummate patience and industry of the great Dutch masters. The sameness of expression in most of his pictures facilitates copies and imitations, which abound all over Europe. He excelled most in small pictures, and the themes in which he was most successful are borrowed from the New Testament. Among his best works are the "St. Anthony" in the Florentine gallery, the "St. Sebastian" in the palazzo Corsini, the "Four Evangelists" in the palazzo Ricardi at Florence, "Christ Breaking the Bread" in the marquis of Exeter's collection at Burleigh, and "Herodias with the Head of John the Baptist" and "St. Cecilia, or the Organ Player," at Dresden. Another of his chief productions, "Christ on the Mount of Olives," belongs to the collections of the Louvre in Paris.—**AGNESE**, one of his daughters, who married a merchant named Carlo Baci, was one of his best pupils, and the most successful copyist of his works.

DÔLE (anc. *Dola*), a town of France, department of the Jura, 28 m. S. E. of Dijon; pop. in 1866, 11,093. It is situated on the slope and at the foot of a hill on the right bank of the river Doubs, near the canal that joins the Rhône and the Rhine. The railway from Dijon to Besançon, which passes the town, gives it some importance as a place of transit between Paris and Switzerland. It has a college, a public library of 40,000 volumes, two hospitals, and the ruins of a castle built in the 12th century. The principal building is the cathedral of Notre Dame. There are manufactures of hosiery, pottery, and chemicals, iron-smelting furnaces, flour mills, tile works, tanneries, and quarries. Dôle is of great antiquity, having been a considerable town under the Romans, and is situated on the old road leading from Lyons to the Rhine. Some remains of this work, as well as of an ancient aqueduct and theatre, are still to be seen. It was for a time the capital of Franche-Comté and the seat of a parliament. After having been taken once or twice previously, it was captured and dismantled by the French in 1674. During the Franco-German war it was for a time the

headquarters of Garibaldi. It was occupied by the Germans Nov. 14, 1870, and again Jan. 21, 1871.

DOLET, Étienne, a French scholar and printer, born in Orleans in 1509, burned as a heretic in Paris, Aug. 3, 1546. He was fond of classical studies, and one of the especial admirers of Cicero, and warmly defended this predilection against the sarcasms of Erasmus. He was rash and impetuous, which made him many enemies, who lost no opportunity of persecuting him. Having been often accused of cherishing heretical sentiments, he was at last adjudged an atheist by an ecclesiastical court at Paris, in consequence of an expression which he used in his translation of the *Axiochus* of Plato, which was not to be found in the original; and for this he was condemned.

DOLGORUKI, a princely family of Russia. **GRIGORI** in 1608-'10 gallantly defended a monastery near Moscow against the Polish forces under Sapieha. In 1624 **MARIA** married Czar Michael, founder of that branch of the house of Romanoff which still retains the throne of Russia; but she died four months later. **YAKOV**, born in 1639, was liberally educated, and entered the civil service in 1676, and was sent as ambassador to the western powers in 1687. He entered the army in 1695, and distinguished himself in the campaign against the Turks, especially at the siege of Azov. In the war with Sweden he was captured (1700) and kept a prisoner at Stockholm for ten years. After his release Peter made him a senator and confided to him the most important affairs of state. He died in St. Petersburg in 1720. **YURI** (George), a general under Alexis and Feodor, was killed in the revolt of the Strelitzes (1682), while fighting for the claim of Peter to the throne. **MIKHAIL**, his son, who had been a minister of Feodor, perished with his father. **IVAN** was the friend of Peter II., to whom his sister Catharine was betrothed; but the czar died before the day set for the marriage (1730), and Ivan made a vain attempt to have him name Catharine as his successor. He then aided in raising Anna to the throne; but through the influence of her favorite, Biron, he and all his family were exiled. Afterward recalled from exile, he was accused of conspiracy, and executed at Novgorod (1739). Other members of the family were exiled. **VASILII**, born in 1667, entered the army at an early age, and in 1715 had risen to the rank of major general. Peter the Great sent him on a special mission to Poland, and he was afterward minister to France, to Germany, and to Holland. In 1718, for suspected complicity with the czarevitch Alexis, he was banished; but Catharine recalled him in 1726, and made him general-in-chief, and commander of the army in the war against Persia. In 1728 Peter II. appointed him field marshal, and the next year he became president of the council of war. In 1739 he was imprisoned on some trivial pretext; but when Elizabeth came

to the throne, two years later, she released him and restored his marshalship. He died in 1746. **VASILII**, nephew of the preceding, commander-in-chief of the army of Catharine II., conquered the Crimea in a short campaign in 1771, and received from the empress the surname of Krimskoï. **VLADIMIR** resided for 25 years as minister of Catharine II. at the court of Frederick the Great, whose friendship he gained. **MIKHAIL**, born in 1766, was aide-de-camp to Alexander, and served in the campaigns against France and in Moldavia in 1805-'6, and in Finland as lieutenant general in 1808, where he fell in battle. **IVAN**, born in 1764, spent most of his life in the public service, but cultivated letters, and was a frequent contributor to current literature. He wrote many patriotic poems, and is especially noted for his epistles and satires. He died at Moscow in December, 1823. **VASILII** was minister of war from 1849 to 1856, and was then for some time minister to France. He died in 1868. **PETER**, born in Moscow about 1817, wrote several works, among which are: *Recueil de généalogies russes* (St. Petersburg, 1840-'41); *Notice sur les principales familles de la Russie* (Brussels, 1843), an English translation of which appeared in London in 1858; *Dictionnaire de la noblesse russe* (St. Petersburg, 1854-'7); *La vérité sur la Russie* (Paris, 1860), for which the Russian government banished him and confiscated his estates; and *La France sous le régime Bonapartiste* (Paris and London, 1864). He died in Bern in August, 1868. His *Mémoires* were published after his death in Basel, in two volumes (1869-'71).

DOLLAR, the monetary unit in the United States and several other countries, both of coined money and money of account. All values in the United States are expressed in dollars and cents, or hundredths. The term mill, for the $\frac{1}{1000}$ of a dollar, is rarely employed. The dollar unit, as a money of account, was established by act of congress of April 2, 1792, and the same act provides for the coinage of a silver dollar "of the value of a Spanish milled dollar as the same is now current," and of half and quarter dollars in proportion. The silver dollar was first coined in 1794, weighing 416 grains, of which 371 $\frac{1}{4}$ grains were pure silver, the fineness being 892.4 thousandths. The act of Jan. 18, 1837, reduces the standard weight to 412 $\frac{1}{2}$ grains, but increases the fineness to 900 thousandths, the quantity of pure silver remaining 371 $\frac{1}{4}$ grains as before, and the half and quarter dollars suffering proportional changes. By the act of Feb. 21, 1853, the half dollar was reduced in weight to 192 grains, and the quarter dollar in proportion, and these coins became a legal tender only for sums not exceeding \$5, while the dollar suffered no change in weight, and remained a legal tender for all sums. The act of March 3, 1849, directs a coinage of gold dollars. They were issued the same year, weighing 25 $\frac{8}{10}$ grains, $\frac{1}{10}$ fine, 23 $\frac{8}{10}$ grains be-

ing pure gold. By the act of Feb. 21, 1853, the three-dollar piece of gold was authorized, $\frac{9}{10}$ fine and weighing 77.4 grains. The act of Feb. 12, 1873, known as the "coinage act of 1873," makes the gold dollar the unit of value, but effects no change in the weight or fineness of that coin or of the three-dollar piece, which continues to be a legal tender for all sums. By this act, however, a "trade dollar," weighing 420 grains, designed for the convenience of commerce with China and Japan, was substituted for the old silver dollar, while the weight of the half dollar was fixed at 12 grams, or 192.9 grains, half the weight of the five-franc piece of France and other European countries, the quarter dollar being proportional. The fineness of these coins is unchanged, but the silver dollar is no longer a legal tender for sums exceeding \$5. The number of coins of each kind produced at the mint and its branches, from their organization to June 30, 1872, is as follows:

Three-dollar pieces.....	390,971
One-dollar pieces (gold).....	19,015,642
One-dollar pieces (silver).....	8,045,838
Half-dollar pieces.....	199,430,871
Quarter-dollar pieces.....	87,536,274

Whole number of pieces..... 314,619,596

The value of the coinage is \$149,933,897.—The term dollar is of German origin. During the years 1517–26 the counts Schlick, under a right of mintage conferred by the emperor Sigismund in 1437 upon their house, caused to be struck a series of silver coins of 1 oz. weight, and worth about 113 cents of our money. These pieces were coined at Joachimsthal (Joachim's dale), a mining town of Bohemia, and came to be known in circulation as *Joachimsthaler*, and then for shortness *Thaler*; and this name for coins and money of account has been widely used in the German states ever since. Some German scholars, however, derive the term *Thaler* from *talent*, which in the middle ages designated a pound of gold. In Norway and Sweden we find the *daler*, and in Spain the *dalera*, the Spanish dollar which for centuries figured so conspicuously in the commerce of the world. It was the Spanish pillar dollar (called also the milled dollar from its milled edge) that was taken as the basis of the United States coinage and money of account. By the act of April 2, 1792, 371½ grains of pure silver and 24½ grains of pure gold were declared to be equivalent one to the other, and to the dollar of account. At that time, as now in Great Britain, 113 grains of pure gold were the equivalent of the pound sterling. The value of £1 in federal money, therefore, was \$4 56.5. Prior to this date, and during the confederation, the dollar of account, as compared with sterling currency, had been rated at 4s. 6d., which was an exaggerated valuation of the Spanish dollar; and in accordance with this valuation the congress of the confederation had established \$4 44.4 as the custom house value of the pound sterling. The effect of the

act of 1792 was really to reduce the value of our dollar of account, but apparently to increase the value of the pound sterling about 2½ per cent. By the act of June 28, 1834, the weight of fine gold to the dollar was reduced from 24.75 to 23.20 grains; and on Jan. 18, 1837, it was fixed at 23.22 grains. Comparing this latter weight with the pound sterling of 113 grains, we find an apparent increase in the value of £1 to \$4 86.6, an advance of exactly 9½ per cent. upon the old valuation of \$4 44.4. We have here the explanation of the practice of quoting sterling exchange at 9½ per cent. premium when it is really at par. A much more intelligible method would be to state in dollars and cents the ruling rate per pound sterling for bills on London; *e. g.*: \$4 84, \$4 87, \$4 90, &c.—Spanish dollars were chiefly coined in the Spanish American colonies. The best known variety was the pillar dollar, so called from the two pillars on its reverse, representing the "Pillars of Hercules," the ancient name of the opposite promontories at the straits of Gibraltar. The rude imitation of these pillars in writing, connecting them by a scroll, is said to have been the origin of the dollar mark (\$). Another explanation is that, as the dollar consisted of 8 *reals* (8 R. being stamped upon it), the mark was designed to stand for the "piece of eight," as the dollar was commonly called, the two vertical lines being employed to distinguish it from the figure 8. The Spanish American dollars ceased to be coined when the colonies became independent, and since 1822 their place in commerce has been supplied by the dollars of Mexico, Bolivia, and Peru. (See COINS.)

DOLLART BAY, or **The Dollart**, an arm of the German ocean, about 10 m. in length from N. to S., and 7 m. in breadth. It lies between the Prussian province of Hanover and the Netherlands, at the mouth of the river Ems. It is supposed to have been formed by an inundation in 1277, and another in 1287, which destroyed 3 towns and nearly 40 villages, with thousands of human beings and cattle. The sea has since receded in some measure, and several thousand acres of land have been recovered.

DOLLIER DE CASSON, *François*, a French priest and explorer, born about 1620, died in Montreal, Canada, Sept. 25, 1701. He entered the army and became a captain in Turenne's cavalry. His courage was equal to his strength, which is said to have been so great that he could hold at arm's length a man seated on each hand. Having entered the congregation of St. Sulpice, he went to Canada about 1655. In 1670 he explored Lake Erie and drew up the first map of its whole basin. He was for many years superior of the Sulpicians at Montreal, and wrote a history of that settlement, which was published by the Montreal historical society in 1869.

DÖLLINGER. **I. Ignaz**, a German physiologist, born in Bamberg, May 24, 1770, died in Munich, Jan. 14, 1841. He studied medicine in the

universities of Würzburg, Vienna, and Pavia, and in 1794 was appointed professor of medicine at Bamberg; but the university having been dissolved, he became professor at Würzburg, and in 1823 at Landshut, removing with that university in 1826 to Munich, where he remained until his death. His position in the history of science is mainly due to his researches in comparative anatomy and physiology. His principal works are: *Naturlehre des menschlichen Organismus* (1805), *Grundzüge der Physiologie* (1835), *Entwicklungsgeschichte des Gehirns* (1814), and *Grundzüge der Entwicklung des Zell-, Knochen- und Blutsystems* (1842). He invented an improvement of the microscope. II. **Johann Joseph Ignaz**, a German theologian, son of the preceding, born in Bamberg, Feb. 28, 1799. He was ordained priest in 1822, and became chaplain of Marktscheinfeld in the diocese of Bamberg. His literary productions obtained for him at the age of 24 a chair of church history and polity at the lyceum of Aschaffenburg. Three years later he was appointed professor at the university of Munich. He became one of the most influential men in the ecclesiastical affairs of Bavaria, and was soon identified with the policy of Abel's ministry. His literary labors during this period were chiefly directed to the claims of Protestantism, and he accumulated in his works everything unfavorable to it. He wrote *Kirchengeschichte von der Zeit der Reformation bis zur neuern Zeit*, in continuation of Hortig's *Handbuch der christlichen Kirchengeschichte*, of which he prepared a new edition (Ratisbon, 1833), and commenced a *Handbuch der Kirchengeschichte* on a very extensive plan, but completed only two volumes. His *Lehrbuch der Kirchengeschichte* (1836-'8) is also incomplete, as it leaps over the whole internal history of the middle ages, and is brought to a close at the time of the reformation. He undertook a third work, *Christenthum und Kirche zur Zeit ihrer Grundlegung*, for which he wrote a prolegomena entitled *Heidenthum und Judenthum* (1857), and of which the first volume appeared in 1860. In these works he sharply criticised every opposition to papal authority and received creeds; but he was equally sharp in his moral criticisms of the popes. With the fall of Abel's ministry in 1847 he lost his professorship, but he still remained provost of the collegiate church of St. Cajetan in Munich. In the following year he was elected to the parliament at Frankfort, where he represented in all respects the interests of the Catholic hierarchy. He was reinstated in his chair in 1849, but failed to regain his former influence in government circles. His observation of the movements of the ultramontanists weakened his confidence in his party, and in 1861 he gave a series of popular lectures on the prospects of the continuance of the secular power of the pope, which were appended to his *Kirche und Kirchen, Papstthum und Kirchenstaat* (Munich, 1861). This work roused the

suspensions of the ultramontanists; it gives a synopsis and critique of the Protestant beliefs and sects, in a spirit of great moderation, and declares that Luther was the greatest man of his time. Döllinger called for a congress of learned men to discuss the subject of science and faith, the incompatibility of which had been declared in a recent work of Frohschammer. The meeting was held in September, 1863, and at its close he sent a telegram to the pope, saying, "On the question of the relation of science to ecclesiastical authority, the meeting has decided that the former should be subject to the latter." His *Papstfabeln des Mittelalters* (1863) awakened new suspicions; but in 1864 he joined several professors of theology in Munich in a public declaration of their firm orthodoxy, and of their opposition to Frohschammer and his tendency. But the Jesuits were not satisfied, and continued their attacks upon him in the *Civiltà Cattolica*. The result was that he became more estranged from the episcopacy, and sought his friends among the members of the ministry, who readily lent him their aid in thwarting some of the plans of his enemies. After the papal syllabus of 1864, the Jesuits began to discuss the necessity of having the infallibility of the pope formally announced as a doctrine of the church. Döllinger opposed this proposition, and published in the Augsburg *Allgemeine Zeitung* a series of anonymous articles, which appeared in a separate form under the title of *Papst und Concil*, by Janus (1869). This work was translated into English, French, and Italian, and passed rapidly through several editions; but Döllinger has only indirectly acknowledged himself the author of it. Its object is to show by means of authenticated documents that the papal power was based on fictions and frauds and on great ignorance of historical facts; but it does not relinquish the doctrines of the primacy of the pope and of the infallibility of the church. Döllinger was appointed in 1868 councillor of state for life, and as such he voted against the liberal bill for education. When the doctrine of infallibility was adopted by the council of the Vatican, July, 1870, Döllinger was asked by the archbishop to explain his previous attitude, and to announce his willingness to submit to the decision of the council. He refused to do so, and offered to state his reasons and prove their validity before an ecclesiastical assembly. The organs of the liberal party praised his action, and nearly all the Catholic professors at the university of Munich signed an address of congratulation and sympathy. From the opposition thus excited sprang up the so-called "Old Catholic" movement in Bavaria, that designation (which had been assumed about ten years before by an organization in Baden) being adopted by 12,000 signers of a petition to the king against the teaching of the doctrine. Döllinger received also congratulatory addresses from several cities in Germany and Austria, and his

name became as eminent among anti-Catholics as it had been among ultramontanists. The archbishop announced that all Catholics who continued to attend Döllinger's lectures were rendering themselves liable to excommunication, and issued a pastoral letter to the signers of the address, in which he vindicated the position of the church, and stigmatized Döllinger and his adherents as rebels and schismatics. The Catholic clergymen of Munich published at the same time a declaration of their implicit faith in the new doctrine. Other clergymen in different parts of the country made declarations to the same effect, and Döllinger found himself deserted by a large majority of the several generations of theologians who had been his pupils, while the archbishop issued against him the great excommunication. Döllinger discontinued his clerical functions, although as provost of St. Cajetan, and as superior court chaplain, the court churches were at his command. With 30 of his partisans he published a declaration, reiterating their intention of adhering to the old doctrines of the church, and of rejecting every new doctrine, but declaring also that the doctrine of infallibility was based on forgeries, that it was making the pope a counterpart of the sultan of Turkey, that it was perilous to the church and society, and that the assertions to the contrary by some bishops were of no value, because others, like Archbishop Manning of Westminster, were already extending the application of the doctrine to political matters. In July, 1870, Döllinger was elected *rector magnificus* of the university of Munich, and confirmed as such by the king. In February, 1872, he called a conference at Munich for the purpose of discussing a possible reunion of all the different Christian churches. After considerable debate they adjourned till Sept. 20, when a large Old Catholic congress met at Cologne. Döllinger's principal works not before mentioned are: *Die Lehre von der Eucharistie in den ersten drei Jahrhunderten* (Mentz, 1826); *Mohammed's Religion* (Ratisbon, 1838); *Die Reformation, ihre innere Entwicklung und ihre Wirkungen im Umfange des lutherischen Bekenntnisses* (3 vols., 1846-'8); and *Hippolytus und Kallistus* (1853). Several of his works have been translated into English; that on Paganism and Judaism by N. Darnell ("The Gentile and the Jew, an Introduction to the History of Christianity," London, 1862), and that on "The Church and the Churches" by W. B. McCabe (London, 1862).

DOLLOND. I. John, an English optician, born in London, June 10, 1706, died there, Nov. 30, 1761. He was descended from a French refugee family, and was originally a silk weaver, but spent his evenings in studying various sciences and languages, and made a translation of the Greek Testament into Latin. His preference was for optics, and he went into partnership with his son as an optical instrument manufacturer at Spitalfields. He commenced

a series of experiments on the dispersion of light and other subjects connected with the improvement of telescopes and microscopes, the results of which were communicated to the royal society in a series of papers, which appeared in its "Transactions" during 1753, 1754, and 1758. For these he received the Copley medal, and in 1761 was elected a member of the society, and appointed optician to the king. He was the discoverer of the laws of the dispersion of light, and the inventor of the achromatic telescope. **II. Peter**, son of the preceding, born about 1730, died in 1820. Soon after entering into partnership with his father he removed his business from Spitalfields to St. Paul's churchyard, where he met with great success. He made several important improvements in optical instruments, and contributed some valuable papers to the "Transactions" of the royal society, one of which was a vindication of his father's claim to the discovery of the true theory of the refrangibility of light, which appeared in 1789.

DOLMEN. See CROMLECH.

DOLOMIEU, Déodat Gui Sylvain Tancrède de Gratet de, a French geologist, born at Dolomieu, Dauphiny, June 24, 1750, died at Châteauneuf, department of Saône-et-Loire, Nov. 26, 1801. When 18 years old he killed in a duel a knight of Malta, of which order he was himself a member. He was condemned to death, but the sentence was commuted to imprisonment for nine months, and in his dungeon he devoted himself to the natural sciences. On recovering his liberty he obtained a commission in the army, but did not relinquish his scientific investigations, of which the first fruits appeared in 1775 in his *Recherches sur la pesanteur des corps à différentes distances du centre de la terre*. Made a corresponding member of the academy of sciences, he abandoned the military profession and devoted the rest of his life to science. For a series of years he was engaged in exploring Portugal, Spain, Italy, and afterward Egypt, whither he went with Bonaparte's expedition. While on his return to Marseilles in 1799 he was seized by the Neapolitans, and through the enmity of the order of Malta detained in prison at Messina, where, amid extraordinary hardships, he wrote his *Traité de philosophie minéralogique*, and his *Mémoire sur l'espèce minérale*. He recovered his liberty March 15, 1801, with impaired health, and died soon afterward, while on a visit to his sister. The results of his researches are embodied in his contributions to the *Journal de Physique*, *Journal de l'Institut*, *Journal des Mines*, &c. More than 50 distinct memoirs, many of which contain valuable additions to the knowledge of geology and mineralogy, can thus be traced to his pen, besides his contributions to the *Dictionnaire minéralogique* and the *Nouvelle Encyclopédie*. His most interesting essays are: *Mémoires sur le tremblement de la terre de la Calabre*; *Voyage aux îles de Lipari*; *Mémoires sur les îles*

Ponces, et Catalogue raisonné des produits de l'Etna; and on the nature of leucite, anthracite, pyroxene, &c. The *Journal du dernier voyage du citoyen Dolomieu dans les Alpes* was published by Bruun-Neergaard at Paris in 1802.

DOLOMITE, a mineral species named in honor of the French geologist Dolomieu. It occurs crystallized in rhombohedral forms, and also as a rock of granular and crystalline structure. The mineral species includes several varieties, as brown spar, pearl spar, &c. Its hardness is 3·5-4; specific gravity, 2·85-2·92. The weight of a cubic foot of the rock is consequently about 180 lbs. Dolomite is a magnesian carbonate of lime, consisting of one equivalent of carbonate of magnesia and one of carbonate of lime, or, in 100 parts, 45·65 of the former and 54·35 of the latter. It is usually white, but is also found of various colors. It is largely developed as a metamorphic rock in the calciferous epoch of the Potsdam period of the Silurian age, and is found abundantly along the eastern part of the middle states, its range extending through the gold region of the southern states, northward, passing near Washington, Baltimore, and Philadelphia, thence crossing northern New Jersey, and to the south of the highlands across the Hudson, through western Massachusetts and Vermont into Canada. It also occurs at many localities to the eastward of this metamorphic range. It is very extensively developed in the Tyrolese mountains, Austria, and in various parts of Europe. A beautiful white dolomitic marble used by the ancient sculptors is found in the island of Tenedos, near the west coast of Asia Minor. A brown dolomite, the magnesian limestone of Tennant, occurs in the north of England in beds of considerable thickness, resting on the Newcastle coal formation. In the Isle of Man it is found in a limestone resting on graywacke, and it occurs in trap rock in Fifeshire. Columnar dolomite is found in metamorphic rocks in the Niagara group, in the upper Silurian formation in western New York, and in serpentine in Russia.—For agricultural purposes magnesian lime is not as highly valued as pure lime. It enters less largely into the composition of most cultivated plants, and is thought to render the soil less friable. For making mortar there is a difference of opinion, the European masons rejecting it, while it is popular in the United States. As a building stone, dolomite ranks among the best, as it is easily worked and very durable. It is obtained in large blocks of sound and uniform texture, with good grain for splitting, and unmixed with foreign matters. But different layers in the same quarry vary greatly in quality. The softness of the stone admits of its being easily sawn into ashlar and carved into ornamental mouldings. In England, dolomite has proved so durable and excellent, that a variety of it found at Bolsover moor was selected for the new houses of parliament. The choir of Southwell church, which was built of this variety of stone in the 12th century, was

found by the commissioners to be in so perfect a state that "the mouldings and carved enrichments were as sharp as when first executed." After describing other examples illustrating the durability of this rock, the commissioners say: "As far as our observations extend, in proportion as the stone employed in magnesian limestone buildings is crystalline, so does it appear to have resisted the decomposing effects of the atmosphere; a conclusion in accordance with the opinion of Professor Daniell, who has stated that, from the results of experiments, he is of opinion that 'the nearer the magnesian limestones approach to equivalent proportions of carbonate of lime and carbonate of magnesia, the more crystalline and better they are in every respect.'" The following analyses of some of the best of the American dolomites show how nearly they correspond in composition to the requisite of Professor Daniell:

DOLPHIN (*delphinus*, Cuv.), a carnivorous cetacean mammal, found in most of the seas of the world. The dolphins, as generally restricted, have a convex forehead, and a beak or snout armed with teeth, separated from the forehead by a well marked furrow; they do not acquire the dimensions of the whales, being rarely more than 9 ft. long. The body is fusiform in shape, without evident neck, and terminated by the horizontal tail common to all cetaceans; the head is not disproportionately large, and both jaws are toothed; there are two pectoral fins, and toward the middle of the back is a fold of the skin which may be called a dorsal fin; the eyes are small, with bare lids; the external opening of the ear is small; the tongue is thick, soft, and but slightly movable; the skin is naked and soft, covered only by a thick mucosity. The teeth are simple, conical, and numerous, varying in number even in individuals of the same species. The cranium is very small compared with the face, concave, and much elevated in front and arched behind; the snout is narrow and elongated from the prolongation of the maxillaries and intermaxillaries, which are not curved forward above; the upper jaw is a little shorter than the lower; the maxillaries extensively overlap the frontals; the tubercles which represent the nasal bones are above the intermaxillaries, resting on the frontals; the parietals are below the maxillaries, and quite on the side; the symphysis of the lower jaw is extensive, and the bone is light and hollow. The cervical vertebrae, seven in number, are very thin, and united; the dorsals are 13, with as many pairs of ribs, their articular processes becoming effaced by age, commencing posteriorly, and the trans-

verse being about as long as the spinous processes; the lumbar vertebræ are 18, with very long transverse and spinous processes; a sacral vertebra can hardly be said to exist, as the pelvis consists of a rudimentary bone on each side suspended in the muscles; the caudal vertebræ are about 28, gradually decreasing in size, the transverse processes disappearing about the 16th, and the spinous about the 20th; exclusive of the cervicals, there are about 60 vertebræ in all; the V-shaped bones on the under surface of the bodies begin about the sixth caudal. The breast bone is composed of three bones, the first very wide, grooved in front, and usually pierced with a hole; the shoulder blade is fan-shaped, slightly concave; the clavicle is absent; the pectoral fin is composed of a very short humerus, with a large upper tuberosity, its lower extremity compressed antero-posteriorly, and uniting by a cartilaginous articulation on an irregular line with the bones of the forearm; the latter are almost rectangular, short and flat, the radius in front and the widest; the bones of the wrist, six or seven in number in two rows, form a flat pavement-like surface united by cartilage to the radius and ulna; there is a mere vestige of thumb, according to Cuvier, the index finger being the longest and having nine articulations with its metacarpal bone and phalanges, the third with seven, the fourth with four, and the fifth a mere tubercle. This anatomical description will answer generally for dolphins and porpoises, and the allied genera. Dolphins are among the swiftest of cetaceans, and their speed is owing to the strokes of the powerful tail; the pectoral fins serve merely to balance and guide the body, and to carry the young. The eye and ear are of the mammalian type; the nasal passages seem destined only for the expulsion of water from the mouth and for the introduction of air into the lungs, and are generally considered as not endowed with an average sense of smell; the taste must be very imperfect, and the sensibility of the naked skin low. The teeth are formed only for seizing and retaining prey, which is swallowed whole. Authors differ as to the stomach, some making it single, but most dividing it into three, four, or five compartments more or less complicated; the intestine is simple, 10 or 11 times as long as the body, and gradually diminishing from the stomach to the anus. The dolphin is not a fish, but an air-breathing mammal, warm-blooded, viviparous, and suckling its young. Though shaped like fishes, inhabiting the water exclusively; and moving in the same manner with them, it must come to the surface by means of its horizontal tail, and take in air through the single spiracle on the top of the head, which it can do when the mouth is full of water by means of the upward prolongation of the larynx into the nasal passages, and the shutting off of its cavity by muscular action from the mouth and œsophagus; the external opening of the spiracle is guarded

by a valve, which prevents the entrance of water when the animal plunges beneath the surface. The water taken into the mouth with the food can be made to pass out in a jet from the spiracle, by the closing of the pharynx, and the forcing of the liquid into the nose through the passage in which the larynx is elevated during respiration. Under the skin, in front of the nostrils, are two large cavities covered with muscles; into these the water is sent, and remains until the animal chooses to eject it; then closing a valve at their entrance, the water is sent forth by the contraction of the muscles. The dolphin family make a feeble moaning or plaintive noise, which has often been noticed when they have been stranded alive. The circulation is carried on as in other mammals; only, in order to enable them better to remain under water, there is a plexiform arrangement of the arteries within the chest and near the spine, which serve as reservoirs of pure blood during immersion; these do not communicate directly with veins, and their contents can be taken into the circulation as circumstances require. The reproductive organs are the same as in other mammals, and their functions are similarly performed; the testes are within the abdomen; the prostate gland is large, but the seminal vesicles are absent; the mammae are two, with the nipples concealed in a fold of skin, except during lactation, when they protrude on each side of the genital opening. The kidneys are made up of many small glands united. The brain is very wide, the hemispheres however covering only a portion of the cerebellum; the convolutions are numerous and complicated, but narrow; the olfactory lobes seem to be wanting; the cerebellum is well developed, with distinct median and lateral lobes. This great cerebral development affords some ground for the ancient belief in the superior intelligence of the dolphin. The history of this animal, sacred to Apollo, though encumbered with fabulous and superstitious accounts, doubtless contains much truth which whale-hunting moderns have not cared to examine.—As the dolphin family till recently included all ordinary cetaceans with small heads, the divisions which have since been made are very numerous, and no system of classification as yet offered can be called natural. Such only, therefore, as would not come more properly under other popular titles will be briefly alluded to. At the head of the list is the common dolphin (*D. delphis*, Linn.); this, from the shape of the beak, is vulgarly called the "goose of the sea;" it was the *hieros ichthys* (sacred fish) of the ancients, the favorite of Apollo (whose most famous oracle bore its name), and the supposed benefactor of man; it is seen on very ancient coins and medals, and formed a conspicuous object on the coat of arms of the princes of France; from it was named the province of Dauphiny, which gave the title to the heir apparent to the French throne. It attains a length of

from 6 to 10 ft., and its proportions are admirably adapted for the speed which is its characteristic. It is dark on the back, grayish on the sides, and satiny white underneath. The

Common Dolphin (*Delphinus delphis*).

geographical range of this species embraces the seas of Europe, the Mediterranean, and the northern and temperate Atlantic; other species are found in the seas of America, Asia, and Africa. Vessels frequently meet them in large numbers, shooting under the bows, springing out of the water, and racing with their fellows; their speed is such that they easily outstrip the swiftest steamer. The dorsal fin is about 9 in. high, a little behind the middle of the back; the pectorals, about 2 ft. from the snout, are somewhat longer than the dorsal, narrow and rounded; the tail is crescent-shaped, with a notch in the middle, and about a foot wide; the jaws have from 32 to 47 teeth on each side, according to age, simple, conical, largest in the middle of the series. During rapid motion the tail is bent under the body, and then suddenly brought into a straight line. The dolphin lives principally upon fish, which it pursues even into the midst of the fishermen's nets. F. Cuvier thinks an examination of the habits of the dolphin will disclose a foundation in fact for the supposed intelligence of this

Bottle-nosed Dolphin (*Delphinus tursio*).

species. In former times the flesh of the dolphin was as much esteemed for food as it is now neglected; in the 16th century its price was so high that it was only seen on the tables of the rich; in the time of Dr. Caius, founder

of the college of that name at Cambridge, a dolphin was thought a worthy present for the duke of Norfolk, who in turn distributed it to his friends. In France the dolphin could be eaten during Lent without sin, all cetaceans being then considered fish. The meat is dark-colored, palatable and nutritious, and is now often eaten by seafaring men on long voyages. The *D. tursio* (Fabr.), the *nesarnak* of the Greenlanders, has a thick body, a flattened, short beak, obtuse teeth, a dorsal fin, and a blackish color, except a small part of the abdomen, which is whitish; it attains a size of 9 to 15 ft., has from 88 to 100 teeth, and inhabits the Atlantic from the shores of Europe to those of Greenland; it is less active than the common dolphin. Another name for it is the bottle-nosed dolphin or whale. Other dolphins are the lead-colored (*D. plumbeus*, Dussumier), about 8 ft. long, of a leaden-gray color, rather sluggish in its movements, with about 136 teeth, found on the coast of Malabar, near the shore, where it pursues the pilchards; the bridled (*D. frenatus*, Duss.), less than 6 ft.

White Dolphin (*Beluga borealis*).

long, having on the ash color of the cheeks a black band extending from the angle of the mouth below the eye, found in the neighborhood of Cape Verd; the eye-browed (*D. superciliosus*, Lesson), about 4 ft. long, brilliant blackish blue above, silvery below, with a white streak over the eye, found in the neighborhood of Cape Horn; the *funen* of the Chilians (*D. lunatus*, Less.), about 3 ft. long, with a slender beak, fawn-colored above, white below, with a dark brown cross on the back, in front of the dorsal fin, numerous in Concepcion bay.—Among the *delphinidae* which would not be better described elsewhere is the genus *delphinapterus* of Lacépède, having no dorsal fin, and a slender transversely flattened beak, separated from the cranium by a deep furrow. Péron's dolphin (*D. Peronii*, Cuv.) is about 6 ft. long, elegant in form and proportions, of a deep bluish black above, with the snout, sides, pectorals, abdomen, and part of the tail silvery white; the teeth are about 39 on each side of each jaw; like the rest of the genus, it is found in high southern latitudes. The allied genus *beluga*

(Bon.) has an obtuse, conical, and rounded head, without prominent beak, and without dorsal fin. The whitefish, or white whale (*B. borealis*, Less.), is a beautiful cream-white dolphin, symmetrical, and very swift; the length varies from 12 to 20 ft.; the teeth, according to Cuvier, are $\frac{2}{3}$ - $\frac{3}{4}$; being well covered with fat, it is sometimes chased by coast whalers, especially about the mouths of rivers, where it feeds upon the cod, haddock, flounder, and other fish; it is essentially arctic, though it descends to the temperate regions of both hemispheres; it has been seen in the river St. Lawrence as high up as Quebec. The genus *globicephalus* (Less.) includes the *D. globiceps* (Cuv.), commonly called the deductor, social, bottle-head, blackfish, or howling whale; it resembles the *beluga* in the shape of the head, but differs from it in having a dorsal fin; the length is from 16 to 24 ft., and the general color a shining jet-black; the teeth are from 20 to 28 in each jaw; its favorite resort is the northern temperate ocean in both hemispheres; it is included by De Kay in the fauna of New York; it herds in great numbers, apparently following a leader, and is easily driven

Deductor (*Globicephalus melas*).

upon beaches; the proper name is *globicephalus melas* (Less.). Some species of the genus have been found in the Mediterranean. The long-beaked dolphins (*delphinorhynchus*, Lacép.) have a prolonged snout, thin and narrow, not separated from the cranium by a furrow; the straight jaws are furnished with numerous sharp teeth, and the dorsal fin is single; some of the species attain the length of 36 ft. The best known, *D. micropterus*, Cuv., or *D. Sowerbyi*, Desm., is remarkable for the snout being four times the length of the cranium, and for the curvature upward and forward of the posterior part of the intermaxillaries, carrying with them the maxillaries, frontals, and occipital; it is a northern species, and has been found stranded on the French and English coasts. There are two remarkable genera of fresh-water dolphins, one of which, the dolphin of the Ganges (*platanista Gangetica*, Gray.), will be described under Soosoo, the Bengalee name. The other is the Bolivian dolphin (*inia Boliviensis*, D'Orb.), found in the tributaries of the Amazon and the neighboring

streams and lakes, even to the foot of the Andes; the beak is long, but cylindrical, bristled round with strong hairs, and obtuse at the end; the teeth are about 134, resembling incisors in

Bolivian Dolphin (*Inia Boliviensis*).

front and molars behind; the body is short and slender, the pectorals large, the dorsal small and behind the middle of the back; the skin is fine and smooth; the average length of the adult is about 7 ft.; the color varies from pale blue to blackish above, and is rosy beneath. It comes frequently to the surface, and is comparatively slow in its movements; its food consists almost entirely of fish, which are devoured with the snout above water; it is killed by the natives for its oil. This curious animal seems to form an intermediate type between the carnivorous and the herbivorous or sirenoid cetaceans.—The *delphinidae* are of little value to the whaler, as they are difficult to catch, and their covering of fat is much less than in the whales. Near the mouths of rivers and on the coasts herds of them are occasionally hunted with profit for their oil and their skins, and in high northern regions even for food. Many genera of *delphinidae* inhabited the seas during the tertiary epoch, some very like the present dolphins, others very different from them. Their fossil remains are found abundantly in the miocene, pliocene, and diluvial strata of America and Europe.—The name of dolphin was long ago given by Dutch navigators to a scomberoid fish of the genus *coryphæna* (Linn.), inhabiting the Mediterranean and the seas of warm and temperate regions. The genus has no detached finlets, no isolated dorsal spines, and no armature on the tail; the body is moderately long, more or less compressed, and covered with small scales; there is a single dorsal fin, with flexible rays, extending from the head to near the caudal; the ventrals are thoracic. The generic name is derived from *κορυφή*, summit, in reference to the elevated shape given to the forehead by a bony crest of the interparietal and frontal which rises between the intermaxillaries and extends to the occiput; this gives a trenchant aspect to the head, with a very convex facial profile; the eyes consequently seem low. The mouth is large, having card-like teeth on the jaws and palatal bones. The dolphin of the Mediterranean, so famous for the beauty of its colors when dying, is the *C. hippurus* (Linn.). Many writers have followed the Dutch error as to the name of this

fish, and that of dolphin is taken away by sailors from the cetacean and given to the scomberoid. This species grows to the length of about 5 ft.; the colors are bluish green above, with azure and golden reflections, and citron yellow below, with pale blue tints; the pectorals are partly leaden and partly yellow, the ventrals yellow below and black above, the anal yellow, and the iris golden. In the Atlantic is the *C. equisetis* (Linn.), with a shorter body and more elevated head. On the coast of South America is the *C. dorade* (Val.), from the name given to the genus by the Portuguese. About a dozen other species are described in different parts of the globe. They are exceedingly active, strong, and voracious, pursuing the flying fish, forcing them to leave the water, and seizing them as they descend into it again. Nothing can be more beautiful in a calm sunny day, in the clear water of mid-ocean, than to see these brilliant creatures darting around the vessel, displaying their ever-varying tints of golden, blue, and green,

Coryphæa dorade.

with every movement. They gather around any floating object, and are readily caught by a hook or harpoon; when brought upon deck the beautiful play of rapidly changing colors commences, produced, as in the chameleon and the cuttle fish, by changes in the surface by muscular action, as may be seen by the constant undulation of the long dorsal fin. The flesh is considered good food; it is white, and rather dry. Sailors have an idea, which is probably true, that it is sometimes unwholesome and even poisonous, and they are in the habit of boiling a piece of silver money with the fish to detect the fact; if the piece be tarnished by the boiling, the fish is rejected; if it remain bright, it is fit for the table.

DOMAIN, or **Demesne** (medieval Lat. *dominium*, the dominion of the lord), in England, lands retained by the great landed proprietors for their own use; the *terræ dominicales* or demesne lands being occupied by the lord or *dominus manorii*, while the other or tenemental lands are distributed among the tenants. The demesne lands of the king, *terræ dominicales regis*, which were at an early period very large, and to which additions were made by

forfeitures and otherwise, had been, at the time when Blackstone wrote, almost entirely alienated; but as a portion of them were not conveyed absolutely in fee, but upon long leases, they will revert to the crown upon the expiration of those leases. The principal importance of the royal demesne lands grows out of certain incidents that at an early period attached to the estate of the tenants of those lands. The tenure by which such estates were held is designated by old writers as ancient demesne; and to some extent it still continues to exist. Strictly, lands so held were copyhold, and as such were excepted by the statute 12 Charles II., c. 24, by which military tenures were abolished. One incident, showing that the tenure was originally a species of villenage, is that the lands do not pass by the common conveyances, but by surrender to the lord in the manner of copyhold estates, for certain uses mentioned in the surrender, and a new grant by the lord in pursuance thereof to the *cestuy que use*.—The public domain of the United States is almost beyond calculation. The original thirteen states embraced an area of 341,756 square miles. The whole territory conceded to the United States by the definitive treaty of peace of 1783 was 830,000 square miles. The concessions made by the states to the general government of lands claimed by them outside their respective limits constituted the nucleus of our public domain, which was afterward increased by the purchase of Louisiana from France and Florida from Spain, the annexation of Texas, the acquisitions from Mexico, and the purchase of Alaska from Russia, to a grand total of 2,912,784.74 square miles, or 1,864,382,223 acres, which has first or last belonged to and been subject to sale or other disposition by the government of the United States. For its sale the general system, which now for a long time has prevailed, is to cause it to be surveyed into townships six miles square, embracing 36 equal sections, and these subdivided into quarters, eighths, and sixteenths, and the lots sold at a uniform price of \$1 25 an acre. Full payment is in general required before giving title or possession; but preëmption privileges to the extent of 160 acres are allowed to settlers, who on complying with the formalities prescribed by law may enter and make improvements. A homestead not exceeding 160 acres is given to actual settlers who enter under proper claim and actually occupy for five years. In addition to these liberal provisions for settlers, large quantities of land have been given as bounties for military services, and numerous donations made for various public purposes. The lands designated in the public surveys as swamp or overflowed lands, but a considerable portion of which are only nominally such, have been generally given to the states within which they lie; every sixteenth section in a township has been set apart for the support of common schools; large endowments in lands have been made

for agricultural colleges and other institutions of learning, and still larger to the states or to private corporations for the construction of canals, railroads, and other public works. The general purpose of these grants is to facilitate settlement and advance the general prosperity, rather than to make the lands a source of revenue. Rapid as has been the disposal of public lands, 1,307,115,448 acres still remained unsurveyed and 1,387,732,209 84 unsold and unappropriated in 1870, according to the estimate of the United States land office; but this is subject to large deductions when the grants for railroad lines are earned and located.—The term domain is applied variously in other countries; but in general it embraces, 1, the high-ways, harbors, fortifications, &c. (as to which see EMINENT DOMAIN); 2, the government palaces and other public buildings, gardens, forests, parks, crown jewels, &c.; 3, forfeited estates and other property which the government may dispose of for revenue; 4, the private estate of the monarch, which he may dispose of by will or otherwise, but which if not so disposed of will pass to his successor.

DOMAT, or **Daumat Jean**, a French jurist, born in Clermont-Ferrand, Nov. 30, 1625, died in Paris in 1695 or 1696. For 30 years he was king's advocate at Clermont. His great work is *Les lois civiles dans leur ordre naturel* (5 vols., 1689-'97; English translation by W. Strahan, 2 vols. fol., London, 1737; edited by L. S. Cushing, 2 vols. 8vo, Boston, 1850). Domat is called by Victor Cousin "incomparably the greatest jurisconsult of the 17th century," and by Boileau "the restorer of reason to jurisprudence." The intimate friend of Pascal, and his associate in many of his experiments in natural philosophy, he was distinguished for his taste for mathematics and philosophy as well as for legal attainments.

DOMBROWSKI, **Jan Henryk**, a Polish general, born at Pierszowice, Aug. 29, 1755, died at Winagora, June 16, 1818. He entered the army under Prince Albert of Saxony in 1770, where he rose to the superior grades and became aide-de-camp to Gen. Bellegarde. The diet of Warsaw having voted for the organization of an army of 100,000 men, and recalled all the Poles then in foreign service, Dombrowski joined the Polish forces commanded by Poniatowski in the campaign against the Russians in 1792, served with distinction in 1793, and took part in the insurrection of 1794 under Kosciuszko, but surrendered after the fall of Warsaw. Having rejected offers from both Russia and Prussia, he accepted a commission from the French directory in 1796 to enroll a Polish legion at Milan, and after serving in the Italian campaigns under Bonaparte, Gouvion Saint-Cyr, and Masséna, entered the service of the Cisalpine republic in 1802. In 1806 he joined Napoleon at Berlin, published a proclamation calling upon the Poles to rise, and soon entered Warsaw at the head of two national divisions. He was wounded in the

battle of Friedland, to the favorable issue of which he greatly contributed; in 1809 he fought with Poniatowski against the Austrians; in the Russian campaign of 1812 he commanded a division of the grand army; in 1813 his Poles fought bravely in Germany, particularly at Leipsic; and on the creation of the kingdom of Poland by the czar Alexander he was raised to the rank of general of cavalry and senator palatine. He soon after retired to his estates at Winagora, in the grand duchy of Posen, where he occupied himself with arranging his historical memoirs. He bequeathed his manuscripts, together with his library and collection of antiquities, to the society of the friends of science at Warsaw.

DOME (Gr. *δῶμα*, *δῶμα*, building; Lat. *domus*, a house; mediæval Lat. *doma*, a cupola), a concave covering to a building or part of a building. The Italians apply the term *il duomo* to the principal church of a city, and the Germans call every cathedral church *Dom*; and it is supposed that the word in its present English sense has crept into use from the circumstance of such buildings being frequently surmounted by a cupola. Some writers on architecture restrict the term dome to the convex surface of the roof, and cupola to its concave part. The dome may be a segment of a sphere, spheroid, ellipse, polygon, or any similar figure, but in all cases every horizontal section should have a common vertical axis; it is called surmounted when it rises higher than the radius of its base, subursed or diminished when its height is less than the radius of its base. The thickness should increase toward the base, where the structure is weakest, and where the spreading force of the superincumbent weight tends to burst the dome outwardly. To counteract this pressure, iron hoops or chains are often employed. When built of stone the dome is stronger than the arch, as the tendency of its parts to fall inward is resisted not only by the parts above and below it, but also by those on each side. The constituent pieces are formed somewhat like the frustum of a pyramid, so that when placed in their positions their four angles may point toward the axis of the dome. Each course is thus self-supporting, and not only may the whole be constructed without centering, but an aperture, called the eye, is frequently left in the top without damage to the security of the structure.—The dome seems to have been invented by the Romans or Etruscans, and in the time of Augustus was a common feature in Roman architecture. There is no proof that the Greeks or Egyptians had any knowledge of it, nor is it found in any of the early monuments of Hindostan, but after the Mohammedan invasion of India it was generally adopted in that country. The grandest dome that has remained to us from antiquity is that of the Pantheon at Rome, which, though 19 centuries have passed over it, still retains all its stability and magnificence. Its exterior presents the appear-

ance of a truncated segment of a sphere, considerably less than a hemisphere, and has a circular opening in the top 28 ft. 6 in. in diameter. The base consists of a large plinth, with six smaller ones above it. It appears that originally there were flights of steps at intervals all around the dome leading up to the eye, but only one such is now visible, the others having been covered with lead. The interior is a hemisphere of about 71½ ft. radius, and the distance from the floor to the top of the dome is equal to the diameter. The thickness is 17 ft. at the base, 5 ft. 1½ in. at the top of the highest plinth, and 4 ft. 7 in. at the eye. The ceiling is ornamented with five rows of quadrilateral compartments converging toward the top, each large compartment having four smaller ones sunk one within another, which were probably once ornamented with plates of silver or covered with bronze. The dome is built of brick and rubble, and rests on a circular wall 20 ft. thick. The baths of ancient Rome afford many examples of this kind of roof: those of Diocletian had three domes, two of which remain; and those of Titus are crowned by two, each 84 ft. in diameter. Near Pozzuoli is an ancient circular building with a dome of volcanic tufa and pumice stone, and the temple of Minerva Medica had a polygonal dome of ten sides, constructed of pumice stone and brick. That of the church of St. Sophia at Constantinople was built in the reign of Justinian, with the professed design of rivaling the glory of the Pantheon. The plan of the church was a cross, and at the angles of the square where the transepts cut the nave, the architect placed four columns at a distance of about 115 ft. apart, and over them threw arches. The triangular spaces at the corners were then filled up to a level with the extradoses of the arches, and on the ring thus formed the dome was built. In ignorance of the principle of hooping, the builder resorted to various expedients to resist the lateral pressure of the superstructure, and, after it had twice fallen in, was obliged to fill up the large arcades on the N. and S. sides with three tiers of small arches. This dome was destroyed by an earthquake a few years after its completion. The present one is of nearly the same diameter (107 ft.), 46 ft. high, supported by corbellings at the angles of the square, and encircled by a row of windows with exterior columns. It is surmounted by a lantern. The church of St. Mark at Venice, begun in 977, has five domes; the central one, which is much larger than the others, was hooped with iron in 1523. The dome of San Vitale at Ravenna consists of a hemisphere resting on an octagon with eight piers at its angles, and a window on each face. The great dome of the church of Santa Maria del Fiore, the cathedral of Florence, was begun by Arnolfo di Lapo or Arnolfo di Cambio da Caille about 1298, but after the death of the original architect (about 1300) no one could be found for upward of a century to finish it; it

was finally undertaken by Filippo Brunelleschi, who brought it nearly to completion. He improved upon the original design by carrying up perpendicular walls in the shape of an octagon to a height of 175 ft., and upon these placing two concentric domes, the internal one being 138 ft. 6 in. in diameter and 133 ft. 6 in. high from the top of the internal cornice of the supporting walls to the eye of the lantern. This is the first double dome with which we are acquainted. That of St. Peter's at Rome, the grandest in the world after that of the Pantheon, is also double. It stands upon four piers, each 61 ft. 11 in. high and 30 ft. 10 in. thick, from which spring arches supporting corbellings finished by an entablature. The entablature upholds a plinth, circular within and octagonal without, and on the latter rests a circular stylobate 28 ft. 6½ in. thick and 12 ft. 4½ in. high, divided into three parts by passages, forming flights of steps communicating with four spiral staircases in the thickness of the wall of the drum, which rises immediately from the stylobate. The drum is pierced with 16 windows, between which are a corresponding number of solid buttresses 51 ft. 6 in. high. Above it is placed a circular attic 19 ft. 2¼ in. in height, and on this rests the great double dome, the internal diameter of which at the base is 138 ft. 5 in. and the external 148 ft. To the height of 27 ft. 8 in. the dome is solid. Its curve describes externally the arc of a circle whose radius is a little over 84 ft., and its height from the attic to the top of the internal dome is 83 ft. 10 in. It is pierced outwardly by three rows of small windows and strengthened by 16 projecting vertical bands. The whole is crowned by a lantern resting on a platform surrounded by an iron railing and having a cross on the top, the height from the external plinth of the dome to the cross being 263 ft. The top of the cross is 430 ft. above the ground line. This great work was planned by Michel Angelo, who died before its completion, and was finished under the pontificate of Sixtus V., who caused the exterior to be covered with lead, and the bands with bronze gilt. Owing to the haste with which the work was pushed forward the domes settled vertically in many places, and the band of iron around the inner dome was broken. Six iron circles were consequently placed around the outer dome, secured by iron wedges, and the fractured hoop was repaired. The dome of St. Paul's, London, built by Sir Christopher Wren, is double, and rests on an attic and a drum placed on four great arches over the intersection of the four naves. The external dome is of wood, covered with lead, and ornamented with panels formed by projecting ribs. It is surmounted by a lantern supported on a conical tower terminated by a spherical dome. The height of the tower is 86 ft. 9 in., and that of the whole structure from the ground line is 365 ft. The diameter of the dome is 145 ft., and its internal height from

the springing 51 ft. The dome of the Pantheon (or St. Geneviève's) at Paris is entirely of stone, and is supported by four triangular piers rising from the centre of a Greek cross. It is triple, having besides the inner and outer vaults an intermediate structure built to carry the lantern. The internal dome is 66 ft. $8\frac{1}{2}$ in. in diameter at the springing; the external 77 ft. $8\frac{3}{4}$ in. The height of the edifice above the ground line is 190 ft. The reading room of the British museum, opened in May, 1857, is covered by a magnificent dome 140 ft. in diameter and 106 ft. high from the ground. It is built principally of iron, with brick arches between the main ribs supported by 20 iron piers. Between the vaulting and the exterior covering of copper a space is left for the equalization of the temperature, and between the vaulting and the inner decorated ceiling is a similar air chamber for ventilation. There are 20 large windows around the base of the dome, and an eye in the top 40 ft. in diameter. The cast-iron dome of the capitol at Washington has a height of about 55 ft., and an internal diameter of 94 ft. 9 in. The height of its ceiling from the floor of the building is 220 ft. The exterior of the structure presents a peristyle 124 ft. $9\frac{1}{2}$ in. in diameter, with columns 27 ft. high, from which springs an attic 44 ft. high, supporting the great dome of a semi-ellipsoidal form, the top of which is 230 ft. above the pavement. Above this rises a lantern, 52 ft. high and 17 ft. in diameter, crowned with a bronze statue of Liberty 18 ft. high. In the interior there is a vertical wall raised upon the cornice of the rotunda, with a panel 9 ft. high richly sculptured; above this is a series of attached columns and large windows, and above these springs a dome which, contracting to a diameter of 65 ft., permits a second dome, 73 ft. in diameter, resting also on a colonnade, to be seen through the opening.—Domes are sometimes made convex below and concave above, in which form they take the name of Moresque, Turkish, or Hindoo. In Russia they are very frequently built of a bulbous shape, and many of the churches are surmounted by five, representing Christ and the four evangelists. The Isaac's church at St. Petersburg, founded in 1819 and consecrated in 1858, has a central dome of iron covered with gilded copper, with a small rotunda rising from the centre; it is in the Byzantine form, having a diameter of 87 ft. 4 in. and a height of 275 ft. above the floor, or, including the lantern, of 327 ft. Four smaller domes rest on each corner of the edifice. The dome of the temple of the Saviour at Moscow, built to commemorate Russia's triumph over Napoleon, is 84 ft. in diameter; its interior height above the floor is 225 ft. 9 in., and its exterior height, including the cross on its summit, is 343 ft. This dome is supported by four pillars, each 21 ft. in diameter.

DOMENECH, Emmanuel, a French traveller and author, born about 1815. He early became a

priest, and went as missionary to Texas and Mexico, and on his return to France was appointed honorary canon of Montpellier. In 1862 he was chaplain of the French army in Mexico, and subsequently attached to Maximilian's cabinet. He has published *Journal d'un missionnaire au Texas et au Mexique* (1857); *Voyage dans les solitudes américaines* (1858); *Voyage pittoresque dans les grands déserts du nouveau monde* (1861); *Les Gorges du Diable* (1864); *Légendes irlandaises* (1865); *Le Mexique tel qu'il est* (1867); and *Histoire du Mexique, Juarez et Maximilien: correspondances inédites* (3 vols., 1868). Prim and others contested the historical veracity of the last named work. His *Manuscrit pictographique américain, précédé d'une notice sur l'idéographie des Peaux Rouges* (1860), was published at the expense of the government, with a facsimile of a manuscript in the library of the Paris arsenal, relating as he fancied to the American Indians, but which the German orientalist Julius Petzholdt declares to consist of scribbling and incoherent illustrations of a local German dialect. Domenech asserted the authenticity of the manuscript in a pamphlet entitled *La vérité sur le livre des sauvages* (1861), which drew forth a reply from Petzholdt, translated into French under the title of *Le livre des sauvages au point de vue de la civilisation française* (Brussels, 1861).

DOMENICHINO, or **Domenico Zampieri**, an Italian painter, born in Bologna in 1581, died in Naples, April 15, 1641. His first master was Dionysius Calvart, from whose tyranny he took refuge in the school of the Carracci, of which, in spite of a natural timidity and a slowness which his fellow pupils attributed to stupidity, he was eventually considered the most distinguished pupil. He lived apart from men, and rarely went abroad save to make studies for future use. After studying the works of Correggio at Parma, he joined Annibale Carracci at Rome, and assisted him in decorating the Farnese palace. He soon after received commissions from Cardinals Borghese, Farnese, Aldobrandini, and others, for whom he painted works which increased his reputation, but raised a host of enemies. His picture of the "Communion of St. Jerome," now in the Vatican, which has been called second only to Raphael's "Transfiguration," was discovered to bear a slight resemblance to a composition on the same subject by Agostino Carracci, and Lanfranco, a former fellow pupil, took advantage of the fact to decry the picture and the artist. Domenichino was finally compelled by the jealousy of his rivals to retire to Bologna, whence he was recalled by Gregory XV. in a few years to become principal painter and architect in the pontifical palace. Here he renewed his triumphs, and was invited to Naples to paint the chapel of St. Januarius, but died before the completion of his work, not without suspicion of poison. Among his chief works are the "Four Evangelists," in S. An-

drea della Valle at Rome, "Adam and Eve," the "Martyrdom of St. Agnes," and "Diana and her Nymphs." His fresco paintings, of which the scenes from the life of the Virgin in the Duomo at Fano are the best specimens, are admirable. His landscapes, although rather decorative, are uniformly good. He never wholly freed himself from the mannerism of his school, and was defective in invention; but in the free conception of nature, and in the expression of emotion, he approaches nearer Raphael and his contemporaries than any of the eclectics. Many of his works have been engraved by Raphael Morghen and others.

DOMESDAY (or **Doomsday**) **BOOK**, or **Book of Winchester**, a register of the lands of England, framed by order of William the Conqueror. According to some historians it was begun in 1080 or 1083, according to others at the close of 1085; the book itself records its completion in 1086. Persons called the king's justiciaries

Domesday Book.

visited in person or by deputy the greater part of the kingdom, and obtained the required particulars on oath from the sheriffs, lords of manors, parish priests, reeves of hundreds, bailiffs, and villeins of each vill. The record contained a list of the bishops, churches, religious houses, great men, king's manors, king's tenants *in capite*, and under tenants; the particulars of the name of each place, its holder, its extent, the extent of wood, meadow, and pasture, the ponds and mills, the quantity of live stock, the value of the whole, the homages of each manor, the number of villeins, *cotarii*, *servi*, and freemen, and how much each freeman or socman had. Three estimates of the estates were made, viz.: as they were in the time of Edward the Confessor; as they were bestowed by William; and as they were at the time of the survey. The jurors were, moreover, required to state whether any advance could be made in the value. The returns of the justiciaries were sent to Winchester, and being there digested

were entered in two volumes, which were carried about with the king and great seal, or deposited in a chapel or vault of the cathedral called *Domus Dei*. From the last circumstance the name Domesday is thought by some to be derived. Others ascribe it to a parallel drawn between the decisions of the book and those of the day of doom. The first volume, called the "Great Domesday," consists of 382 folio pages closely written on vellum, and contains the survey of 31 counties; the second, or "Little Domesday," is in quarto, of 450 pages, and comprises the returns from Essex, Norfolk, and Suffolk. It has also a list of "invasions," or lands possessed without royal authority. Northumberland, Cumberland, Westmoreland, and Durham do not appear in the record, for which various reasons are assigned. Other counties are described, either wholly or in part, under adjacent divisions. No account is given of Winchester or of London. As a census of the population the Domesday book is of no value, but with regard to the ancient tenure of lands its authority is supreme. It names only 1,400 tenants *in capite* and 8,000 under tenants, and enumerates only 282,242 inhabitants. The book is now preserved in the chapter house at Westminster. A facsimile of it was published by order of government in 1783, having been ten years in passing through the press; and in 1816 the commissioners of public records published two supplementary volumes, one containing a general introduction to the survey with indexes, and the other the four similar records called the "Exon Domesday," the *Inquisitio Eliensis*, the *Liber Winton*, and the "Boldon Book," or survey of Durham. The last of these was made by Bishop Hugh Pudsey in 1183; the *Inquisitio Eliensis* is of the 13th century; the others are contemporary with the Domesday book. In the exchequer office are two other large volumes under the latter title, which are merely abridgments of the original register. Many interesting particulars relating to the survey are found in Kelham's "Domesday Book illustrated" (8vo, London, 1788), and in Morgan's "England under the Norman Occupation" (1858). A facsimile of the portion of Domesday book relating to Cornwall, produced by photozincography, was published in 1861.

DOMICILE, the place where by law a man is deemed to reside. There has been much confusion and conflict of opinion as to what shall constitute a person's domicile, which, as will be seen, is not necessarily the same as his residence. The general conclusions may be stated as follows: 1. The domicile of the parents at the time of a child's birth is the child's domicile, though if the child be illegitimate it takes the domicile of the mother. 2. The domicile of origin continues until a new one is acquired, and the domicile of the husband and father is presumptively that of the wife and children, though if they reside apart from him, not temporarily merely, but by permanent voluntary

or judicial separation, they are capable of acquiring a distinct domicile of their own. 3. The domicile of origin is lost immediately when a person of full age, or legally competent to act for himself, takes up his abode elsewhere with the intention of abandoning the former and of remaining permanently in such new place of abode. To these rules it may be added that presumptively the place where a man lives is his domicile, where nothing to the contrary appears. The law of domicile is specially important as regards the transmission and disposition of property. While the conveyance and descent of real property are governed by the law of the place (*lex rei sitæ*), personal property, on the other hand, for the purposes of distribution in cases of insolvency and intestacy, and also of disposition by testament, is to be governed by the law of the owner's last domicile. This is a principle universally recognized, without regard to the location of the property, except that a state may doubtless exercise the right to appropriate property actually within its limits to the satisfaction of claims due to its own citizens, to the exclusion of claimants abroad. As regards belligerent rights and liabilities, if a person reside in a country which is at war with another, his property will be lawful prize as belonging to a belligerent; or if the country be neutral, he is entitled to the privileges of a neutral in respect to *bona fide* trade. The residence which gives this neutral right is sometimes spoken of as a domicile, but it is obvious that the term as thus used has no other meaning than actual residence and engagement in business, which it will be seen does not *per se* constitute a domicile in respect to other legal incidents. A single exception is made in the case of a person who leaves his own country *flagrante bello*, it being thought inconsistent with his natural allegiance that he should be permitted to enter into neutral relations with the enemy after war had actually commenced. On the same principle greater strictness would probably be insisted upon in regard to the nature of the residence when the question was between the emigrant and his native country; even if he went abroad before the breaking out of hostilities; yet it is difficult to see how even in that case it could be required that a domicile should have been acquired other than results from actual residence abroad for *bona fide* business purposes.—The rule of the civil law that a man may have two domiciles, as where he resides a part of the year in one place and a part in another, or where he is carrying on business in two places, is repudiated in England and in the United States.

DOMINIC, or Domingo (called **DE GUZMAN** since 1555), a saint of the Roman Catholic church, and founder of the order of preachers, or friars preachers, born in Calahorra, Old Castile, in 1170, died in Bologna, Aug. 4, 1221. His father's name was Felix. His mother, Juana de Aza, revered as a saint in Spain, placed him

in his seventh year with his uncle the arch-priest of Gumiel de Izan, and at the end of his 14th sent him to the university of Palencia. At the age of 20 he lost his mother, commenced the study of theology and canon law, and in his 25th year was in priest's orders, teaching dogmatic theology and Scripture in the university, and creating a wonderful impression by his sermons. About this period he sold his furniture and books to relieve the poor during a famine, and offered himself in bondage to the Moors to redeem a Christian prisoner. In 1198 the bishop of Osma, Martin de Bazan, appointed him a canon of his cathedral, and promoted him to the dignity of sub-prior and arch-deacon when he soon after reformed his chapter. Diego de Azeves (or Azevedo), De Bazan's successor, chose Dominic as his associate, when charged in 1203 with negotiating the marriage of the heir of Castile with a princess of Lussignan. In passing through southern France the ambassadors were grieved at the disorders prevalent among nobles and churchmen, and the dangers to the Catholic church from the spread of the Albigensian doctrines. Dominic was entertained in Toulouse by a leading Catharist, who questioned him on their doctrinal differences, and acknowledged on the spot his own error. This, historians say, gave Dominic the first idea of founding a society of learned priests devoted exclusively to the work of preaching. The matrimonial negotiation having been happily concluded, the ambassadors were again despatched to escort the bride to Castile, but they only arrived in time to see her carried to her grave. This event, and what they had witnessed in their second journey through Languedoc, inspired the ambassadors with the resolution of trying in their own persons what preaching supported by a life of self-denial could effect to win back the Catharists, and rouse Christians of all classes to a sense of duty. They proceeded to Rome, obtained the approval of Innocent III. with a two years' leave of absence for the bishop, and were soon back in Montpellier, where they met the legates commissioned to suppress heresy in the ecclesiastical province of Narbonne. These were Cistercian monks, living in great state, while the Catharists avoided all reprehensible display. The bishop forthwith dismissed his retinue, induced the legates to do likewise, placed himself at their head, and they all set out on foot for Narbonne and Toulouse. They preached to the Catholics in the churches, and held conferences with the Albigenses in their houses. At Caraman, near Toulouse, they made a number of conversions; in Béziers, where the Catharists were in a majority, Dominic's eloquence attracted large multitudes, but produced no effect otherwise; in Carcassonne, where the bishop of the city had been exiled, they met with insult; and, turning once more toward Toulouse, they stopped at Fanjaux for eight days. There occurred an event much dwelt upon by Dominic's early

biographers. In a public conference a doctrinal exposition was drawn up on both sides, and presented to the Catharists chosen to preside. Unable to agree, both manuscripts were submitted to the test of fire, Dominic's remaining, as it is said, untouched by the flames. It was at Fanjaux that he conceived the project of erecting a monastery for the education of daughters of poor but noble parents, who were the object of Catharist proselytism. Foulques, just appointed bishop of Toulouse, gave him for that purpose the church of Notre Dame de Prouille, near which a monastery was begun at once, and soon became one of the educational centres of France. In the spring of 1207 this first series of missions was concluded by a two weeks' conference at Montréal, near Prouille, when the test of fire was again resorted to, and 150 persons abjured the Catharist doctrines. The bishop of Osma had now to return to his diocese, leaving Dominic at the head of the missionaries. His death and the murder of Peter de Castelnau occurring almost simultaneously, Dominic saw himself forsaken by all but a few secular priests just as the crusade against the Albigenses commenced. He remained with his little band in the neighborhood, watching, says the early biographer, over his rising establishment of Prouille, and increasing his efforts to gain or to retain the good opinion of the Albigenses. For seven years was the land wasted by religious and civil war. Dominic has often been represented as one of the instigators of this bloody strife, but, as appears, unjustly. He and his companions ceased not to preach to the afflicted populations, and to terrify into humanity the swarms of freebooters (*routiers*) who infested the country. He is only mentioned once in the authentic acts of this war, as having been seen praying in the church of Muret on Sept. 13, 1213, while the battle was going on outside between the forces of De Montfort and the king of Aragon. Dietrich of Apolda, his earliest historian and almost his contemporary, says of him during these years, "He continued to combat heresy by his discourses, his examples, his miracles." Another writer of the epoch mentions his name once in connection with the punishment of heretics, and it is to tell how Dominic saved one poor wretch from the stake. From the records of that period we gather that during this whole war Dominic never ceased to labor in Languedoc; that he was respected by the leaders on both sides; that (save in the single instance mentioned above) the authentic acts do not speak of him; he is named in no letter sent to Rome, in no letter coming from it, and in no official document published there concerning the war, the inquisition, or the punishment of Albigenses. The devotion of the rosary, established by him in those days, indicates an influence far from sanguinary. (See ROSARY.) In 1215, at the fall of Toulouse, Dominic with his companions repaired thither. He had seen how little of religious pacification

the crusade had achieved, and what seeds of hatred it left behind. His old idea of trying what an army of true priests could effect now returned. Foulques, the bishop of Toulouse, applauded it. Six of his fellow missionaries had resolved to follow him in realizing it. One of them, Pierre Cellani, a native of the city, appropriated his own house for their residence; and the bishop assigned them the church of St. Romain, with the sixth part of all the diocesan tithes for their support, appointing them at the same time "preachers in the diocese of Toulouse." Innocent III., solicited by the bishop and Dominic, encouraged the project, which was in accordance with the recommendations of the 18th Lateran council, but bade Dominic choose for his society one of the existing rules of monastic orders. Hastening back to Toulouse, Dominic found 16 companions where he had left six, and took them with him to Prouille, where after much deliberation they adopted the rule of St. Augustine, modified in accordance with their proposed mode of life. On Dec. 22, 1216, two separate bulls of Honorius III. approved and confirmed the new society; and a third, issued in the following January, is addressed to them as "preachers in the country of Toulouse," and "preachers" has been their official title ever since. Dominic was at the same time appointed *magister sacri palatii* (master of the sacred palace), that is, theologian and spiritual director of the pontifical household. On Aug. 15, 1217, Dominic and his brethren recited their solemn religious vows in the church of Prouille before a vast concourse of persons of every rank. After the ceremony he proceeded to carry out his design of taking possession of the three great centres of learning, Paris, Bologna, and Rome. After making his brethren elect a superior general to serve in his absence, he set out for Rome on foot and with a single companion, seven of the remaining religious being despatched the same day to Paris. On Dominic's arrival in Rome, the pope assigned to him the vacant church and ruinous cloister of San Sisto on the Caelian hill. Dominic, besides preaching frequently to the papal household, preached also in every church in Rome, sometimes delivering several discourses daily. By order of the pope he reformed at this time the female monasteries of Rome, making the cloistered nuns observe a strict reclusion, and giving them the rule and habit of St. Augustine. This was the origin of the Dominican nuns. At this time also he founded a "tertiary order" or "third order of penitence," composed of persons of both sexes and all ranks of life, bound by no vows, nor required to quit their secular occupations and domestic duties, but taking on themselves the obligation of avoiding worldly pleasures and vanities, of repairing the wrongs they had committed, of being true and just in all their dealings, and of practising charity according to their means. The establishment of San Sisto was soon given up to the Dominican

nuns, and the rapidly increasing community of friars was transferred by the pope to Santa Sabina on the Aventine, where his own palace was. The flower of the nobility and priesthood now demanded admission to the new order; and among the postulants were Hyacinth and Ceslas Odrowaz, since canonized, nephews to the high chancellor of Poland, and Reginald, dean of the chapter of Orleans and doctor of canon law in the university of Paris, whose eloquence and learning were chiefly instrumental in establishing the friars preachers in Bologna. In the autumn of 1218 Dominic, after visiting Languedoc, where the existence of his establishments was threatened, founded a convent in Madrid, and another in Segovia, which became the Dominican centre in Spain. Thence, at the invitation of Blanche of Castile, he went to Paris, where he found the seven sent from Prouille increased to 30, and occupying at the Narbonne gate the church and hospital of St. Jacques, from which the Dominicans in France derived their denomination of Jacobins. After establishing houses in Limoges, Rheims, Poitiers, Metz, and Orleans, he set out for Bologna. On arriving there in the summer of 1219 he found that the church and convent of Mascarella, first given to his brethren, had been exchanged for the church and convent of St. Nicholas, which has been considered as the cradle of the Dominican order in Italy. Reginald's eloquence had taken the city and university by storm; the *élite* of the professors and students had entered the novitiate, and Dominic found a sufficient number to send to the chief cities of northern and central Italy to found houses there. It was at his first arrival in Bologna that he tore in pieces a deed presented to him by a wealthy citizen of all his personal estates. He declared he wished to see his followers beg their bread rather than clog their usefulness by the possession of property. This love of poverty he extended to everything connected with his order, dwelling, furniture, and fare; he even banished from the churches all splendid vestments, and confined the use of silver and gold to the service of the altar. Dominic and Francis of Assisi met this year in Perugia, and the former proposed to unite into one body the two societies which they had founded, a proposal to which Francis would not listen. But both, when asked by Cardinal Ugolino, in whose house they met, if they would allow their sons to accept ecclesiastical preferments, replied that it would be the ruin of religious humility. Dominic was present in 1219 at the first general chapter of the Franciscans, and in 1220, at the first general chapter of the friars preachers, made the Franciscan legislation concerning religious poverty binding on all his followers. The second general chapter was held in Bologna May 30, 1221. It was attested by numerous witnesses at his canonization, that in bidding farewell to the professors and students of Bologna, he predicted he should cease

to be among the living before the 15th of August following. Acting on this presentiment, he went to Venice to recommend his order to Cardinal Ugolino, afterward Pope Gregory IX.; and after visiting some of his followers elsewhere he arrived in Bologna July 31, 1221, wayworn and faint. He persisted in attending the midnight service with the community, and on retiring to his cell was seized with a violent fever accompanied with dysentery. He refused to accept a bed offered to him, but lay on a sack filled with wool. On the morning of Aug. 4 he warned those around him that the end was at hand. They laid him, at his request, on sackcloth and ashes, where he received the sacraments of the dying, pronounced a fervent blessing on his children far and near, and breathed his last as noon was about to strike.—The life of Dominic has been written, among many others, by Dietrich of Apolda and several other ecclesiastical writers of the 13th century; by Castillo (Madrid, 1584), Nicholas Janssen (Antwerp, 1622), Tournon (Paris, 1739), and Lacordaire (1840, 1844, and 1858). See also *Saint Dominique et les Dominicains*, by Elme Marie Caro (Paris, 1853); the Bollandists, under date of Aug. 6; and the first volume of Mamachi's *Annales Ordinis Predicatorum* (Rome, 1756).

DOMINICA, a British West India island, one of the Lesser Antilles, Leeward group, 29 m. S. of Guadeloupe, in lat. 15° 18' N. and lon. 61° 32' W.; length from N. to S. 29 m., breadth 16 m.; area, 291 sq. m.; pop. in 1870, 28,517, of whom only a small number are whites, the majority being emancipated slaves. It is of volcanic origin, and when viewed from the sea presents the appearance of a confused mass of mountains; the highest summit has an elevation of 5,300 ft. Dominica has upward of 30 rivers and numerous rivulets, sulphurous and thermal springs, and a deep lake on a high mountain 6 m. from Roseau. Among its mountains are many fertile valleys, with a black and rich soil well adapted for raising every tropical production. The temperature ranges from 69° to 88°. The wet season continues from September to January, though rains frequently fall during the other months. The chief exports are sugar, molasses, rum, coffee, and cocoa; the chief imports are wheat, flour, dried fish, linen, and cottons. In 1870 the imports were valued at £60,277, the exports at £62,246; the revenue was £15,721, the expenditures £15,248, the public debt £7,230. There are 16 free schools; but the majority of the population being Roman Catholics, education is mainly in the hands of the clergy. The woods swarm with bees, which produce great quantities of wax and honey. This is the European bee, much larger than the native bee of the West Indies.—Dominica was discovered by Columbus in 1493; and being equally claimed by England, France, and Spain, it was considered a neutral island by those three powers till 1759, when it was captured

by the English; and it was ceded to England by France in 1763. It was recaptured by the French in 1778, and restored to England in 1783. Its government is administered by a lieutenant governor, aided by an executive council of 7 members, and a legislative assembly of 14 members, of whom 7 are nominated by the crown and 7 elected by the people. Capital, Roseau, on the S. W. side of the island; pop. about 5,000.

DOMINICAL LETTER (Lat. *dominica*, the Lord's), the letter used in the calendar to denote Sunday for a given year. The council of Nice (325) established the rule that Easter Sunday should be the first Sunday after the full moon which happens upon or next after March 21. For the purpose of determining when Easter falls, and for other similar problems concerning the day of the week and the day of the year, it was early found convenient to place the first seven letters of the alphabet in succession against the days of the months, putting A to Jan. 1, and repeating the seven letters as often as necessary until Dec. 31. The letter which falls against the first Sunday in January will fall against every Sunday in the year, and this is the dominical letter for that year, unless it be leap year; and then, as Feb. 29 as well as March 1 is marked D, the dominical letter for the last ten months of the year will be the preceding letter of the alphabet. Finding the dominical letter will enable one to find what day of the week a given date in the year is. But the dominical letter, being known for any one year, can be found for any other, by simply remembering that an ordinary year is 52 weeks and 1 day, a leap year 52 weeks and 2 days, so that the dominical letter will go backward from G toward A, one letter for a common year and two for a leap year. This gives rise to an arithmetical rule which may be thus expressed: To the number of the year add one quarter of itself, neglecting fractions, and divide the sum by 7; then for the 19th century subtract the remainder from 8, or, if it is 0, from 1, and the new remainder will indicate the place of the dominical letter in the alphabet; for the 18th century subtract from 7; for the 17th century, and back to 1582, the year in which the Gregorian calendar went into operation, subtract from 6, or if the remainder is 6, from 13; for dates previous to 1582 subtract from 3, or if the remainder is 3 or more, from 10. But the dominical letter thus obtained for a leap year belongs to the time after Feb. 29, and for the preceding two months the dominical letter was the succeeding letter in the alphabet. This new remainder is also the date of the first Sunday in January for that year. The same date in February will fall on Wednesday; in March, on Wednesday; in April, on Saturday, &c.; as may be seen from the fact that the first days of the 12 months have annexed to them in the calendar the initials of the words: At Dover Dwell George Brown, Esquire, Good Christo-

pher Finch, And David Friar. For example, the day of the week on which New York was incorporated, June 12, 1665, is thus found: $(1665 + 416) \div 7 = 297$, with a remainder of 2; and, it being the 17th century, $6 - 2 = 4$, which shows the dominical letter for that year to have been D. Then, as June begins with E, June 1, 1665, was Monday, and the 12th was Friday. President Barnard of Columbia college gives the following rule for finding the dominical letter: Give to the letters A, C, E, G, in which order the dominical letters return with the leap year centurial in every succession of four centurial years, the numerical values which correspond to their places in the alphabet, 1, 3, 5, 7; find in this series the number corresponding to the given century, and call this the centurial; multiply the twenties of the incomplete century by 3, and call the product the vigesimal; multiply the fours in the excess of twenties by 2, and call the product the quaternial; multiply the final remainder by 6, and call the product the residual. If the sum of the numbers thus obtained is 7 or less, it is the numerical value of the dominical letter; if it is greater than 7, subtract 7 as often as may be necessary to reduce it to 7 or below, and the final result is the dominical letter.

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DOMINICANS, Order of Preachers, or Friars Preachers (Lat. *Fratres Prædicatores*; Fr. *Frères-Prêcheurs*), a Roman Catholic monastic order, founded by St. Dominic. (See DOMINIC.) When in 1215 Dominic and his six companions took up their abode in Toulouse, in the house of Pierre Cellani, they had agreed to wear the habit and follow temporarily the rule of the canons regular of St. Augustine. This rule and habit had been given by St. Norbert, in 1121, to the community founded by him at Prémontré, which spread so rapidly throughout Europe. St. Norbert aimed at uniting the observances of monastic life with the office of preaching and the cure of souls. To the Augustinian rule, as it existed before him, he added several regulations tending to stricter poverty and greater severity of life. The rule of St. Norbert, so modified as to make it still more austere, was that which Dominic and his companions deliberately chose in Pronille in 1216, and which was approved by Honorius III. in his two bulls of Dec. 22 of the same year. The new features given by St. Dominic to the rule of Prémontré may be thus described: 1. As the order of preachers has for its object the salvation of souls by preaching and other priestly ministrations, as well as by the example of a holy life in the preacher, the superior of every convent has discretionary power to dispense from the common rules and observances, which may occasionally prove obstacles to the end in view. Thus, where fasting or abstinence is incompatible with preaching, teaching in public, necessary study, or the fatigues of a missionary life, the superior is empowered to grant a relaxation; the rule of

silence in the interior of the monastery is dispensed with when strangers apply for spiritual instruction or comfort; and no unnecessary time must be given to the recitation of the divine office in the church, or the performance of church ceremonies, when the duty of preaching and careful preparation for it are more urgent. 2. Each convent is governed by a "conventual prior;" each province, composed of a certain number of convents within a definite territory, by a "provincial prior;" and the whole order by a "master general" (*magister generalis*), called simply "general." Every charge, from the highest to the lowest, is elective. The conventual prior is chosen for three years by the priests in each convent who are six years professed; the provincial prior is chosen for four years by the conventual priors, former provincial priors residing in the province, functionaries called fellows (*socii*) of the provincial, chosen one by the members of each convent, and the priests appointed to the office of "preachers general;" the master general is elected every six years by the provincial priors, *diffinitores* chosen one by each province, who accompany the provincial to the general chapter, fathers enjoying the dignity of masters in theology, and former masters general. On the other hand, the general confirms the election of the provincials, and the provincials that of the conventual priors. General chapters, held at short intervals, control the administration of the general; provincial chapters serve as a check upon the provincial prior; while in each convent a council assists the prior in his government of the house. This economy, equally removed from oppression and from license, is favorable to manly independence and natural freedom of action, and has preserved the order of preachers from the divisions which have rent asunder the Franciscans. It was the aim of their founder that strict poverty should be the corner stone of the edifice he was rearing; hence the order was to accept no property that needed to be managed, but only the income derived from it. To this rule the Dominicans remained faithful until the multiplication of their houses, the apparent necessities of the times, the solicitations of princes and bishops, the authority and even the command of popes, gradually led them to modify and relax the stringency of the original legislation on the holding of property. In the first years of their existence their extreme poverty contributed not a little to their wonderful growth in numbers, efficiency, and influence. They had early taken possession of Rome and Bologna, where their masters in theology, philosophy, and canon law became the controlling intellectual power; and from these great centres they spread through all the chief towns of Italy. In Paris they, as well as the Franciscans, met from the very commencement with nothing but disfavor and opposition on the part of the university. In 1228 they obtained one professorship, and in 1230 a second. The popularity

which their lectures enjoyed, and the superiority attributed to them by the public, excited even at that early period fierce denunciations against the "begging preachers and friars." But, besides the two public chairs in the university thus filled by the Dominicans, there were a considerable number of others teaching in the schools of Paris; for it was the rule that no one should receive a degree of "master of arts" who had not taught for three years under the direction of the Parisian faculties. The Franciscans, too, were at that time neither less ambitious of intellectual preëminence, nor less successful, nor less numerous in the schools of Paris. So, besides the vehement emulation which existed between the two new mendicant orders, there arose a bitter hatred against both among the secular professors of the university. After many bickerings, this feeling broke out into a scandalous quarrel in 1252, on the occasion of a refusal by the friars to suspend their courses in conformity with the university rules. The friars and their disciples by public decree were for ever excluded from all university honors, and the faculty went so far as to bind both professors and students by oath to maintain this exclusion. King and pope had to interfere; and it was only in 1260 that a compromise was effected which was most oppressive to the Dominicans. Still the two great orders persisted in sending to Paris their most renowned doctors and most promising scholars; and then began the intellectual contest between the two rival schools of philosophy and theology, represented by Dominicans and Franciscans, which is the history of the European mind during the middle ages. Just as the quarrel with the university broke out Albertus Magnus had come to teach in Paris, bringing with him his disciple Thomas Aquinas, and to these two greatest names among the Dominicans was soon added Vincent of Beauvais. On the side of the Franciscans were found Roger Bacon, Alexander of Hales, John Duns Scotus, and St. Bonaventura. The theological supremacy which the teaching of Thomas Aquinas soon gave to the friars preachers, together with the undisputed control exercised by them in the schools of Bologna, and the official position as supreme theological and literary censors held in Rome by the "masters of the sacred palace," continued down to the time of the Jesuits to exercise decided influence over the intellectual life of Europe.—Their missionary activity meanwhile kept pace with their mental culture. When the second general chapter of the order was held in Bologna in 1221, under St. Dominic himself, 60 conventual establishments were already in existence. The field over which their labors actually or prospectively extended was mapped out into eight provinces, among which were England and Hungary; and before the assembly dispersed, Dominic despatched missionaries to take possession of these two kingdoms. Gilbert de Frassiniet with 12 companions soon pre-

sented himself to the archbishop of Canterbury, who sent them to labor in Oxford, where they built a chapel in honor of Our Lady, and founded schools called "St. Edward's schools," from the parish in which they were situated. Robert Grosseteste, bishop of Lincoln, was so pleased with the new comers that he asked the general of the order to send him a Dominican as a coadjutor. Not only bishops, jealous for the salvation of their flock, but princes such as Louis IX. of France, careful of the welfare of their subjects, eagerly sought to have near them men who could enlighten the multitude by their doctrinal expositions and edify them by a blameless life. This was the need of the age, pressed on the attention of bishops by the last council of the Lateran. They therefore spread rapidly, and, as Neander remarks, their advent was hailed everywhere as a benefit, among the poorer classes especially, to whose wants they ministered, and whose poverty and privations they willingly shared. Carrying out the oft expressed wish of their founder, they also crossed over into Asia, where they did much both among the Mohammedans and eastern schismatics. In 1233 they were appointed conjointly with the Franciscans to carry out the new rules of the inquisition in France. Though this tribunal never exercised permanent authority outside of Langue doc, the connection of the mendicant orders with it became a principal cause of unpopularity in the rest of France. The use which the court of Rome made of the friars in collecting moneys added much to these commencements of disfavor; while the ministrations for which they were called into the houses of the great made their enemies say they were afraid to reprove princes and prelates for their misdeeds. In 1245 occurred their first official departure from the rigorous poverty which had hitherto attracted many to the order of Dominic; they were authorized by the holy see to accept donations and legacies. In 1277 the order had 35 convents for men in Spain, 52 in France, 32 in Tuscany, 46 in Lombardy, 53 in Germany, 36 in Poland, 28 in Denmark, and 40 in England, besides some in other countries, and a large number of nunneries. In 1278 the convents amounted to 417; and the number went on increasing until the reformation, when they lost upward of 400 establishments in the Protestant countries. In the 15th century the Dominicans were chosen to preside over the Spanish inquisition, when that tribunal became a state establishment. Under Philip II. and his successors, although ecclesiastics had but little to do with the working of that institution, the odium created by such men as Torquemada attached to the Dominicans in public estimation. With the rise of Jesuits about 1543 came a new era of rivalry and intellectual activity for the old monastic orders. In every centre of civilization in the old world, and on every field of missionary duty in the East and West, Jesuits and Dominicans vied with each other

in learning and zeal. The latter had followed Albuquerque and his Portuguese to the East Indies, where they had founded everywhere flourishing missions; and there Francis Xavier found them at work when he began his career some 40 years later. The Dominicans followed in like manner the Spaniards and Portuguese to America. From 1503 to 1616 no fewer than 16 "expeditions" were sent by the Dominicans to the Antilles and all parts of North and South America, each expedition made up of a large number of religious; besides which small bands of missionaries were continually crossing the ocean to fill up the voids caused by death, &c. After the example of Las Casas, the friars preachers were everywhere the benefactors of the native races, and their protectors against European brutality.—In the middle of the last century the order possessed upward of 1,000 convents, distributed into 45 provinces, 11 of the latter being out of Europe. By the French revolution they lost all their establishments in France and Belgium, and during the reign of Napoleon I. nearly all their convents in Germany, and very many in Italy. Three convents are allowed at this time (August, 1873) to remain open in Rome. Elsewhere throughout the Italian peninsula they are suppressed by law. In Bologna, the cradle of the order, three priests and two lay brothers are permitted to live in a private house; the grand old convent of St. Nicholas is shut up, the splendid church with all its treasures of art is ignored as a place of worship, and a few religious who still cling to the memories of the place are allowed to visit it daily, and see that no harm befall its monuments. In the German empire the recent law suppressing the Jesuits makes no mention of the friars preachers. In France the order was restored by Lacordaire under Louis Philippe. Several houses were established by him, among them a flourishing college at Sorèze, and another at Arcueil, near Paris, some of whose professors and pupils were massacred by the communists, May 19, 1870. There are at present two provinces of the order in France and one in Belgium. In England there are five Dominican convents, and in Ireland 12 with about 50 priests. In Spain, Portugal, and Russian Poland they have ceased to exist. In the Austrian empire they are still tolerated. In the United States there are eight houses of the order, six east of the Rocky mountains and two in the Pacific states, numbering in all 70 priests. In Spanish and Portuguese America the Dominicans lead a precarious existence, constantly exposed to the political caprices of the parties in power. In 1872 they were expelled from Guatemala. In spite of these adverse circumstances, the Dominicans still maintain their missionary establishments in European Turkey, Asia Minor, Armenia, India, China, and Anam. Eastern Anam had at the beginning of this century 25 convents of native nuns, numbering some 600 inmates. In spite of the

persecutions which have repeatedly dispersed and sometimes decimated them, these establishments, protected by France, are beginning to flourish anew. Various attempts have been made to restore the order to the rigor of its pristine observance; among them one in the beginning of the 17th century, by Père Michaélis, provincial of Toulouse, which so far succeeded that in 1608 Pope Paul V. erected the reformed convents into an independent congregation, governed by a vicar general. In 1650 Père Le Quien endeavored to push this reformatory movement still further; he established six convents in Provence and the comtat Venaissin, which embraced the primitive rule in all its rigor. When Pius IX. announced (June 19, 1847) his intention of reforming the monastic orders, Lacordaire and his French Dominicans were among the first to encourage him and to accept the proposed change; it was a Frenchman, Père Jeandel, who was appointed vicar general by the pope when he suspended for a time the authority of the general chapter. Since then the work of reform has been carried on incessantly, the calamities which have befallen the order making it easier for the true-hearted among its members to embrace, as their assured pledge of future usefulness, the high abnegation of their founder.—The influence exercised by the order of preachers on the schools of the middle ages and on the whole of European society for several centuries cannot be exaggerated. It has given to the whole world such men as Albertus Magnus, Thomas Aquinas, Vincent of Beauvais, Master Eckard, John Tauler, Henry Suso, Savonarola, Las Casas, Vincent Ferrer, and a host of other distinguished names; and in our own day the friars preachers have seen their ancient glory revive in Lacordaire, and in Monsabré, who now fills his place in Notre Dame de Paris; as well as in Father Thomas Burke, who in 1872-'3 traversed the United States, thrilling everywhere by his eloquence vast assemblages of his countrymen. It has given to the church a host of bishops and archbishops, 66 cardinals, and four popes, Innocent V., Benedict XI., Pius V., and Benedict XIII. The influence of the order on the fine arts has exceeded that of all others. "The Dominicans," says Mrs. Jameson, "have produced two of the most excellent painters who have drawn their inspirations from religious influences, Angelico da Fiesole and Bartolommeo della Porta," called Il Frate in the schools. Among countless monuments of painting and sculpture executed for their former monasteries and churches, is the famous "Last Supper" by Da Vinci, in Sta. Maria delle Grazie in Milan. As to the Dominican nuns, the house founded in Prouille by St. Dominic, and which afterward adopted his rule and habit, became the parent of many similar institutions throughout France. In Rome the Dominican nuns, and the "third order" established by Dominic, spread through Italy. The nuns however did not long maintain the original severity of their

rule. They shared also, in France, in the various attempts at reform made by the monks. At present they have convents in France, Belgium, Austria, Bavaria, Switzerland, in the British empire and some of its colonies, as well as in North and South America.—See Altamura's *Bibliotheca Dominicana* (fol., Rome, 1677); Castillo's *Historia general de Santo Domingo y de su orden de predicadores* (2 vols. fol., Madrid, 1584-'94; 2d ed., 5 vols. fol., Valladolid, 1612-'21); Tournon, *Histoire des hommes illustres de l'ordre de Saint Dominique* (6 vols. fol., Paris, 1743); and Riboll, *Bullarium Ordinis FF. Prædicatorum* (8 vols. fol., Rome, 1729-'40).

DOMINIS, Marc' Antonio de, a theologian and natural philosopher, born in Arbe, an island of Dalmatia, in 1566, died in Rome in September, 1624. He was a relative of Pope Gregory X., studied at Loretto under the direction of the Jesuits, and became a member of their order. He taught mathematics and philosophy with great success in several cities of Italy. In 1602 he left the Jesuits, and was appointed archbishop of Spalato and primate of Dalmatia and Croatia. He now began to oppose some of the measures of the court of Rome, and his writings were condemned by the inquisition. This gained him the sympathies of Protestants, by whom he was induced in 1616 to pass into England, where he embraced Protestantism, and was made dean of Windsor. Though his avowed aim was to effect a reunion of the two great divisions of Christendom, he wrote and preached against the papacy. In his work *De Republica Ecclesiastica*, he maintained that the pope is only *primus inter pares*; it was censured by the theological faculty of Paris, and burned by order of the inquisition. Not long after its publication he reverted to his former theological views, publicly retracted all that he had ever written against the Roman Catholic church, and repairing to Rome abjured his apostasy. His inconstant humor did not long leave him in repose, and it was suspected that he had repented his last conversion, and was meditating a return to Protestantism. He was imprisoned by Pope Urban VIII., and his sudden death soon after caused the report that he was poisoned. His trial for heresy was continued after his death; he was convicted, and his body was disinterred and burned along with his writings. His chief philosophical work is entitled *De Radiis Visus et Lucis* (Venice, 1611), to which Newton ascribes the first true explanation of the rainbow.

DOMINOS, a game which has been traced by some authors to the Greeks, Hebrews, and Chinese. Its first appearance in western Europe is not ancient, it having been introduced into France from Italy about the middle of the last century. The domino is a small flat oblong of wood, ivory, or bone, divided on one side by a line into two compartments. Each of these is marked with a certain number of dots, from 1 to 6, or is left a blank, so that upon

each domino there is a different combination of numbers. The game is played with 28 dominos, the reverse sides of which are unmarked and all alike. This side being up, each player takes an equal number of the dominos. The person who has drawn the one which has the highest number of points puts it down; the next domino played has to be one with a number the same as one of the two numbers presented by the first, and the two similar ends are joined. The next may match the remaining number of either the first or the second domino, and thus the game continues till one player has put down all his pieces. There are a number of variations in the mode of playing this game. The combinations are neither very varied nor intricate, and yet it requires memory and calculation.

DOMITIAN (Titus Flavius Domitianus Augustus), a Roman emperor, born Oct. 24, A. D. 51, killed Sept. 18, 96. He was the younger son of Vespasian, and narrowly escaped death at Rome by concealing himself when his father was proclaimed emperor by the legions of the East. On the fall of Vitellius he ruled the capital as Cæsar till the return of his father. Having then exhibited a sanguinary and licentious temper, he was excluded both by Vespasian (69-79) and Titus (79-81) from all share in public affairs, and spent his time on an estate near Rome, in effeminate pleasures, as well as in writing and reciting poetical compositions. On the death of Titus, which was ascribed to him by the people, he was hailed emperor by the soldiers. At the beginning of his reign he concealed his vices, and even manifested some firmness in the regular management of affairs; but he soon began to display his vanity and jealousies. Almost every citizen of Rome who was noted for wealth or learning was either murdered or banished. In his wars he was personally unsuccessful against the Catti and other German tribes, as well as against the Dacians, whose king Decebalus compelled him to purchase peace on humiliating terms. These reverses, however, did not prevent him from triumphing and decorating himself with the names of Germanicus and Dacicus. Government officials, says a historian, were busy in keeping the people of Rome from laughing on such occasions. Games were employed to amuse them. Agricola, the heroic commander in Britain, was recalled because of his victories, and the jealousy of his fame probably caused his subsequent death. War having been terminated by an ignominious peace with Decebalus in 89, Domitian satiated his thirst for blood at home, until, as Tacitus says, silent fear reigned at Rome. After many fruitless conspiracies, he was finally killed by three officers of his court who had been warned of their intended death by the emperor's wife Domitia, whom he had also doomed.

DOMREMY, or *Domremy la Pucelle*, a village of Lorraine, France, on the Meuse, in the department of Vosges, 7 m. N. of Neufchâteau, the

birthplace of Joan of Arc. The cottage in which she was born had become a stable, but was repaired in 1820 at the expense of the government, and a free school for girls connected with it. A chapel has also been dedicated to her, and a monument raised in her honor, to which Louis Philippe contributed in 1843 a cast of the statue of the maid of Orleans executed by his daughter Princess Marie.

DON (Lat. *dominus*, lord or master), a title of honor among the Spaniards, the feminine form being *doña*, and the corresponding title among the Portuguese being *dom*. It is used even by the king and the royal princes, and was formerly assumed by the nobility only with the consent of the sovereign, but is now merely a title of respect used by all classes. Don is also sometimes employed in France as a clerical title. The old English form of the word is *dan*, frequently used by Chaucer.

DON. I. A river of Russia, the Tanais of the ancients, and the Tuna, Duna, or Dana of the Tartars. It is one of the largest rivers of Europe. It rises in a small lake in the government of Tula, flows S. E. and S. W., passes Voronezh, Pavlovsk, Novo-Tcherkask, Tcherkask, Nakhitchevan, Rostov, and Azov, and enters the sea of Azov by three mouths, only one of which is navigable. Its length, including windings, is nearly 1,000 m., though from its mouth to its source in direct line is but 468 m. In summer navigation is difficult, but in winter the water is high enough, and the stream becomes navigable to Zadonsk, about 800 m. from its mouth. The course of the river lies through a low country, covered with vast forests of oak and pine. The current is sluggish, and sand banks, over which there are often only two feet of water, are of frequent occurrence. Opposite Dubovka the Don approaches the Volga to within 40 m., and a railroad connects the two rivers between Kalatch and Tzaritzin. The principal tributaries are the Sosna and the Donetz on the right, and the Voronezh (or Voronetz), the Khoper, the Medveditsa, the Sal, and the Manitch on the left. **II.** A river of Aberdeenshire, Scotland, next to the Dee in size, but of little commercial importance. It rises on the declivity of Ben Aven, flows a tortuous easterly course of about 70 m., and enters the North sea near Aberdeen. It is navigable for a very short distance from the sea. Near its mouth stands the celebrated one-arched Gothic bridge of Balgownie. A handsome new bridge of five arches has been built a little below the old structure. The salmon fisheries of the Don are of considerable value. **III.** A river of Yorkshire, England, 55 m. long, rising near the borders of Cheshire, and flowing into the Ouse. It is navigable from Sheffield, a distance of 40 m., and communicates by canal with the Trent and the Calder.

DOÑA AÑA, the S. E. county of New Mexico, bounded E. by Texas, and S. by Texas and Mexico; area, about 20,000 sq. m.; pop. in

1870, 5,864. The Rio Pecos intersects the E. part, and the Rio Grande flows through the W. portion. Several mountain ridges cross the country. The chief productions in 1870 were 23,324 bushels of wheat, 98,590 of Indian corn, and 14,000 lbs. of wool. The value of live stock was \$71,740. Capital, Doña Aña.

DONALDSON, John William, an English scholar, born in London, June 10, 1811, died there, Feb. 10, 1861. He was educated at the university of London and at Trinity college, Cambridge, where he graduated in 1834, and was made a fellow in 1835. After being some time assistant tutor there, he took orders and became head master of the grammar school of Bury St. Edmund's. In 1855 he resigned, and removed to Cambridge, where he gave a course of lectures on Latin synonymes, and occupied himself with private teaching and writing. In 1856 he was appointed one of the classical examiners of the university of London. In 1860 he travelled for his health in Germany, but returned without improvement, and removed to London, where he resided until his death. His most celebrated work is "The New Cratylus" (1839; 3d and enlarged ed., 1859), which was the first attempt on a large scale in England to bring out the principles of comparative philology established by German scholars. His *Varronianus* (1844) undertook to accomplish for Latin philology what "The New Cratylus" had done for Greek. "The Theatre of the Greeks," his earliest work, is still used as a college text book. He also published grammars of the Greek, Latin, and Hebrew languages, editions of Pindar, and the "Antigone" of Sophocles, and was engaged on a new Greek lexicon when his health failed. He also wrote *Jasher, Fragmenta Archetypa Carminum Hebraicorum* (Berlin, 1854; London, 1860), an attempt to restore the "Book of Jasher," alluded to in the Scriptures, and "Christian Orthodoxy" (London, 1857).

DONATELLO, or properly **Donato di Berto di Bardi**, one of the revivers of sculpture in Italy, born in Florence in 1383, died in 1466. His parents were poor, and he was brought up by a rich relative. He at first applied himself to painting, but subsequently to sculpture, and found in Cosmo de' Medici, the chief of the Florentine republic, a patron able to perceive and to reward his merits. The "St. Peter" and "St. Mark" which adorn the church of St. Michael in his native city were his first great works. He afterward studied in Rome, and occupied himself with repairing the injuries to the ancient sculptures. He particularly excelled in works in *rilievo*, among which were the "Nativity and Burial of Christ" and the "Assumption of the Virgin." His group of "Judith and Holofernes," executed in bronze for the community of Florence, that of "St. George," the finest ornament of the church of St. Michael, and his "Zuccone," representing an old man in the costume of a senator, have met with the approbation of succeeding times.

He was buried in the church of San Lorenzo, by the side of Cosmo de' Medici. Nothing irritated him more than to see his works sold to persons unable to appreciate them, and he sometimes broke a finished piece to save it from such a destiny.

DONATI, Giovanni Battista, an Italian astronomer, born in Pisa in 1826, died in Florence, Sept. 20, 1873. In 1852 he became an assistant in the observatory of Florence, where he soon gained distinction, especially by his discovery, on June 2, 1858, of the comet which bears his name. He had been anticipated in a similar discovery made in 1854; but he established his claims of priority in those seen by him on June 3, 1855, Nov. 10, 1857, and July 23 and Sept. 9, 1864. He also made important investigations on the spectra of comets, the solar disk, and the stars, and in 1862 published *Spectra di quindici stelle*. In 1864 he visited England, and in the same year succeeded Prof. Arni as director of the observatory of Florence. Through his exertions was inaugurated in 1872 the royal observatory on the hill of Arcetri, near Florence, memorable as the site of Galileo's tower. He was director of this and professor of astronomy in the royal institution of Florence at the time of his death, just previous to which he had represented Italy in the international meteorological congress at Vienna.

DONATISTS, a party in the ancient north African church, so called from two of their leaders named Donatus. In 311 Mensurius, bishop of Carthage, died, and the majority of the clergy and people hastened to choose in his stead his archdeacon, Cæcilian. This election was ratified by the bishops of the province of Carthage, one of whom, Felix of Aptungis, acted as consecrator. All this haste both in the election and consecration was to avoid the interference of the bishops of the neighboring province of Numidia, between whom and Mensurius a bitter strife had existed on the treatment of the lapsed and the validity of all priestly acts performed by an unworthy minister. As Cæcilian had been a strong supporter of Mensurius throughout his administration, Secundus, the primate of Numidia, and Donatus, bishop of Casæ Nigræ, his counsellor, were particularly anxious to exclude him from the succession. No sooner had Cæcilian been consecrated than Secundus and Donatus arrived at the head of 70 Numidian prelates. Two deacons, competitors of Cæcilian, now became his accusers before this assemblage of bishops, to which none of the suffragans of Carthage were admitted. The validity of Cæcilian's ordination was impugned, because Felix of Aptungis, they said, was a *traditor*, that is, one who had given up the Scriptures and sacred vessels to the pagans during the late persecution of Diocletian. As Cæcilian, though willing to submit to a new election, refused to acknowledge the Numidian bishops as his lawful judges, he was deposed and the lector Major

rinus was consecrated bishop of Carthage. Thus there were two bishops at the same time in the one see, each with a powerful party of bishops and laymen. The disorders which ensued were so great that in 312 Constantine expressly excepted "the party of Majorinus" from the privileges which his first edicts conferred on the churches of Africa. The aggrieved party thereupon appealed to him, and requested to be judged by a court of Gallic bishops. The emperor referred the matter to Melchades, bishop of Rome, who pronounced the charges against Cæcilian groundless, and declared the leading accuser, Donatus of Casæ Nigræ, guilty of several transgressions of ecclesiastical law. Donatus and Majorinus appealed a second time to Constantine, begging to have the whole matter judged in Gaul, where the late persecution had not raged and no traitors existed. The emperor acquiesced, appointing a council to meet in Arles, and commanding the proconsul of Carthage, Ælian, to investigate judicially the accusation against Felix of Aptungis. Ælian pronounced Felix innocent, and convicted his accuser of having falsified the record in order to sustain his charge. The council of Arles met Aug. 1, 314; bishops from Italy, Spain, Gaul, Africa, and Great Britain heard both parties, and reaffirmed the sentence of the court of Rome. The emperor was once more appealed to, and summoned both parties before himself at Milan in 316. His decision was in conformity with that of the ecclesiastical courts. But Donatus and Majorinus and their followers raised the cry that Constantine had been biased in his decision by Hosius of Corduba. The emperor now had recourse to legal repression, and severe edicts were issued against "the party of Majorinus." In the same year, 316, Majorinus died, and was succeeded by a second Donatus, a man of great learning, austerity of life, and enthusiastic and headlong disposition. His followers gave him the appellation of Great, and from him called themselves "the party of Donatus," while their opponents styled them Donatists. He excited his followers to resist the imperial edict. Fearful retaliations followed everywhere the attempts to coerce the Donatists, and at length in 321 Constantine suspended the execution of his edicts, but the conflict between the parties still continued. In 330 upward of 200 Donatist bishops met in council, enacted decrees favorable to the reconciliation of traitors, and proclaimed themselves the only true church of Christ. Unfortunately for their cause, it had been espoused from the beginning by a large class of fanatics known as *circumcelliones*, "hut-rovers," in the rural and mountainous districts of northern Africa. They had contributed not a little to provoke the barbarities of the pagans during the late persecution, by committing deeds of violence and folly while the persecution lasted, in order to secure martyrdom for the faith. From the beginning of the schism they had

been the soldiers of the Donatists. Constans on his accession determined to employ both bribery and coercion against the Donatists. His commissaries Macarius and Leontius distributed everywhere large sums of money and rich presents in the emperor's name, accompanying them with exhortations to Christian unity, and threats of serious repression against recalcitrants. Donatus of Carthage repelled the imperial officer and his presents. "What has the emperor to do with the church?" exclaimed he, although he and his party had been the first to invoke the imperial intervention. Donatus sent his warning voice through all northern Africa, and the whole country rose in arms. In 349 Macarius defeated the united forces of the Circumcelliones in a pitched battle near Bagaja or Bagaïs, and then no alternative was left the vanquished but extermination or submission to the emperor's edicts. Their churches were taken from them, and their religious meetings were dispersed by force of arms. The accession of Julian in 361 brought them peace; their churches were restored, and their confiscated property was given back to them. The wild excesses into which they were hurried by this short-lived triumph only made their condition more intolerable under Gratian and his successors. Internal divisions added to their sufferings. In 393, 100 Donatist bishops assembled at Cabarsussi in the Byzacena, deposed Primianus of Carthage, and ordained in his stead Maximian, his accuser. In 394 a council of 310 bishops reversed this sentence; but still the Donatists continued split into two factions, the "Primianists" and "Maximianists." During the latter half of the century the voice of theological controversy had been heard above the unceasing clash of arms. Parmenian, successor of Donatus of Carthage, had vindicated his followers in works which were refuted by such men as Optatus of Mileve and Augustine of Hippo. But reasoning and argument could not be listened to amid this civil and religious warfare. In 398 Augustine, after trying in vain to bring about a peaceful discussion of their mutual grievances, obtained an order that the bishops of the province of Carthage should meet yearly to devise means of healing the schism. In 411 at length a fortunate concurrence of circumstances led to what is known as the great conference of Carthage, in which, under the presidency of the imperial commissary, Marcellinus, 286 Catholic bishops and 279 Donatists discussed during three days the points which divided them. Once more the two oft disputed questions were argued on both sides, whether Felix of Aptungis and Cæcilian were traitors, and whether the church, by communicating with unworthy members, lost the character of the true church of Christ. What then shook the allegiance of many Donatist bishops to their party was the offer made in the conference by the Catholics to receive the Donatist bishops

on a perfect footing of equality with themselves in every episcopal city. This gave a blow to the schism from which it never recovered. The most stringent measures of repression were immediately put in force against the obstinate, with the unavoidable results of agrarian violence and retaliation. In 429 Genseric and his Vandals swept over all northern Africa, an invasion which proved equally destructive to Catholics and Donatists. The latter still maintained a foothold along the Mediterranean coast and in the mountains for the remainder of the century, and then disappeared altogether.—The Donatists held that the sacraments from the hand of one not properly ordained for the work were of no value, rebaptized those who came from the Catholic churches into their communion, and consecrated anew the sacred edifices which they took from their rivals. Donatus and others of his party were accused of denying the Trinity; but from this charge they are absolved by Augustine, who shows that they differed from the Arians in recognizing but one divine substance.—Accounts of the Donatists may be found in the works of St. Optatus; in the writings of Augustine, in the 9th part of the Benedictine edition, the appendix of which also contains monographs relating to them; in Tillemont, vol. vi.; in the "Dissertation" of Collina (Bologna, 1758); in Ballerini's history; in De Potter's *Histoire du Christianisme*, vol. ii. (Paris, 1836); in Villemain's *Tableau de l'éloquence chrétienne au V^e siècle* (new ed., 1854); and in Ribbeck's *Donatus und Augustinus* (Elberfeld, 1857).

DONAUWÖRTH, a town of Bavaria, in the district of Swabia and Neuburg, situated at the confluence of the Wörnitz with the Danube, 25 m. N. N. W. of Augsburg; pop. about 3,500. It has manufactures of linen and leather, and some trade in corn, flax, wool, and cattle. It sprang up around the castle of Wörth, and became an imperial city. The inhabitants early embraced the reformation, and in 1606 so misused the Catholics that the city was in the following year placed under the ban of the empire. This punishment was one of the causes of the thirty years' war. In the war of the Spanish succession Marlborough and Louis of Baden achieved here a victory over the French and Bavarians (July 2, 1704).

DON BENITO, a town of Estremadura, Spain, near the left bank of the Guadiana, in the province and 57 m. E. of the city of Badajoz; pop. about 15,000. The town is well built, with wide and clean streets, and several public squares. It contains a prison and a convent. Woollens, wine, and oil are manufactured here, and considerable trade is carried on, both by the river and by rail.

DONCASTER, a town of England, in the West Riding of Yorkshire, 32 m. S. of York; pop. in 1871, 18,758. It is on the river Don, which is here navigable, and in a cultivated district. Its grain market is the largest in the kingdom,

and it has manufactures of agricultural machines, iron, brass, and linen. But it is chiefly noted for its horse races, established in 1703. The famous St. Leger stakes were founded in 1776. The race course is nearly two miles in length, and one of the finest in the kingdom. The races are held annually in the third week of September, and continue for five days. Doncaster is the *Danum* mentioned in the itinerary of Antoninus; hence its Saxon name *Dona Castre*, and its present name. The town was frequently sacked by the Danes. Prior to the reformation, it was the seat of several convents of Carmelites, and white, black, and gray friars. A new parish church, to replace the old one destroyed by fire in 1853, was finished in 1858, at a cost of £52,000. Roman antiquities are frequently found in the city and vicinity.

DON COSSACKS, *Land of the, or Province of the Army of the Don*, a government of South Russia, lying between lat. 46° 10' and 51° 10' N., and lon. 37° 10' and 44° 15' E., and bordering on the governments of Saratov, Astrakhan, Voronezh, Kharkov, and Yekaterinoslav, the sea of Azov, and Caucasia; area, 61,934 sq. m.; pop. in 1867, 1,010,135. It is generally flat and sandy, the greater part of it being a steppe, but in the south there are low hills, the last of the ramifications of the Caucasus. It belongs to the basin of the Don, which receives several important tributaries within its limits, the principal of which are the Donetz on the right bank, and the Manitch and the Kheper on the left. The climate is generally mild and agreeable, but intense cold and violent storms sometimes prevail in winter. Cattle raising is the chief employment of the inhabitants; but along the rivers, where the soil is good, agriculture is followed with fair results. The cereals are raised to some extent, as well as hemp and flax, and light wines, scarcely inferior to those of France, are made. Fish constitutes a large part of the food of the people, sturgeon, salmon, and carp abounding in the rivers. Caviar made from the roe of the sturgeon is highly esteemed, and is exported in large quantities. Another chief article of export is salt, which is made from saline lakes in the south of the province. The seat of government is at Novo-Tcherkask, at the confluence of the Aksai with an arm of the Don. (See COSSACKS.)

DONDERS, *Frans Cornelis*, a Dutch physician, born at Tilburg, May 27, 1818. He studied at the university of Utrecht, practised at the Hague, and for many years has resided at Utrecht, where he has established an institution for treating diseases of the eye, with a physiological laboratory, completed in 1867. His system of treating ophthalmic diseases is set forth in his elaborate work, *Die Lehre von den Augenbewegungen* (Utrecht, 1847). Among his other works are *De leer der stofwisseling als bron der eigenwarmte* (1845), *Natuurkunde van den Mensch* (Ger. translation, 2d ed., Leipzig, 1859); *Ueber die Natur der Vocale* (1858);

and "Anomalies of Accommodation and Refraction" (published in English by the Sydenham society; Ger. translation, Vienna, 1866).

DONEGAL, a maritime county of Ireland, bounded N. and W. by the Atlantic, E. by the counties of Londonderry, Tyrone, and Fermanagh, and S. by the counties of Fermanagh and Leitrim, and by Donegal bay; area, 1,865 sq. m.; pop. in 1871, 217,992. The shores are deeply indented by bays, the most important of which, Lough Swilly, penetrates 25 m. into the land. There are numerous islands off the coast, and several lakes within the county. The general aspect of the surface is mountainous. Nearly two thirds of the land consist of bogs or sterile hills, incapable of cultivation. The chief rivers are the Swilly and the Finn, and the principal towns Ballyshannon, Letterkenny, Ramelton, Donegal, and Killybegs. Oats, barley, flax, and potatoes are the staple agricultural productions. In 1868 there were 231,245 acres under cultivation. The fishery districts in 1867 employed 1,074 boats, with 3,766 men and 778 boys. Linen manufacture is carried on, and there are also many flour mills; the export trade is chiefly through the port of Londonderry. Capital, Lifford.—The town of **DONEGAL** (pop. about 1,600), at the head of a bay of the same name, 29 m. N. E. of Sligo, gives the titles of marquis and earl to the Chichester family.

DONETZ, a river of southern Russia, the principal affluent of the Don. It rises in the government of Kursk, pursues a S. E. course through the government of Kharkov and the country of the Don Cossacks, and joins the Don on the right. Its entire length is about 500 m. Its banks are generally fertile, and its channel is wide and deep. The Oskol, the Aidar, the Kalitva, and some smaller branches join it on the north; and it is navigable up to Zmiev.

DONGOLA, a province of Upper Nubia, in the valley of the Nile, between lat. 18° and 19° 30' N., including the narrow strip on both banks, between the river and the desert; pop. about 60,000. Nearly all the fertile land is on the left bank, the right being mostly barren and covered with drifting sands. The climate is agreeable and generally healthy, although fevers are prevalent in the rainy season, and the heat is great from March to July. On the annual rise of the Nile the low lands along the banks are submerged to the breadth of 12 or 15 m. Thus irrigated and enriched, the country is remarkably productive, yielding two crops annually. Corn and dates are the chief products, but cotton, tobacco, coffee, opium, indigo, sugar cane, beans, and saffron are also raised. The horses of Dongola are of a superior breed, larger than the Arabian. The inhabitants are chiefly of the Ethiopic race, and are of lighter color than other Nubian tribes. Many are descendants of the Mamelukes, who established themselves there in the beginning of this century. They are represented to be indolent, immoral, and selfish, and, notwith-

standing the fertility of the soil, live in abject poverty. Their principal occupations are cattle raising and trading in slaves.—The chief town is New Dongola or Marakah, the capital, on the left bank of the Nile, lat. 19° 10'; pop. about 6,000. It is the seat of a pasha, and has government offices, a bazaar, an indigo factory, and baths. It owes its origin to the barracks built there about 1820, after plans of the naturalist Ehrenberg, to take the place of those destroyed by the Mamelukes at Old Dongola. Not far from the town is the island of Argo, in the river, on which are numerous colossal Egyptian monuments and other remains. Old Dongola, the former capital, on the right bank of the river, 75 m. above New Dongola, is situated on a rock about 500 ft. high, and is surrounded by fortifications which show its ancient importance. It is now a miserable village of a few hundred inhabitants.—Dongola was a Christian country in early times, and was the seat of civilization and power in Nubia. In the 18th century it was overrun by the Sheikia Arabs. About 1812 the Mamelukes, expelled from Egypt, fled thither and attempted to found a government, but they were driven out in 1820 by Ibrahim Pasha, and since that period the country has been a dependency of Egypt.

DONIPHAN, a N. E. county of Kansas, bounded N. by Nebraska, and separated from Missouri on the east by the Missouri river; area, 391 sq. m.; pop. in 1870, 13,969. It is watered by the Missouri and several small streams, is well timbered, and abounds in building stone. The surface consists in part of rolling prairies, somewhat broken near the streams, but gently undulating in the interior. The river bottoms have a rich soil, generally timbered. The old overland route to California crosses the county, and the St. Joseph and Denver City and the Atchison and Nebraska railroads traverse it. The chief productions in 1870 were 158,117 bushels of wheat, 1,326,968 of Indian corn, 148,676 of oats, 28,822 of barley, 206,703 of potatoes, 6,640 tons of hay, and 194,396 lbs. of butter. There were 4,124 horses, 3,868 milch cows, 6,759 other cattle, 4,588 sheep, and 23,272 swine; 8 flour mills, 10 saw mills, 2 manufactories of saddlery and harness, and 1 of woollen goods. Capital, Troy.

DONIZETTI, Gaetano, an Italian composer, born in Bergamo, Sept. 25, 1798, died there, April 8, 1848. He was originally destined for the law, but showing an unusual taste for art, he was placed at the musical institute of Bergamo, then under the direction of Simon Mayer, and subsequently studied at Bologna, under Pilotti and Mattei. At the age of 20 he had composed some short pieces of religious and instrumental music, when the brilliant career of Rossini captivated him, and he determined to write for the stage. His father opposed his plans, and in a pique Donizetti entered the Austrian military service, and while in garrison with his regiment in Venice pro-

duced in 1818 his first opera, *Enrico di Borgogna*. Several other works followed, and in 1822 his *Zoraida di Granata*, produced in Rome, procured him his discharge from the army. His works now succeeded each other with great rapidity, and in 1827 he accepted an engagement with the director of the theatres at Naples, to write four operas a year, two serious and two buffo, for four years. In 1830, when his *Anna Bolena* was produced at Milan, he had written 31 operas, nearly all of which were moderately successful. At this time Bellini appeared, and Donizetti, who had hitherto been a professed imitator of Rossini, modified his style by borrowing somewhat of the pathos of his young contemporary. He went to Paris in 1835 to compete with him, but without success, his *Marino Faliero* being eclipsed by Bellini's *Puritani*. He returned to Naples, and in six weeks composed his *Lucia di Lammermoor*, the success of which consoled him for his disappointment. In 1840 he returned to Paris, and brought out *Les martyrs*, *La favorita*, and *La fille du régiment*. The reputation acquired by these and other works procured him the appointment of professor of counterpoint at the royal college of music in Naples, and of chapelmaster and composer to the court of Vienna. His last operas were *Don Sébastien* (produced at Paris in 1843, which he wrote out in two months, remarking at the close of his labors, "*Don Sébastien will be the death of me*") and *Catarina Cornaro*, produced at Naples in 1844. Soon afterward a mental affection, the result of early habits of dissipation and of excessive application, compelled him to abstain from work, and for the last few years of his life he was the inmate of a lunatic asylum. In addition to the works specified, he composed *Lucezia Borgia* (Milan, 1833), *Linda di Chamounix* (Vienna, 1842), *Don Pasquale* (Paris, 1843), and *Maria di Rohan* (Vienna, 1843). He produced more than 60 operas, most of which, in consequence of the haste and carelessness with which he wrote, have sunk into obscurity. In the fulness and variety of his melodies, and in his appreciation of dramatic fitness in single or concerted scenes, he stands almost unrivalled, and some of his works will probably long retain their hold upon popular favor. His facility was such that he was known to write out the score of an opera in two days.

DON JUAN, a mythical personage, a type of licentiousness and dissipation, accomplished and wicked, represented with all the graces which win woman's heart, and all the snares which beguile woman's virtue. According to tradition, the patrician family Tenorio of Seville was the first to produce a Don Juan sufficiently remarkable to become the representative man of the order. His life is placed by some legends in the 14th century under the reign of Pedro the Cruel, and by others in the 16th century in the era of Charles V. He is represented to have been in the act of abduct-

ing a daughter of the governor of Seville when caught by her father; a duel ensued, in which the governor was slain. A statue having been erected to the deceased in the family vault in the convent of San Francisco, Don Juan enters the vault and invites the statue to join him in his revels. The stony guest appears at the banquet to the great amazement of Don Juan, and terminates the festivity by consigning his entertainer to the infernal regions. The story was first dramatized at the beginning of the 17th century by the Spanish poet Gabriel Tellez, commonly called Tirso de Molina, under the title of *El burlador de Sevilla, ó el convidado de piedra*. This drama, soon after its publication, was adapted for the Italian stage, and thence found its way to Paris, where it became the basis of several French adaptations, of which Molière's *Don Juan, ou le festin de pierre*, and Thomas Corneille's production, modelled after Molière's play, are the most celebrated. In England a play written by Shadwell, called "The Libertine," and treating the same subject, was performed in 1676. The subject was not produced on the Spanish stage in its present form till the early part of the 18th century, when it was rewritten by Antonio de Zamora. This version of Zamora furnished the groundwork of the modern treatment of the theme. Goldoni published his *Giovanni Tenorio* about the middle of the 18th century. Gluck followed with a ballet in 1761, Vincenzo Righini with an opera, and Lorenzo da Ponte with the text to Mozart's opera in 1787, which appeared in the same year. This is the masterpiece of this great composer, and at the same time the most remarkable production to which the legend of Don Juan has given rise. Apart from the opera and the drama, the Don Juan literature has found in the present century a new field in the sphere of romance and poetry in Spain and France; while in England the name of Don Juan was adopted by Byron as a congenial title for his famous poem. The two characters of Faust and Don Juan are blended in one and the same personage in a German drama by Grabbe, while a great number of plays, novels, and translations from the Spanish on Don Juan abound among German books of the present day.

DONNE, John, an English poet, born in London in 1573, died there, March 31, 1631. He was of a Roman Catholic family, studied at Oxford and Cambridge, and was designed for the law, but relinquished it in his 19th year for theology. He abandoned the Roman Catholic church for the Anglican, and travelled for three years in Spain and Italy. On his return to England in 1597 he was appointed secretary to Sir Thomas Egerton, keeper of the great seal, which post he held five years; but having secretly married Anne, daughter of Sir George More, and niece of Lady Egerton, he was dismissed from his situation and for a time imprisoned in the tower. He accompanied Sir

Robert Drury to Paris, and returning to England was presented to James I., by whose command he wrote the "Pseudo-Martyr" to prove that Roman Catholics might conscientiously take the oath of allegiance. At the age of about 41 he entered into orders, and having distinguished himself as a preacher he was made by the king his chaplain in ordinary and dean of St. Paul's, and received from the university of Cambridge the degree of doctor of divinity. His failing health obliged him to desist from preaching, but a calumnious whisper having reached him that his sickness was feigned because he chose to be idle, he ascended the pulpit and preached what his biographer has called his own funeral sermon, which was afterward printed with the title of "Death's Duel." He died soon after. He left sermons and devotional and controversial works, but is best known as a poet. His poems consist of satires, elegies, epigrams, and religious and complimentary verses. His subtle and vivid imagination, and his great simplicity and tenderness, are manifest amid his vast learning and the abounding vicious conceits of his style. He was the first of the series of English poets characterized by Dr. Johnson as metaphysical. His rugged numbers made him little esteemed during the last century, but the scattered gems of poetry and melody in his books have recalled something of his first reputation, and his works have been republished under the editorial care of Dean Alford (6 vols. 8vo, London, 1839). His life was written by Izaak Walton.

DONNYBROOK, or **St. Mary's of Donnybrook**, a parish and village of Ireland, county Dublin. The parish contains the villages of Irishtown, Donnybrook, Merrion, Ringsend, and Sandy-mount. The village (pop. about 2,000), two miles S. E. of Dublin, of which it is a suburb, is situated on the Dodder, here crossed by a handsome bridge, and contains a fine church, a spacious Roman Catholic chapel, a Magdalen asylum, a dispensary, a lunatic asylum, classical and other schools, a hat manufactory, and a number of mills. It is celebrated for its fair, granted by King John, and formerly held during 15 days from Aug. 26, afterward lasting only a week, being merely a pleasure fair. It was originally for the sale of horses and cattle, but became notorious for riot, bloodshed, and debauchery. It was abolished in 1855.

DONOSO CORTÉS, **Juau Francisco Maria de la Salud**, marquis de Valdegamas, a Spanish statesman and author, born at Valle de la Sarena, in Estremadura, May 6, 1809, died in Paris, May 3, 1853. At the age of 12 he entered upon a course of law at the university of Salamanca. He was prepared to receive his degree at the age of 16, but the rules not permitting it until the age of 25, he went to Seville, and employed the intervening years in the study of philosophy, history, and literature. During the divisions which took place in Spain in 1832, with regard to the right of succession to the throne, Donoso presented a memoir to

Ferdinand VII., in which he pleaded the liberal cause. The king rewarded him with a place in the ministry of justice. After the death of Ferdinand he defended the cause of Queen Isabella and her mother. He was elected to the cortes, and afterward appointed secretary to the ministerial council. Differing from Mendizabal, who was at its head, he resigned his post, and devoted himself to the tribune and the press. He was for some time the editor of the *Revista*, and a leading contributor to the *Piloto*, a newspaper founded by himself. During the dictatorship of Espartero he defended the interests of Maria Christina. In this contest he was vanquished, and shared the exile of the queen mother to France as her private secretary, and also accompanied her on her return to Spain in 1843. He was afterward appointed secretary to Queen Isabella, and minister plenipotentiary to the court of Berlin. In his speech in the cortes, Jan. 4, 1849, he renounced so-called liberal ideas, which he designated as sterile and disastrous to human society, whose peace had been disturbed by them for three centuries. At the time of his death he was minister at Paris. A work of his in French, entitled *Essai sur le Catholicisme, le libéralisme et le socialisme* (Paris, 1851), maintains that theology is the proper basis of politics. Among his writings are: *Consideraciones sobre la diplomacia, y su influencia en el estado político y social de Europa* (Madrid, 1834); *La ley electoral, considerada en su base y en su relacion con el espíritu de nuestras instituciones* (1835); and a collection of his speeches and early writings (1849-'50). A complete French edition of his works appeared in Paris in 1859.

DONOVAN, **Edward**, an English naturalist, died Feb. 1, 1837. His first publication was a "Natural History of British Insects" (16 vols. royal 8vo, London, 1792-1816); of a similar character to which were his "Natural History of British Birds" (10 vols., 1794-1818), "Fishes" (5 vols., 1802-'8), "Shells" (5 vols., 1803-'4), and "Quadrupeds" (3 vols., 1820). In 1798 he published an "Epitome of the Natural History of the Insects of China," which was followed by works on the insects of India (1800), and of islands in the Indian and South Pacific oceans (1805). He also wrote a little book of instructions concerning the collection and preservation of subjects of natural history. His later works were a narrative of "Excursions through South Wales and Monmouthshire" (2 vols., 1805), a periodical entitled "The Naturalist's Repository," and an "Essay on the Minute Parts of Plants."

DOO, **George Thomas**, an English engraver and painter, born in the parish of Christchurch, Surrey, Jan. 6, 1800. He produced his first published engraving, "The Duke of York," after a painting by Sir Thomas Lawrence, in 1824. In 1825 he went to Paris and worked in the studio of Suisse, and studied the manner of Gros. He lectured on engraving at

Kensington museum and Harrow, and also on ancient Greek painting, and on the revival of art in the 12th century. He was elected a fellow of the royal society in 1851, associate engraver of the royal academy in 1855, and a royal academician in 1856. He is best known by his engraving of "Knox preaching before the Lords of the Congregation," after Wilkie; his "Combat," after Etty; "Italian Pilgrims coming in sight of Rome," after Eastlake; the "Infant Christ," after Raphael; and the "Ecce Homo," after Correggio. His engraving of the "Raising of Lazarus," by Sebastiano del Piombo (1864), occupied him eight years. In 1867 he exhibited "St. Augustine and Monica," after Ary Scheffer. Of late years he has engraved very little, and has devoted himself to painting portraits in oil.

DOOLY, a S. W. county of Georgia, with a level surface, watered by many small creeks, bounded W. by Flint river; area, 530 sq. m.; pop. in 1870, 9,790, of whom 4,855 were colored. Pine forests occupy much of the land, but the soil is fertile. The chief productions in 1870 were 149,987 bushels of Indian corn, 9,485 of oats, 20,881 of sweet potatoes, 4,132 bales of cotton, and 16,349 gallons of molasses. There were 657 horses, 1,636 milch cows, 3,857 other cattle, 5,592 sheep, and 10,104 swine. Capital, Vienna.

DOON, a lake and river of Scotland, in Ayrshire. Loch Doon is about 6 m. in length, and at no place exceeds three quarters of a mile in breadth. It is enclosed by the Star mountains of Kirkeudbright, abounds in trout, and has an islet on which stands an old castle, reputed to have been once the residence of Edward, brother of Robert Bruce. The river Doon issues from the lake, flows for about a mile through a wild ravine called Ness Glen, and after a N. W. course of 18 m. falls into the frith of Clyde, 2 m. S. of Ayr. About a mile from the sea, close by the river, stands a monument to Burns.

DOOR, a N. E. county of Wisconsin, consisting of a narrow peninsula between Green bay and Lake Michigan; area, 625 sq. m.; pop. in 1870, 4,919. The chief productions in 1870 were 34,585 bushels of wheat, 22,103 of oats, 43,157 of potatoes, 1,835 tons of hay, and 56,861 lbs. of butter. The total value of live stock was \$103,639. Capital, Gibraltar.

DORA D'ISTRIA, the pseudonyme of HELEN GHICA, Princess Koltzoff-Massalsky, a Wallachian authoress, born in Bucharest, Jan. 22, 1829. She is great-granddaughter of Michael Ghika, who was assassinated by the Turks, and niece of Prince Alexander Ghika, hospodar of Wallachia. She received instruction from Professor Pappadopoulos, and early acquired a knowledge of the ancient and modern languages. When 15 years old she translated the Iliad into German, and afterward wrote several plays. She travelled in Europe from 1841 to the close of 1848, and on her return to Wallachia married in February, 1849,

the Russian prince Koltzoff-Massalsky, with whom she went to Russia. From 1855 to 1860 she resided in Switzerland and Belgium, and became known by her writings in the periodical press, as well as in published volumes. In 1860 she travelled in Greece, and in 1861 went to Italy, taking up her residence at Florence. In 1867 the Greek legislature adopted her as a Greek citizen. She is honorary member of several learned societies of Europe, and a Smyrna association elected her president in 1871. Besides her literary works, she has been a successful painter, and two landscapes exhibited in St. Petersburg in 1854 received a silver medal. Among her published works are: *La vie monastique dans l'Eglise orientale* (Brussels, 1855; Paris and Geneva, 1858); *La Suisse allemande et l'ascension du Manich* (Paris and Geneva, 1856; English translation, London, 1858; German, Zürich, 1857-'9); *Les femmes en Orient* (Zürich, 1860; Russian and Greek translations, St. Petersburg and Athens); *Eccursions en Roumèlie et en Morée* (Zürich, 1863); *La Vénitienne* (1864); *Des femmes, par une femme* (Paris and Brussels, 1864; translated into Russian, Italian, and English); and *Gli Albanesi in Rumenia* (2 vols., 1873). She is also the author of several novels, and of pamphlets on philological subjects.

DORAK, a town of Persia, in the province of Khuzistan, situated at the junction of a small river of the same name with the Jerahi, about 30 m. from where the latter empties into the Persian gulf, and about 90 m. S. of Shuster; pop. variously estimated from 6,000 to 12,000. It stands upon a marshy plain, and is defended by mud walls and a fort, and surrounded by date plantations. There is a palace of the governor built of brick, which has long been falling into decay. There are manufactures of Arabian fabrics and garments, and a considerable commerce by means of the canal connecting the Dorak and the Karun, and exports to all parts of Persia and Arabia.

DORAN, John, a British author, born at Drogheda, Ireland, in 1807, died Jan. 26, 1878. He resided many years in France and Germany, took the degree of Ph. D. at the university of Marburg, and afterward went to England, became editor of various periodicals, and in the latter part of his life was editor of "Notes and Queries." His principal works are: "Table Traits, and Something on them" (1854); "Habits and Men" and "Lives of the Queens of the House of Hanover" (1855); "Knights and their Days" (1856); "Monarchs retired from Business" (1857); "History of Court Fools" (1858); "New Pictures and Old Panels" and "The Last Journals of Horace Walpole" (1859); "Lives of the Princesses of Wales" (1860); "The Bentley Ballads" (1861); "Their Majesties' Servants" (1863); "Saints and Sinners" (1868); and "A Lady of the Last Century [Mrs. Elizabeth Montagu], illustrated in her Unpublished Letters, with a Biographical Sketch, and a Chapter on Blue Stockings" (1873).

DORCHESTER, a S. E. county of Maryland, bordering on Delaware and on Chesapeake bay, bounded N. and N. W. by Choptank river, and S. E. by the Nanticoke, both of which are here navigable; area, 640 sq. m.; pop. in 1870, 19,458, of whom 7,556 were colored. It has a level and partly marshy surface, with a soil sandy in some places and clayey in others. The Dorchester and Delaware railroad passes through it. The chief productions in 1870 were 122,460 bushels of wheat, 311,039 of Indian corn, 35,100 of oats, 65,949 lbs. of butter, and 15,368 of wool. There were 1,678 horses, 2,379 milch cows, 5,303 other cattle, 4,401 sheep, and 8,433 swine; 2 saw mills, 2 boat-building establishments, and 3 establishments for canning and preserving fruits. Capital, Cambridge.

DORCHESTER, formerly a town of Norfolk co., Mass., on Dorchester bay, an arm of Boston harbor, contiguous to South Boston, since 1869 constituting the 16th ward of the city of Boston; pop. of the town in 1860, 9,769; of the ward in 1870, 12,259. It was first settled by a party of English Puritans, headed by the Rev. John White of Dorchester, England, who landed at Nantasket, June 11, 1630, and established themselves within the limits of the town on the 17th of the same month. They soon erected a church, but no trace of it now remains. The first water mill in America was built here in 1633, and Dorchester has the honor of having originated about the same time the New England cod fishery.

DORCHESTER (anc. *Durnocæria*), a municipal and parliamentary borough of England, capital of Dorsetshire, near the river Frome, 113 m. S. W. of London; pop. in 1871, 6,915. It contains three churches, several dissenting chapels, schools and charitable institutions, a theatre, large cavalry barracks, and a county museum. It has considerable trade in beer, butter, sheep, and lambs. The Romans surrounded it with a wall. Athelstan made it the seat of two mints, and during the civil war it witnessed many severe battles. After the duke of Monmouth's rebellion in 1685, the assizes were held here by Jeffreys, who sentenced 109 of the insurgents to death, 13 of whom were executed. In the vicinity are the remains of a Roman amphitheatre with seats for 13,000 spectators, and a camp, and of a British station called Maiden castle.

DORDOGNE, a S. W. department of France, bordering on the departments of Haute-Vienne, Corrèze, Lot, Lot-et-Garonne, Gironde, Charente-Inférieure, and Charente; area, 3,545 sq. m.; pop. in 1872, 480,140. It was formed from the old province of Périgord and parts of Agenois, Angoumois, and Limousin. A large part of the land is occupied by marshes; nearly two thirds are considered unfit for cultivation, but the department is very rich in minerals. Iron, copper, lead, coal, manganese, lithographic stones, and marble are found in large quantities. The surface is hilly, and

covered in many places with extensive forests. Chestnuts are abundant, and are cultivated to a considerable extent. Game is plentiful, but cattle, owing to the poorness of the pasture lands, are raised in very small numbers. Red and white wines of good quality are produced; the crops of grain are fair, and the truffles of Dordogne are esteemed the best in France. The principal manufactures are iron, paper, brandy, and liqueurs. The largest rivers are the Dordogne (which rises in Auvergne, flows S. W. and W. through the departments of Corrèze, Dordogne, and Gironde, and with the Garonne forms the Gironde) and its tributary the Vézère, both of which are navigable. The department is divided into the arrondissements of Périgueux, Sarlat, Nontron, Bergerac, and Ribérac. Capital, Périgueux.

DORÉ, Paul Gustave, a French artist, born in Strasburg, Jan. 10, 1833. He early showed a passion for drawing, and his father sent him to the lycéums of Strasburg and Bourges. When only 11 years of age he published his first lithographs. The next year he was brought to Paris, and entered the Charlemagne lyceum, and in 1848 he published his first series of sketches, the "Labors of Hercules," in the *Journal pour rire*, for which paper he drew regularly from this time. In 1854 he illustrated the works of Rabelais. He drew many of the illustrations for the *Journal pour tous* from its foundation in 1856, and in that year illustrated Balzac's *Contes drolatiques* and the legend of the wandering Jew. Among the most prominent of the numerous works he has since illustrated are Montaigne (1857), Taine's *Voyage aux Pyrénées* (1859), Dante (1861-'8), Chateaubriand's *Atala* (1862), "Don Quixote" (1863), Milton's "Paradise Lost" (1865), the Bible (1865-'6), Tennyson's "Idyls of the King" (1866-'8), and La Fontaine's fables (1867). In 1853 he began to exhibit oil paintings, including "Two Mothers," "Alsatian Women," "A Mountebank who has stolen a Child," and some landscapes. The most noted of his pictures are scenes from Dante, especially his "Paolo and Francesca di Rimini," the battles of the Alma and Inkerman, the "Rebel Angels cast down" (1866), the "Gaming Hall at Baden-Baden," the "Neophyte" (1868), the "Triumph of Christianity," and "Christ leaving the Pretorium," which last measures 30 ft. by 20. It is said that he has executed over 45,000 designs.

DORIA, Andrea, a Genoese statesman and admiral, born at Oneglia, Nov. 30, 1468, died in Genoa in November, 1560. He belonged to a family celebrated for the great number of distinguished men it had produced since the 12th century. The influence which this family and those of the Fieschi, the Grimaldi, and the Spinolas exerted upon the destinies of Genoa was so powerful that the four families were called *Magna quatuor Prosapia*, the Dorias and the Spinolas siding with the Ghibelline party, and the other two with the Guelphs. The Dorias

boasted of many high functionaries and four distinguished admirals before the 14th century. Their fame, however, was eclipsed by that of Andrea, who in early life was successively employed in the service of Pope Innocent VIII., of the duke of Urbino, and of Ferdinand and Alfonso II. of Naples; and having passed some time in the Holy Land, he distinguished himself after his return to Italy by his exploits against Gonsalvo de Cordova and the Corsicans. In 1513 he was placed at the head of the navy of Genoa, and soon displayed his remarkable naval abilities, especially by clearing the waters of Genoa of pirates. When political troubles induced him to remove to Monaco, he showed as much public zeal in his retirement as he had while in power, and fitted out at his own expense 12 galleys which he had taken from the corsairs. In the war between Francis I. and Charles V. he accepted the command of the French galleys. After defeating the imperial fleet at Marseilles in 1524, and rendering various other signal services to the cause of France, he took umbrage at the attempt of Francis to injure Genoa by setting up a rival for her in fortifying the city of Savona, and, displeased at the same time with the personal treatment to which he was subjected, he left the French service to join that of Charles V., with whom he stipulated for the freedom of Genoa as the price of his services. By going over to the Spanish-Austrian party he paralyzed the progress of the French in Italy, and expelled them from Genoa (1528). Doria was now invested with the supreme power of Genoa, although he declined the dignity of doge, as this would have prevented him from remaining in the service of Charles V. The senate conferred upon him the name of "the father of peace," and ordered a statue to be erected to him and a palace to be placed at his disposal. He inaugurated a new form of government, making the office of doge biennial instead of for life, terminated the fatal dissensions between the Adorni and Fregosi, and recalled the banished members of the Genoese aristocracy, without however granting them any privileges over the other classes of society. While restoring order and governing the affairs of the republic, he continued to render himself useful to Charles V., who appointed him commander-in-chief of his navy, gave him the principality of Melfi, and raised the number of his galleys to 22. In 1532 he took from the Turks the towns of Coron and Patras in Greece. The conquest of Tunis in 1535 was mainly effected through his skill and bravery. In 1536 he took part in the invasion of Provence, captured Toulon, and carried the war to the gulf of Lyons. After the defeat of the imperial army by the French, he accompanied the emperor to Barcelona; and when a truce was concluded, the interview between Charles V. and Francis I. took place on board of one of Doria's galleys, this opportunity serving at the same time to effect a reconciliation between himself and his former master, the king

of France. In 1539 he neglected to avail himself of his superior force to defeat at Prevesa the Turkish fleet under Khair ed-Din (Barbarossa) of Algiers; and in 1541, during the fatal expedition of Charles to Algiers, he lost 11 of his galleys. Returning to Genoa, he applied himself for the rest of his life to the administration of the affairs of the republic, which was disturbed by the revolution instigated by the Fieschi family. In the outbreak of January, 1547, his nephew Gianettino Doria lost his life, which caused Andrea to punish the conspirators with great severity, and Fiesco himself was drowned accidentally. Doria's death, at the age of 92, was deplored by the Genoese as a national calamity.

DORIANS, the name by which one of the four chief branches of the Hellenes, the descendants of Dorus, son of Ilielen, were distinguished in the history of ancient Greece. In the remotest period they appear on the classic ground between Mount Olympus and Ossa; then, by turns conquering and conquered, in Macedonia, on the island of Crete, in Doris, where they founded the Tetrapolis, and in the Peloponnese, which they entered under the returning Heraclides, and where they became masters of Sparta, Argos, and Messenia. They distinguished themselves from other Hellenic tribes by a character of dignified solidity, of rigid and often rough gravity. This manifested itself not only in their manners, laws, and institutions, so much in contrast with those of the milder Ionians, but also in their dialect, broad and rough, but strong and solemn, and therefore well suited to sacred hymns and choruses; in the light hunting dress of their women, in the strong and unadorned Doric column, in the warlike sounds of their music, and even in the spirit of the Pythagorean philosophy; while everything Ionian was marked by a character of softness, elegance, and taste. Colonies of the Dorians flourished in Italy, Sicily, and Asia Minor.—See K. O. Müller, *Die Doriæ* (2d ed., 3 vols., Breslau, 1844).

DORIS. **I.** A district of Greece, now belonging to the nomarchy of Phthiotis and Phocis, a small mountainous region, watered by the Pinus; anciently one of the smallest divisions of Hellas, inhabited by the Dorians, and bounded by Thessaly, Phocis, Locris, and Ætolia. Of its four confederate cities, the so-called Tetrapolis, built at the foot of Mount Ceta, none was adorned by great names or events. They were soon destroyed by hostile neighbors and were in ruins in the time of the Romans. **II.** In Asia Minor, a portion of the coast of Caria, settled by Dorians. It formed a part of a confederacy originally consisting of six cities, most of them on the neighboring islands, and known as the Dorian hexapolis, which, though dependent at every period of history on some larger state, had a place of national assembly on the promontory of Triopium, where festivals and games were celebrated, and common affairs discussed. Halicarnassus and Cnidus were the

most important towns; the former, however, was early excluded from the league, which from a hexapolis thus became a pentapolis.

DORKING, a market town and parish of Surrey, England, situated in a beautiful valley on the left bank of the Mole, 20 m. S. S. W. of London; pop. about 4,000. It is noted for its romantic scenery. The Dorking fowls, celebrated for their excellent qualities, are supposed to have been introduced here by the Romans. They are usually white or of a partridge color, and have five claws on each foot. The neighboring country contains many beautiful residences, among which are Deepdene, the seat of the late Thomas Hope, and the Rookery, where Malthus was born.

DORMOUSE, a small rodent of the jerboa family, belonging to the genus *myoxus* (Gmelin); this genus has since been subdivided, with the addition of the genera *muscardinus* (Ray) and *graphiurus* (F. Cuv.). The genus *myoxus* has two incisors above and below, and four molars on each side of each jaw divided by numerous transverse bands; the eyes are

Dormouse (*Muscardinus avellanarius*).

large and prominent; the ears large; the whiskers long; no cheek pouches; fore feet with four toes and the rudiment of a fifth; hind feet five-toed; tail long and hairy; fur soft; claws sharp. Dormice live principally on trees, eating fruits, and pass the winter in a state of lethargy, having collected a store of food for use in the spring. All are said by Cuvier to be destitute of a caecum. The best known species are all European. The largest, the fat dormouse or loir (*M. glis*, Linn.), is about 6 in. long, with an ashy brown above, whitish below, with brown about the eyes; the whiskers are strong; the tail is much like that of a squirrel. It resembles the squirrel in its manners, though it is less active, climbing trees with facility, and rarely descending to the ground; it makes a nest of moss in hollow trees, couples in the spring, and brings forth four or five at a birth; it is confined to the south of Europe, and in Italy has from remote times been used as food. As cold weather approaches, the dormouse rolls itself into a ball, and in this state is found in winter in holes of

trees and clefts of rocks; if kept in a warm room during winter, it continues active like ordinary animals; when the thermometer descends to about 48° F. it begins to grow torpid, and becomes entirely so at about 42°; according to the experiments of M. Mangili of Pavia, a temperature of 32°, or lower, revives the animal. When torpid, it appears as if dead, with the eyes closed, the breathing being suspended for a period of from 5 to 20 minutes, and then renewed for from 15 to 30 respirations, with a corresponding retardation of the circulation. The garden dormouse, or lerot (*M. quercinus*, Linn.), is smaller, with a thicker body, more pointed muzzle, and more thinly haired tail; the color is reddish gray above and white below, black round the eyes to the shoulders, tail black with a white tuft. This species lives in gardens, and sometimes enters houses; it often does mischief in orchards, always selecting the choicest fruit; it hibernates, eight or ten being sometimes found together rolled up in a magazine of food; the scent is like that of the rat, and the flesh is not used as food; it is confined to temperate Europe. The common dormouse (*muscardinus avellanarius*, Linn.) is not much larger than a mouse, but the head is shorter, the muzzle less pointed, and the eyes larger; the color above is a cinnamon red, and below whitish; the tail, as long as the body and flattened horizontally, is covered with hair, quite short, and arranged on each side like the barbs of a feather. This species inhabits the woods, hibernating in the clefts of trees, and is rarely found in gardens or houses. The name dormouse, or sleeping mouse, is best applied to this species, as it most readily falls into the lethargic state, from which it is aroused either by a too high or a too low temperature, becoming active in less than half an hour; when awakened, like the other species, it partakes moderately of food. It is found in temperate Europe, occasionally in England. The Cape dormouse (*graphiurus capensis*, F. Cuv.) is found in South Africa; the length is 7½ in. of which the tail is 3½; the color is bluish gray above and whitish below; the muzzle and spots above and behind the ear white, behind the chin rufous; tail bushy and penniform, grayish above and blackish below. —Dormice are kept as pets, and may be fed on all kinds of grain and nuts; the inner part of the cage should be stuffed with fine hay, and the whole kept very clean; in winter they should be kept in a warm room to prevent their going to sleep.

DORN, Heinrich Ludwig Edmund, a German composer, born in Königsberg, Nov. 14, 1804. He was leader of orchestras in that city, in Leipsic, and in Riga, till 1843, when he became director of a musical association in Cologne. Since 1849 he has been in Berlin as leader of the court orchestra. Among his works are the operas *Der Schöffe von Paris* and *Die Nibelungen*. In 1870 he published an autobiography, entitled *Aus meinem Leben*.

DORNBIRN, a town of Vorarlberg, Austria, 6 m. S. of Bregenz; pop. in 1870, 8,486. It has a flourishing industry, chiefly consisting of the construction of wooden houses, which are exported, and of manufactures of cotton goods and embroidery. It was formerly an imperial village.

DORNER, **Isaak August**, a German theologian, born near Tuttlingen, Württemberg, June 20, 1809. He is the son of a Lutheran clergyman, studied at Tübingen, and became a professor there in 1838. He removed in the following year to the university of Kiel, which he left very soon on his appointment as professor of divinity and councillor of the consistory at Königsberg. In 1847 he accepted a chair at Bonn, which he held till 1853, when he removed to Göttingen; and since 1862 he has been professor of systematic theology and exegesis at the university of Berlin. As a theological writer he is best known by his *Entwicklungsgeschichte der Lehre von der Person Christi* (Stuttgart, 1839; English translation by Dr. W. Simon, Edinburgh, 1859); and for his contributions to Herzog's *Encyclopädie für protestantische Theologie*, and to the *Jahrbücher für deutsche Theologie*, of which he is joint editor with Liebner and Ehrenfeuchter. Among his recent publications are *Geschichte der protestantischen Theologie* (Leipzig, 1867; translated into English, Edinburgh, 1871), and *Ueber die einheitliche Textgestaltung, beziehungsweise Verbesserung der lutherischen Uebersetzung des Neuen Testaments* (Stuttgart, 1868).

DOROG, the name of several towns of Hungary, the most important of which is situated in the circle beyond the Theiss, 20 m. N. N. W. of Debreczin, and belongs to the Hayduk district; pop. in 1870, 6,872. It is surrounded by marshy tracts of great fertility, but deficient in wood, and is an important market for grain, cattle, and horses. It contains a Greek non-united and a Roman Catholic parish church.

DOROGOBUZH, a town of Russia, capital of a district in the government and 55 m. E. N. E. of the city of Simolensk, on the Dnieper; pop. in 1867, 8,467. An encounter took place here, Oct. 27, 1812, between the rear guard of the retreating French and the Russians. The French partly burned the town.

DOROSMA, a town of Hungary, in the district of Little Cumania, 6 m. W. by N. of Szegedin; pop. in 1870, 9,688. It contains a Roman Catholic high school.

DORP, a town of Prussia, in the province of the Rhine, situated on the Wupper, 17 m. N. E. of Cologne; pop. in 1871, 10,690. It has considerable manufactures of tobacco, paper, steel, and hardware, and is growing rapidly.

DORPAT, **Dörpt**, or **Derpt**, a town of Russia, in Livonia, situated on the Embach, which is here crossed by a granite bridge, 163 m. S. W. of St. Petersburg; pop. in 1867, 20,780. It is on the road from Riga to St. Petersburg, and has two suburbs bearing the names of those

cities. It has a neat and picturesque appearance, being ranged in a semicircle, with clean, well paved streets, and a spacious market place. The most noteworthy of the public buildings is the university, founded in 1632, when the town belonged to Sweden, by Gustavus Adolphus, suppressed by the Russians in 1656, and reëstablished in 1802 by the emperor Alexander. Connected with it are a normal school called the *Professoren-Institut*, founded in 1828, and an observatory which the labors of Struve and other astronomers have rendered famous. The university has a library of about 80,000 volumes, a museum, and a botanical garden. It is in high repute, and students (600 to 700) resort to it from every part of the empire. The rector of the university is now appointed by the emperor; previous to 1851 he was selected by the professors from their own body. Dorpat also contains a gymnasium, founded in 1589, a number of other schools and academies, handsome law courts, and an ancient cathedral, now partly in ruins. The town was once fortified, but the defences have been dismantled and converted into pleasure gardens. It was founded in the 11th century, and anciently possessed great commercial importance, ranking as one of the Hanse towns. The Teutonic knights took it from the Russians in 1223, and erected it into a bishopric in 1224. This rendered it a place of considerable note, and for upward of three centuries the bishop exercised almost sovereign power within his diocese. The see was abolished in 1558, when the town passed again into the hands of the Russians. The Poles seized it in 1582, and the Swedes took it from them in 1625. Peter the Great recaptured it in 1704, and it has remained ever since in the possession of Russia. The vernacular is Esthonian, but the best educated classes speak German, which is also the language of the university and of the gymnasium.

DORSET, **Earls of**. See SACKVILLE.

DORSETSHIRE, a maritime county of England, on the British channel, and bordering on Devonshire, Somersetshire, Wilts, and Hants; length from E. to W. 57 m., greatest breadth 40 m.; area, 1,006 sq. m.; pop. in 1871, 195,544. The seacoast is very irregular, running out in several promontories, and broken by Poole harbor and Weymouth or Melcombe Regis bay. The chief rivers are the Stour, Frome, and Piddle. The face of the country is undulating, there being no mountains, and the highest point, Pillerden Pen, being only 934 ft. above the sea. A range of chalk downs, entering the country from Wiltshire on the N., passes S. W. and W. to the border of Somersetshire on the W., and is called the North downs; while a similar range, under the name of South downs, runs S. and S. E. from the W. terminus of the other, nearly parallel with the coast, to Poole harbor. The soil consists mainly of loose sand or gravel, interspersed with clay and chalk, and in some places mixed with them,

the conglomerate thus produced being the most fertile in the county. Besides the chalk formation, Dorsetshire contains pipe, plastic, and potters' clays, and has famous quarries of Portland stone, so called from the locality in which it is found, and which is exported to various parts of England, Ireland, and France. There are no ores nor coal. The downs are employed chiefly as sheep pastures. The Dorset sheep are noted as a profitable breed, and "Southdown mutton" has a high reputation. There is another and very small breed in the island of Purbeck, much prized by epicures. Excellent butter is made, but the cheese is of poor quality. The principal grain crops are wheat and barley. Potatoes, flax, and hemp are also raised. The manufactures comprise silk, woollens, cottons, blankets, canvas, ducks, fabrics of flax, gloves, parchment, buttons, beer, ale, and cider. Herrings, salmon, oysters, and large quantities of mackerel are taken off the coast. The chief towns are Dorchester, the county seat, Bridport, Lyme Regis, Weymouth, Poole, Shaftesbury, Wareham, and Sherborne.

DORSEY, John Syng, an American physician, born in Philadelphia, Dec. 23, 1783, died Nov. 12, 1818. He studied medicine with his relative Dr. Physick, received the degree of M. D. in 1802, visited France and England, and returned home in December, 1804. He was elected adjunct professor of surgery in the Philadelphia medical school in 1807, was transferred to the chair of materia medica, and having given two courses of lectures on that subject, was chosen to succeed Dr. Wistar as professor of anatomy. On the evening after delivering his introductory lecture he was attacked by a fever, and died at the end of a week, having gained at the age of 35 the reputation of one of the first surgeons of America. He contributed valuable papers to several periodicals, and published "Elements of Surgery" (2 vols. 8vo, 1813), adopted as a text book in the university of Edinburgh.

DORSIBRANCHIATES, a division of worms, swimming free in the sea, or living in the mud and sand, whose organs of respiration are in the form of tufts or branchial appendages arranged along the back or sides. The lob-worm (*arenicola piscatorum*), so much prized as bait in Europe, attains the size of the finger, and species of *evnice* have been found 4 ft. long.

DORT, or **Dordrecht** (Lat. *Dordræum*), an ancient town of the Netherlands, in the province of South Holland, situated on an island in the Merwede, a river formed by the junction of the Maas and the Waal, 11 m. S. E. of Rotterdam; pop. in 1870, 25,359. The advantages of its position, near the sea, accessible from the Rhine through the Waal, and having easy communication with an extensive inland district, have rendered it one of the first commercial towns of Holland. From Liège it receives coal, lime, and millstones. The vineyards on the Rhine supply it with wine, and from Switz-

erland and upper Germany it obtains timber, which drifts down the river in large rafts like floating islands, and is here collected. The surrounding waters afford plenty of good fish and wild fowl. A flourishing trade is carried on in oil, seeds, grain, flax, and stock fish. There are oil mills, saw mills, salt and sugar refineries, bleaching grounds, and factories of white lead, tobacco, steel pens, and window glass. The port is excellent. There are canals leading to the interior of the town, and a number of quays. The houses have an exceedingly antiquated appearance; the windows are grotesquely ornamented, and the gable ends generally face the street. Three old houses formerly used as rendezvous for armed burghers are still standing. In one of these, now used as a play house, was held the famous Protestant synod of Dort in 1618-'19, which condemned the doctrines of Arminius; and the provincial synods of South Holland were held in the same place until 1731, after which they convened in the great church. Another has been converted into a court house, and a public school is taught in the third. The chief church is St. Mary's, an immense building of great antiquity, now used by the Protestants, but originally by the Roman Catholics, and then containing 20 chapels and 40 altars. The pulpit is a fine piece of workmanship, of white marble elaborately sculptured. The town hall is very old, but in good preservation. Dort also has a corn exchange, a bank, an artillery arsenal, classical, agricultural, and other schools, an orphan asylum, almshouses, an infirmary, and a lunatic asylum. In 1421 it was involved in a terrible inundation, which is said to have swallowed up 70 villages, and to which the island of Dort owes its formation, the city having previously stood on the mainland. A conflagration in 1457 consumed upward of 2,000 houses, including many public edifices. The first meeting of the states general, at which the independence of the United Provinces was declared, was held here in 1572. While the disputes about the stadtholdership were raging in 1672, the inhabitants of this town sided with the house of Orange; in 1786-'7, when similar difficulties arose, and Prussia intervened, Dort took a decided stand against that kingdom, and succeeded in obtaining advantageous terms.

DORT, Synod of. See REFORMED PROTESTANT DUTCH CHURCH.

DORTMUND, a town of Prussia, in the province of Westphalia, 31 m. S. by W. of Münster; pop. in 1871, 44,454. It is enclosed by walls, has five gates, several churches, two hospitals, and some other public buildings, manufactories of woollen, linen, cotton, &c., four annual fairs, and a considerable trade. It was important at an early day, and was a member of the Hanseatic league, but its prosperity afterward declined. Formerly a free imperial city, it passed to the family of Nassau-Diez in 1802, and into the hands of Prussia in 1816.

DORUS-GRAS, Julie Aimée van Steenkiste, a French soprano singer, born in Valenciennes in 1813. She was engaged at the grand opera of Paris in 1830, and remained there upward of 20 years, when she retired with her husband M. Gras, a violinist. Her chief parts were in *Guillaume Tell*, *La muette de Portici*, *Fernand Cortez*, *Robert le Diable*, *Les Huguenots*, and *La Juive*. Her voice had great compass and flexibility, and she was distinguished by brilliancy of execution and dramatic delivery.

DORY, the name of a family of scomberoid fishes, distinguished from the others of the group by having protractile mouths. This family of *zeida* contains the six genera of *zeus* (Linn.), *capros* (Lacép.), *caprophonus* (Müll. and Trosch.), *lampris* (Risso), *equula* (Cuv.), and *mene* (Lacép.). The name of dory is generally restricted to the genus *zeus* (Linn.), characterized by one dorsal fin deeply notched, or two contiguous dorsals of which the anterior is spinous, with delicate filaments projecting far beyond the spines; the ventrals, also spiny, are a little in advance of the pectorals; there are two anals, or two divisions of a single anal,

John Dory (*Zeus faber*).

the anterior portion being spinous and the posterior soft, like the dorsals; the caudal is distinct and rounded at the end; there are several bony dermal bifurcated plates or shields along the basis of the dorsal and anal fins; the branchiostegal rays are seven; the teeth numerous, small, and feeble; the stomach large and caecal, with very numerous pyloric caeca; air bladder large, simple, and oval. The best known species is the common or John dory (*Z. faber*, Linn.), a fish attaining a length of over 2 ft., of a grotesque form, and a yellowish tint; the body is smooth, oval, and much compressed; the mouth is large, and capable of such protrusion that the length from the point of the lower jaw to the posterior angle of the operculum may be made as great as from this angle to the base of the tail; the teeth are in a single row; the eyes are large, lateral, high up on the head, and with yellow irides; behind and over each eye is a spine. The general color is olive brown tinged with yellow, with blue, white, and golden reflections rapidly varying; on each side, very near the middle of the oval, is a round black spot surrounded by a narrow light ring. This fish was well

known to the ancients, who expressed their regard for it by giving it the name of Jupiter. It has received a number of popular names, among others that of "St. Peter's fish;" with the haddock it disputes the honor of having been the species out of whose mouth this apostle took the tribute money, bearing on its sides, according to one popular tradition, the black spots indicating the marks of his finger and thumb; another tradition assigns the origin of these spots to the similar touch of St. Christopher as he bore the Saviour, wading through an arm of the sea. The name of dory has been derived from the French *adorée* (worshipped), and *dorée* (golden); the prefix of John has been derived from the French *jaune* (yellow). From the resemblance of the first dorsal fin to a cock's comb, it has been called sea chicken, *gal*, *gallo*, and in Gascony *jaru* (cock), to which also some have traced the epithet of John, the whole name meaning the "gilt cock of the sea." This species is found in the Mediterranean, along the western coast of Europe, at the Canary islands, and on the English and Irish coasts; in England it is most common on the coasts of Devonshire and Cornwall. Its forbidding appearance has prevented it from being so much prized as an article of food as it deserves; it was highly esteemed, however, by the ancient Romans, and is now a favorite in many parts of England. It is a deep-water fish, and feeds on the fry of other species, shrimps, and mollusks; the average weight in the London market is 3 or 4 lbs., but some from the bay of Biscay have been seen weighing 12 to 16 lbs. It often follows the pilchards, being very voracious, and is caught in the same nets with them; it readily takes the hook when baited with a living fish. In June, 1858, Dr. D. H. Storer described the first species of this genus found in American waters, in the "Proceedings of the Boston Society of Natural History" (vol. vi., p. 385); this is the spotted dory (*Z. ocellatus*, Storer), captured at Provincetown, Mass. The color is cupreous, marked with numerous dark circular spots; the base of the second dorsal is longer than that of the first; along the dorsal fin are seven bony spinous plates, along the anal five, along the abdomen eight, and along the throat four; the length was six inches.—The name of dory has been applied in this country to other scomberoid fishes of the genera *blepharis* (Cuv.), *argyreus* (Lacép.), and *vomer* (Cuv.); these were included by Linnæus and Bloch in the genus *zeus*, from which they were separated by Cuvier. These American dories have a very compressed body and very singular forms. In the genus *blepharis* the body is sharp on the edges, with a brilliant smooth skin; the dorsal and anal fins have filamentous rays from 4 to 12 in. in length, which from their resemblance to wax ends have obtained for them in the West Indies the name of *cordonniers* (shoemakers). In the genus *argyreus* the second and third rays, or only the first, of one or both

dorsals are filamentous; the great perpendicularity of the facial line gives a ridiculously solemn expression to this genus; these fishes are occasionally taken in the waters of New York, and are considered excellent food. The genus *vomer* has a similar vertical profile and silvery lustre, but no filaments or prolongations of the fins; it is esteemed for food; the *V. Brownii* (Val.) of the New York coast is from 8 to 12 in. long.

DOSITHEANS, an ancient sect of the Samaritans, so called from their founder Dositheus, who was a companion of Simon Magnus, and flourished in the 1st century A. D. According to one account, Dositheus was a disciple of John the Baptist, and, after the death of the latter, endeavored to place himself at the head of the followers of that prophet. Another account tells us that he tried to persuade the Samaritans to receive him as the Messiah. There were still in the 4th century a few Dositheans who adhered to their master as the true Messiah, but the sect was never important.

DOST MOHAMMED. See **AFGHANISTAN**.

DOTIS, or **Totis** (Hung. *Tata*), a town of Hungary, in the county and 12 m. S. E. of the town of Comorn, and 37 m. W. N. W. of Pesth; pop. in 1870, 9,855. It is in two parts, one on a hill, and the other on the shore of a little lake, separated by the ruins of a castle once the residence of King Matthias Corvinus. On the lake is the castle of Count Nicholas Esterházy, famous for its extensive wine vaults, in one of which is a tun of 34,700 gallons, which is generally full. The castle has a fine garden laid out in the English manner. There are several churches, a Piarist college with a gymnasium, a high school, and a military hospital. There are numerous mills and manufactories of woollens and stone ware, and a large market for sheep. Near the town are warm baths and mineral springs, valuable quarries, and Roman remains.

DOUAI, or **Donay**, a town of France, in the department of Le Nord, 18 m. S. of Lille; pop. in 1866, 24,105. It is situated on the river Scarpe, the canal de la Sensée, and the Northern railway. It is surrounded by walls, is strongly fortified, and contains several literary and scientific institutions, important educational establishments, among them a normal school, a public library, school of artillery, an arsenal and cannon foundry belonging to the government, and has manufactories of lace, embroidery, cotton, linen, leather, delft ware, glass, paper, refined sugar, salt, &c., several breweries, distilleries, and oil mills, and an extensive trade. Douai, according to some, existed under the Romans. It was important when in possession of the counts of Flanders, from whom it came into the power of the king of Spain, and in 1667 passed into the hands of Louis XIV. Taken by the duke of Marlborough in 1710, it was soon retaken by the French, and its possession was confirmed to them by the treaty of Utrecht in 1713. During

the religious troubles in England in the 16th and 17th centuries, it acquired considerable celebrity as the seat of a Roman Catholic college and ecclesiastical seminary, founded by Dr. William (afterward Cardinal) Allen, for the education of English youth. Studies were commenced at this institution in 1568, and for about ten years its prosperity was uninterrupted. But in course of time the townspeople of Douai, then subjects of the king of Spain, grew jealous of their English neighbors, and disturbances were frequent. To prevent further mischief the college was removed to Rheims in 1578, where it was protected by the Guise family. In 1593 it was again established at Douai, and remained there until broken up by the French revolution in 1793.

DOUARNENEZ, a town of France, in the department of Finistère, situated on a bay of the same name, 20 m. S. of Brest; pop. in 1866, 5,434. It has a considerable coasting trade and extensive fisheries.

DOUAY. **I.** Charles Abel, a French soldier, born in Besançon in 1809, killed at Weissenburg, Aug. 4, 1870. He was a graduate of the military academy of St. Cyr, served in Algeria and the Crimea, and distinguished himself in the attack on the Malakoff. He was promoted to the rank of brigadier general in 1855, and in 1859 to that of general of division for his brilliant services in the battle of Solferino. In the Franco-German war he commanded the second division of the first army corps, and was intrenched on the height of Weissenburg with two brigades and three batteries, where his forces were overwhelmed and scattered by the Germans under the crown prince Frederick William. He exposed himself to the fire of the enemy, and was struck by several bullets, his corpse being found on the battle field. **II.** Félix Charles, a French soldier, brother of the preceding, born in Besançon in 1818. He was at the siege of Rome as captain in 1849, and was lieutenant colonel in the Crimean war. After the battle of Magenta he became brigadier general, and he served as general of division under Forey in Mexico. In the Franco-German war he was commander-in-chief of the seventh army corps at Belfort, reinforced MacMahon at Châlons, and became a prisoner of war at Sedan. On his return to France he commanded the fourth army corps in the struggle with the commune, and on May 6 he occupied Boulogne, and engaged in protracted conflicts with Dombrowski's forces. He was the first to enter Paris by the gate of St. Cloud, May 21, saved the Louvre from being totally destroyed by the communists, and took possession (May 27) of Belleville. Subsequently he was placed in command of the military district of the Rhône, with his headquarters at Lyons.

DOUBLEDAY, Edward, an English naturalist, born in 1810, died in London in 1849. At an early age he made a tour of the United States, and on his return published a paper on the

"Natural History of North America," and was appointed one of the curators of the British museum. The most valuable of his contributions to science are the results of his researches concerning butterflies, published in a work "On the Genera of Diurnal Lepidoptera," which he left unfinished. He was also the author of a variety of papers on ornithology, entomology, and zoölogy, published in the "Entomological Magazine" and elsewhere.

DOUBLOON (Sp. *doblon*), a gold coin of Spain and Spanish America, originally valued at \$16. Its subdivisions in gold were the half doubloon, the quarter or *pistole*, the eighth or *escudo*, and in Spain the sixteenth or *reintén*. It is still coined in Mexico, Central America, and most of the South American states, but owing to a reduction of fineness is worth only from \$15 37 to \$15 61. (See COINS.)

DOUBS (anc. *Dubis*), a river of France, the largest affluent of the Saône, and forming part of the navigable canal between the Rhône and the Rhine. It rises in Mount Rixou, one of the summits of the Jura, 3,000 ft. high, and after a tortuous course through the department which bears its name, flows S. W. through that of Jura and part of Saône-et-Loire, and joins the Saône near the village of Verdun. Its total length is about 280 m. Strong currents impede the navigation; at various points it forms small lakes, and it has a cataract, the Saut du Doubs, about 100 ft. high. Among its affluents are the Dessoubre and the Savoureuse.

DOUBS, an E. department of France, in the old province of Franche-Comté, bordering on Switzerland and on the departments of Haut-Rhin, Haute-Saône, and Jura; area, 2,018 sq. m.; pop. in 1872, 291,251. Its surface gradually rises from the more level country in the N. W. to the rugged and sterile peaks of the Jura range. The principal rivers are the Doubs and the Oignon, which divides it from Haute-Saône, but there is a large number of smaller streams. Agriculture is carried on to some extent, but the grain raised is insufficient for the home consumption. Much attention is paid to the raising of horses and cattle, and a considerable portion of the department is devoted to pasturage. There are some iron mines, which are worked, and coal, gypsum, building stone, and salt are also produced. The manufactures comprise clocks, paper, leather, woollen and cotton cloth, iron and steel ware, butter, cheese, &c. The climate is somewhat variable, but on the whole is cold, and in the lower parts much rain falls. The country is nevertheless healthful, and the inhabitants are vigorous and sturdy. It is divided into the arrondissements of Besançon, Montbéliard, Baume-les-Dames, and Pontarlier. Capital, Besançon.

DOUCE, Francis, an English antiquary, born in 1762, died in London, March 30, 1834. He collected a great number of rare books, prints, medals, coins, &c., the most important of which he bequeathed at his death to the Bodleian

library. He gave his papers to the British museum, on condition that the box which contained them should not be opened until the year 1900. He contributed some papers to the "Archæologia" and to the "Gentleman's Magazine," and was the author of "Illustrations of Shakespeare and Ancient Manners" (2 vols. 8vo, London, 1807), and a "Dissertation on the Dance of Death" (London, 1834).

DOUGHERTY, a S. W. county of Georgia, intersected by Flint river; area, 300 sq. m.; pop. in 1870, 11,517, of whom 9,424 were colored. The surface is level; the soil fertile. The Southwestern railroad and the Albany branch of the Atlantic and Gulf line cross it. The chief productions in 1870 were 228,223 bushels of Indian corn, 12,365 of oats, and 14,034 bales of cotton. There were 1,860 mules and asses, 1,168 milch cows, 2,095 other cattle, and 3,422 swine; 2 machine shops, 1 manufactory of sashes, doors, and blinds, and 1 flour mill. Capital, Albany.

DOUGHTY, Thomas, an American landscape painter, born in Philadelphia, July 19, 1793, died in New York, July 24, 1856. He was apprenticed to a leather manufacturer, and afterward carried on the business on his own account. He had attempted painting in oil, and had received a quarter's tuition in India ink drawing, when a growing taste for art induced him in his 28th year, contrary to the advice of his friends, to become a painter. He practised his profession for many years in the United States, and also in London and Paris, acquiring a considerable reputation by his paintings of American scenery.

DOUGLAS, the name of eleven counties in the United States. **I.** A N. W. county of Georgia, formed since the census of 1870, bounded S. E. by the Chattahoochee river; area, about 300 sq. m. The surface is hilly, and the soil fertile. Grain and cotton are the staple products. Various minerals abound. Capital, Douglasville. **II.** An E. county of Illinois, intersected by Kaskaskia and Embarras rivers; area, 375 sq. m.; pop. in 1870, 13,484. The surface is level, and the soil fertile. The Chicago division of the Illinois Central railroad traverses it. The chief productions in 1870 were 73,144 bushels of wheat, 1,680,225 of Indian corn, 225,074 of oats, 65,265 of potatoes, 15,201 tons of hay, 29,406 lbs. of wool, and 198,283 of butter. There were 5,681 horses, 3,207 milch cows, 8,670 other cattle, 10,553 sheep, and 17,433 swine. Capital, Tuscola. **III.** The N. W. county of Wisconsin, bordering on Lake Superior and Minnesota; area, 1,500 sq. m.; pop. in 1870, 1,122. It is watered by several streams. The surface is hilly and generally covered with forests. The soil of the river bottoms is fertile. A ridge, called Mineral range, which contains copper, crosses it. The Lake Superior and Mississippi railroad skirts the N. W. corner. The value of farms in 1870 was \$66,760. Capital, Superior City. **IV.** A W. county of Minnesota; area, 720 sq.

m.; pop. in 1870, 4,239. The surface is dotted with numerous small lakes. The proposed St. Paul and Pacific railroad is to pass through the county. The chief productions in 1870 were 59,375 bushels of wheat, 65,568 of oats, 6,570 of Indian corn, 36,884 of potatoes, 10,708 tons of hay, and 90,574 lbs. of butter. The total value of live stock was \$168,758. Capital, Alexandria. **V.** A S. county of Missouri, drained by the N. fork of White river; area, 600 sq. m.; pop. in 1870, 3,915, of whom 27 were colored. The surface is hilly and in parts covered with forests. Lead has been found. The chief productions in 1870 were 13,794 bushels of wheat, 102,975 of Indian corn, and 18,050 of oats. There were 1,289 horses, 2,916 cattle, 2,805 sheep, and 7,676 swine. Capital, Vera Cruz. **VI.** An E. county of Nebraska, bounded E. by the Missouri river, which separates it from Iowa, and W. by the Platte, drained by Elkhorn, Big Papillon, and Little Papillon rivers; area, 350 sq. m.; pop. in 1870, 19,982. The surface is undulating prairie, and the soil fertile. Limestone is common, and water power abundant. The Union Pacific, the Omaha and Northwestern, and the Omaha and Southwestern railroads traverse it. The chief productions in 1870 were 84,545 bushels of wheat, 208,820 of Indian corn, 89,766 of oats, 44,899 of potatoes, and 11,381 tons of hay. There were 1,595 horses, 1,509 milch cows, 2,081 other cattle, and 2,827 swine; 5 manufactories of boots and shoes, 2 of bricks, 1 of carriages and wagons, 3 of confectionery, 1 of gas, 2 of iron castings, 10 of jewelry, 6 of saddlery and harness, 9 of tin, copper, and sheet-iron ware, 9 of cigars, 1 distillery, 5 breweries, 4 railroad repair shops, and 4 flour mills. Capital, Omaha. **VII.** An E. county of Kansas, bounded N. by Kansas river, and drained by the Waukarusa; area, 470 sq. m.; pop. in 1870, 20,592. It consists chiefly of rolling uplands, with a black loamy soil, well timbered. The minerals are coal and carboniferous limestone. The Leavenworth, Lawrence, and Galveston, and the Lawrence and Pleasant Hill railroads traverse it. The chief productions in 1870 were 65,042 bushels of wheat, 1,065,113 of Indian corn, 415,129 of oats, 193,983 of potatoes, 19,482 tons of hay, and 293,376 lbs. of butter. There were 6,614 horses, 6,656 milch cows, 9,665 other cattle, and 14,504 swine; 2 manufactories of agricultural implements, 2 of boots and shoes, 9 of carriages and wagons, 1 of iron castings, 5 of saddlery and harness, 5 of tin, copper, and sheet-iron ware, 2 of woollen goods, 4 saw mills, and 6 flour mills. Capital, Lawrence. **VIII.** A S. W. county of Oregon, bounded E. by the Cascade mountains, N. W. by the Pacific, and drained by the Umpqua river and its branches; area, 5,000 sq. m.; pop. in 1870, 6,066, of whom 76 were Chinese. The Rogne River mountains lie on the S. border. The valley of the Umpqua is fertile. Mines of gold, coal, and salt are worked, and quar-

ries of brown sandstone. The Oregon and California railroad is to pass through it. The chief productions in 1870 were 104,246 bushels of wheat, 26,956 of Indian corn, 188,761 of oats, 22,737 of barley, 24,250 of potatoes, 6,573 tons of hay, 75,583 lbs. of butter, and 321,643 of wool. There were 5,265 horses, 4,948 milch cows, 7,964 other cattle, 94,963 sheep, and 16,445 swine. Capital, Roseburg. **IX.** A W. county of Nevada, bounded on the S. W. and W. by California; area, 900 sq. m.; pop. in 1870, 1,215, of whom 23 were Chinese. It embraces the most fertile portion of the Carson river valley and the E. ridge of the Sierra Nevada mountains, and includes Hope valley and portions of Lake valley and Lake Bigler. The mountains are covered with pine forests. Water power is abundant on the streams. There are about 50,000 acres of arable land in the valleys. Mines of gold, silver, and copper exist, but they have not been profitably worked. The chief productions in 1870 were 12,781 bushels of wheat, 37,714 of oats, 40,331 of barley, 20,405 of potatoes, 7,758 tons of hay, and 43,870 lbs. of butter. There were 1,014 horses, and 2,619 cattle. Capital, Genoa. **X.** An E. county of Colorado, bordering on Kansas; area, about 4,500 sq. m.; pop. in 1870, 1,388. It is situated on the plains, and in the S. W. part, which takes in a portion of the "divide," pine timber is abundant. The elevation varies from 3,500 to 8,000 ft. It is watered by Plum, Cherry, Terrapin, Kiowa, and other creeks, tributaries of the Platte. The bottom lands are very fertile, but elsewhere the soil is best adapted to grazing, and only suitable for agriculture when irrigated. Coal and iron ore are found. The Kansas Pacific and the Denver and Rio Grande railroads traverse it. In 1874 Elbert co. was formed from the E. portion, reducing the above area. The chief productions in 1870 were 8,261 bushels of wheat, 5,050 of Indian corn, 22,891 of oats, 4,436 of barley, 7,271 of potatoes, 1,661 tons of hay, and 65,735 lbs. of butter. There were 9,611 cattle. Capital, Frankstown. **XI.** A S. E. county of Dakota; area, about 500 sq. m. It has been recently formed, and is not included in the census of 1870.

DOUGLAS. **I.** A seaport town and the capital of the Isle of Man, on the E. coast, at the junction of the rivers Dhoo and Glass; pop. in 1871, 13,972. It is a watering place of much resort, and has a harbor capable of admitting vessels of 10 or 12 ft. draught at high water, and a pier 520 ft. long. Steamers from Liverpool, Glasgow, and various ports of Ireland often touch here. Ship building is carried on to some extent, and many of the inhabitants are employed in the coasting trade and the fisheries. The old town is on the S. W. shore of the bay; the new is on terraces rising beyond. The most interesting buildings are Castle Mona (now converted into a hotel) and the "Tower of Refuge," which is on a dangerous rock in the bay. **II.** A village and parish

of Lanarkshire, Scotland, on a river of the same name, 7 m. S. by W. of Lanark; pop. of the parish about 2,500. The parish is owned almost entirely by the heir at law of the Douglas family, who takes from this place his title of baron. The duke of Hamilton is marquis of Douglas. Near the village are the ruins of the ancient church of St. Bride, noted for its numerous family tombs; also Douglas castle, the Castle Dangerous of Scott's novel, built in 1760 on the site of the ancient one, which had been destroyed by fire.

DOUGLAS, the name of one of the most ancient and powerful noble families of Scotland, descendants, according to one tradition, of a Fleming, Theobald, to whom Arnold, abbot of Kelso, made a grant of lands on the Douglas or Blackwater, in Lanarkshire, about the middle of the 12th century. According to another story, their progenitor was an unknown chief who, as a reward for success in battle, received lands in the same locality about 770. The best historians do not give credence to either of these legends, but pronounce it impossible to trace the authentic history of the race further back than William de Douglas, about 1175-1213. From him were descended, through Archibald, William and Andrew, successive heads of the house, Sir James Douglas of Loudon, and his cousin, "the good Sir James," who fought with Bruce at Bannockburn, and commanded a portion of the Scottish army. After Bruce's death he was intrusted with the duty of carrying the king's heart, as he had directed, to the Holy Land, and on his journey fell in a combat with the Saracens. From Sir James of Loudon was descended William de Douglas, lord of Liddesdale, called "the flower of chivalry," and from "the good Sir James" Sir William Douglas, knight of Liddesdale, called by Fordun "England's scourge." These two leaders were among the most famous feudal warriors of their time. Sir William, being a natural son, did not inherit the family estates, which passed to Hugh and Archibald, his uncles, through the latter of whom they descended to William, who was made earl of Douglas and lord justiciar of Lothian at the accession of King Robert II., in 1371. By marriage with a daughter of the earl of Mar he became earl of Douglas and Mar. His son James married the daughter of the king, but died without male issue, and the combined titles and estates were again divided, those of Mar going to his sister, and those of Douglas returning into the family of "the good Sir James" in the person of a second natural son, Archibald the Grim, who thus became third earl of Douglas. Meanwhile, George, a descendant of William, the first earl, and Margaret, sister of the third earl of Angus, had obtained in 1389 the earldom of Angus through his mother's resignation of her claim; and another of the family, a descendant of a younger brother of William, lord of Liddesdale, was in 1458 made earl of Morton; so that three

separate earldoms were held by the house of Douglas by the middle of the 15th century. The power of the family was so great in Scotland that a current proverb declared, "No man may touch a Douglas, nor a Douglas's man; for if he do, he is sure to come by the waur."—The two great-grandsons of Archibald the Grim, whose power had been greatly increased through the influence of their father (who had been one of the council of regency after the death of James I., and afterward lieutenant general of the realm), brought the main branch of the family to its highest point of distinction. Taking advantage of the infancy of the heir to the throne, and of the quarrels of the feudal nobles, they made themselves independent of all authority, assumed the state of kings, and for a long time practically maintained a kingdom of their own. Their ruin was effected through a series of political complications, and both were executed for treason in 1440, the earldom passing to a granduncle. By the latter's son William the power of the family was for a time restored, but he was also finally defeated in conflicts with the crown. He was murdered by James II. in 1452, leaving no issue; and with the final defeat of his brother James, after similar attempts to maintain a separate authority, this branch of the house of Douglas was overthrown. The earldom expired by forfeiture in 1455; and Earl James was compelled by James III. to become a monk, and died in the abbey of Lindores in April, 1488.—Meanwhile the Angus branch of the family, in the persons of the descendants of George, had remained loyal during these complicated conflicts, and had consequently increased in power with the waning influence of the older line. In 1455 George, fourth earl of Angus, was rewarded for his devotion to the royal cause by a grant of the old family estate of Douglas Dale, taken from the earl of Douglas. Dying in 1462, he was succeeded by his son Archibald, called "Bell-the-Cat" or "the Great Earl." He derived the former title from an exclamation which he made at a deliberation of the nobles regarding the best means of removing Cochrane, one of the king's favorites, who had become obnoxious. Lord Gray compared the meeting to that of the mice, who decided that the best plan to deliver themselves from the cat's tyranny was to hang a bell about her neck. On the question being raised as to who would dare to perform this feat, Douglas boldly replied, "I will bell the cat." He was warden of the east marches and lord high chancellor, an office which he resigned in 1498. He used his whole influence to dissuade the king (James IV.) from the invasion that ended in the battle of Flodden (1513); and, heart-broken at the results and at the loss of his own sons, two of whom fell in the battle, he retired to the priory at Whit-hern, in Galloway, where he died shortly after. One of his surviving sons, Sir Archibald Douglas of Kilspindie, sustained the family power

in protracted contentions with the Hamiltons, and after holding other offices was made lord treasurer in 1526 by James V.; while the title passed to the great earl's grandson, Archibald, sixth earl of Angus, who also took a prominent part in political affairs, and became lord high chancellor in 1527. He had married in 1514 the queen dowager of Scotland, Margaret, the sister of Henry VIII. of England, and by her became the father of Margaret, afterward wife of the earl of Lennox, mother of Lord Darnley, and grandmother of James VI. In the lawless state of Scotland at this time, Angus held his power by keeping the young king, James V., for a long time a positive prisoner, carrying on meanwhile a constant warfare with other powerful nobles of the kingdom (see JAMES V. of Scotland); but in 1528 James escaped, took affairs into his own hands with the greatest energy, and, turning upon the family that had so long oppressed him, made a vow that during his reign the Douglasses should "have no peace" in the kingdom. Angus was exiled, and sentence of forfeiture passed against him; he remained in England till James's death, after which he was restored to his title and estates. He died in 1556, and was followed by his son and grandson in regular succession; but on the latter's death without male issue the title passed to Sir William Douglas of Glenbervie, great-grandson of Archibald Bell-the-Cat. To him James VI. granted a charter confirming all the ancient rights of the family. He died in 1611, and the title from this time continued in the regular male line of descent, until William, 11th earl, was made marquis of Douglas in 1633. In 1703 the title duke of Douglas was created, but the head of the house, Archibald, dying childless in 1761, this latter became extinct, and the marquise passed to a relative, the duke of Hamilton. The next succession became a subject of litigation among several branches of the family; but in 1771 the house of lords gave judgment in favor of the son of Lady Jane Douglas, the duke's sister, as the rightful heir; and he was made a peer in 1790, under the title of Baron Douglas of Douglas castle, Lanarkshire, which became extinct at the death of his son James in 1857, when the Douglas estates passed to a niece, the countess of Home.—It has been said that a descendant of a younger brother of William of Liddesdale was made earl of Morton in 1458. This one of the family titles descended in due course for three generations; but the third earl died without male issue in 1553, and the earldom passed, to his son-in-law, James Douglas, famous as the regent Morton, and a descendant of Archibald Bell-the-Cat. (See MORTON, EARL OF.) After the execution of the regent in 1581 the Morton title passed to the Angus branch of the family, in the person of Archibald, eighth earl; but when he died without issue in 1588, it devolved upon Sir William Douglas, called "of Lochleven," a descendant of the

knight of Liddesdale's brother. The civil war compelled him to sell a large portion of the Douglas lands. What remained of his part of the family property descended with the title in due course to the present earl of Morton, who bears with it the titles attaching to two portions of the Douglas estates, viz., that of Baron Douglas of Lochleven (conferred on George, 18th earl of Morton, in 1791), and Lord Aberdour (created at the same time with the Morton earldom).—Other titles have been conferred at various periods on members of the main family, not mentioned in the history just given of the direct lines. Thus, in 1646, the title of earl of Selkirk was conferred on the third son of the first marquis of Douglas, and in 1651 the oldest son of that marquis was made earl of Ormond, and in 1661 earl of Forfar. In 1675 a fourth son of the same family was made earl of Dumbarton. In 1641 the title of Lord Mordington was conferred on the second son of the 10th earl of Angus. All these titles are now extinct or dormant excepting that of earl of Selkirk. The descendants of Sir William Douglas of Drumlanrig, an illegitimate son of the second earl of Douglas and Mar, form another important branch of the Douglas family. They were created successively viscounts of Drumlanrig (1628), earls of Queensberry (1633), marquises of Queensberry (1682), dukes of Queensberry (1684), earls of March (1697), and earls of Solway (1706). The title of duke of Queensberry passed, however, in 1810, to the duke of Buccleuch; the title of marquis of Queensberry is still borne by the lineal descendants of the family. In the Angus branch of the Douglas family certain privileges were vested, among them the right, in ancient times, to cast the first vote in parliament, to lead the vanguard in battle, and to bear the crown in public solemnities. The right to bear the Scottish crown in its coat of arms was retained by the family to the present century. The motto *Jamais arriere* probably commemorates these hereditary honors of the earls of Angus; while "the good Sir James Douglas" added to the armorial bearings the conspicuous device of the bloody heart, commemorative of the bequest of Robert Bruce. The Douglasses also bear upon their arms three stars (mullets), which is also a device of the Murrays, and lends a degree of probability to the theory of some genealogists, that the families descend from a common stock.—For the history of the Douglas family see especially "A History of the Houses of Douglas and Angus," by David Hume of Godscroft, first printed in folio, 1644, and reprinted in 1748. This work, though valuable to the antiquary, is not always historically accurate. See also vol. i. of Chalmers's "Caledonia" (London, 1807), and Robertson's *Origines Parochiales Scotiæ* (Edinburgh, 1851).

DOUGLAS, David, a British botanist, born in Scone, Scotland, in 1798, killed in the Hawaiian islands, July 12, 1834. He was employed

as a laborer in the Glasgow botanic garden, where his intelligence attracted the notice of Dr. (afterward Sir William) Hooker, who procured for him an appointment as botanical collector to the horticultural society of London. In this capacity he travelled extensively in America; in 1824 explored the Columbia river and California, and in 1827 traversed the continent from Fort Vancouver to Hudson bay, where he met Sir John Franklin, and returned with him to England. He made a second visit to the Columbia in 1829, and went to the Hawaiian islands. There he fell into a pit made for wild cattle, and was killed and mutilated by an animal previously entrapped. Through his agency 217 new species of plants were introduced into England. He collected 800 specimens of the California flora.

DOUGLAS, Gawin, or Gavin, a Scottish poet, bishop of Dunkeld, third son of Archibald, fifth earl of Angus (called "Bell-the-Cat"), born in Brechin about 1474, died in London in 1521 or 1522. He was educated for the church, partly in Scotland and partly at Paris, and when 22 years of age was appointed rector of Hawick. While in this office he made a translation of Ovid's "Remedy of Love," which has been lost. In 1501 he addressed to King James IV. the "Palace of Honor," an allegory whose structure so much resembles the "Pilgrim's Progress," that Bunyan has been thought to have borrowed his idea from it. About 1509 he was appointed provost of St. Giles's, Edinburgh. His translation of the *Æneid* into Scottish verse, made in 1512-'13, was first printed at London in 1553, with the following title: "The xiii. bukes of Eneados of the famous poet Virgill, translatet out of Latyne verses into Scottish metir, bi the Reuerend Father in God, Mayster Gawin Douglas, Bishop of Dunkel, & vnkil to the Erle of Angus: enery buke hauing hys peticular prologe." It is praised for its spirit and fidelity. The 13th book was the production of Mapheus Vegius. In September, 1513, Douglas accompanied the king to Flodden field, where his two elder brothers, the master of Angus and Sir William Douglas, with 200 gentlemen of their name, were slain. Soon afterward the earl his father died of grief. The chief of the house of Douglas was now the young earl of Angus, nephew of Gawin. This youth married the queen regent, and was the means of Gawin's obtaining the abbacy of Aberbrothwick, and a nomination to the archbishopric of St. Andrews, which would have made him head of the church in Scotland. The pope would not assent to this appointment, and as the partisans of the various candidates appealed to arms, it ended in Gawin's abbacy being taken from him. The queen made him bishop of Dunkeld in 1515, but on attempting to establish himself in his see he found it in armed possession of the earl of Athol's brother, Andrew Stewart. Douglas's friends rallied in force and took the cathedral, after which the contention went on for years

between the rival families of Angus and Hamilton, and in April, 1520, they met in Edinburgh to fight it out. Bishop Gawin, foreseeing bloodshed, endeavored to prevent the fray. But his intercessions were of no avail; the forces of the rival lords met, and Hamilton was defeated. The next year the regent Albany called the Angus party to account, and the earl, with Gawin and the chief men of his name, were forced to fly to England, where Henry VIII. received them well and allowed Gawin a pension. An allegorical poem of his, entitled "King Hart," was left in manuscript, and published by Pinkerton in his "Ancient Scottish Poems," 1788.

DOUGLAS, Sir Howard, an English general, born in Gosport, Hampshire, July 1, 1776, died at Tunbridge Wells in November, 1861. He entered the army at an early age, served in the Walcheren expedition, and in the Spanish and Portuguese campaigns of 1808-'12. He succeeded his brother as third baronet, May 24, 1809, and was governor of New Brunswick from 1823 to 1829, lord high commissioner of the Ionian Islands from 1835 to 1840, and member of parliament for Liverpool from 1842 to 1847. In 1851 he was raised to the rank of general. He was the author of several valuable works on military science, among which are an essay "On the Construction of Military Bridges," &c. (1816), "A Treatise on Naval Gunnery" (1819), and one on "Naval Evolutions" (1832). In a fourth edition of his "Naval Gunnery" (1855) he reviewed very severely the operations in the Crimea.

DOUGLAS, John, an English prelate, born in Pittenweem, Fifeshire, Scotland, in 1721, died in Salisbury, May 18, 1807. He was chaplain to a regiment of foot guards serving in Flanders, was present at the battle of Fontenoy (1745), and was employed by Gen. Campbell in carrying orders. Having held various benefices, he was chosen president of Sion college in 1781, made bishop of Carlisle in 1787, and dean of Windsor in 1788; and in 1791 he was translated to the see of Salisbury. He wrote "A Vindication of Milton from the charge of Plagiarism," and many religious and political pamphlets; and he superintended in 1762 the publication of the second Lord Clarendon's "Diary and Letters;" in 1777, Lord Hardwick's "Miscellaneous Papers," and Capt. Cook's second voyage; and in 1781, Capt. Cook's last voyage. His religious writings include anniversary sermons, and "The Criterion, or Miracles Examined," in reply to Hume.

DOUGLAS, Stephen Arnold, an American statesman, born at Brandon, Vt., April 23, 1813, died in Chicago, June 3, 1861. His father, who was a physician, died when Stephen was about two months old. The widow with her children retired to a farm, on which her son resided till he was 15 years old, when he determined to earn his own living, and engaged himself as an apprentice in cabinet making. After a year and a half his health became impaired

by hard work, and he abandoned the occupation. He then attended Brandon academy a year. His mother about this time married Mr. Granger of Ontario co., N. Y., and young Douglas removed with her to Canandaigua and entered the academy at that place. He studied law at the same time that he pursued his academical course, and in the spring of 1833 went to the west. At Jacksonville, Ill., he found his funds reduced to 37½ cents, and accordingly walked to Winchester, 16 miles, where he hoped to get employment as a teacher. He found there a large crowd assembled to attend an auction. The auctioneer was without a clerk, and perceiving that Douglas, who stood among the spectators, looked like a man who could keep accounts, requested him to serve in that capacity. He acted as clerk during the three days of the sale, and received \$6 for his services. With this capital he opened a school, and obtained 40 pupils, whom he taught for three months, devoting his evenings to the study of law, and on Saturday afternoons practising in petty cases. In March, 1834, he opened an office and began practice in the higher courts, having been admitted to the bar. He was remarkably successful, and within a year from his admission, while not yet 22 years of age, was elected by the legislature attorney general of the state. This office he resigned in December, 1835, in consequence of having been elected to the legislature. He took his seat in the house of representatives, the youngest member of that body. In 1837 he was appointed by President Van Buren register of the land office at Springfield, Ill., a post which he resigned in 1839. In November, 1837, he received the democratic nomination for congress, although he was under the requisite age of 25 years, which however he attained before the day of election in the following August. His congressional district was then the most populous in the United States, and the canvass was conducted with extraordinary zeal and energy. More than 36,000 votes were cast, and the whig candidate was declared elected by a majority of only five votes. After this defeat Douglas devoted himself exclusively to his profession till 1840, when he entered into the famous presidential campaign of that year with much ardor. In December, 1840, he was appointed secretary of state of Illinois. In the following February he was elected by the legislature a judge of the supreme court, which office he resigned in 1843 to accept the democratic nomination for congress. He was chosen by upward of 400 majority, and was reelected in 1844 and in 1846. But before taking his seat under the last election he was chosen to the senate of the United States for six years from March 4, 1847. In the house of representatives he was prominent among those who, in the Oregon controversy with Great Britain, maintained that our title to the whole of Oregon up to lat. 54° 40' was "clear and unquestionable." He declared that "he never would,

now or hereafter, yield up one inch of Oregon, either to Great Britain or any other government." He advocated the policy of giving notice to terminate the joint occupation; of establishing a territorial government over Oregon, protected by a sufficient military force; and of putting the country at once in a state of preparation, so that if war should result from the assertion of our just rights, we might drive "Great Britain and the last vestiges of royal authority from the continent of North America, and make the United States an ocean-bound republic." He was among the earliest advocates of the annexation of Texas, and after the treaty for that object had failed in the senate, he was one of those who introduced propositions, in the form of joint resolutions, as a substitute for it. As chairman of the committee on territories in 1846 he reported the joint resolution declaring Texas to be one of the United States of America, and he vigorously sustained the administration of President Polk in the prosecution of the war with Mexico, which was the ultimate consequence of that act. As chairman of the territorial committee, first in the house of representatives and afterward in the senate, he reported and carried through the bills to organize the territories of Minnesota, Oregon, New Mexico, Utah, Washington, Kansas, and Nebraska, and also the bills for the admission into the Union of the states of Iowa, Wisconsin, California, Minnesota, and Oregon. On the question of slavery in the territories he early took the position that congress should not interfere on the one side or the other, but that the people of each territory and state should be allowed to regulate their domestic institutions to suit themselves. In accordance with this principle he opposed the "Wilmot proviso" when first passed in the house of representatives in 1847, and afterward in the senate when offered as an amendment to the bill for the organization of the territory of Oregon. In August, 1848, however, he offered an amendment to the Oregon bill, extending the Missouri compromise line to the Pacific ocean, thus prohibiting slavery in all the territory north of the parallel of 36° 30', and by implication recognizing its existence south of that line. This amendment was adopted in the senate by a decided majority, receiving the support of every southern together with several northern senators, but was defeated in the house of representatives by nearly a sectional vote. The refusal of the senate to adopt the policy of congressional prohibition of slavery in all the territories, and the rejection in the house of representatives of the proposition to extend the Missouri compromise to the Pacific ocean, gave rise to the sectional agitation of 1849-50, which was temporarily quieted by the legislation known as the compromise measures of 1850. Mr. Douglas supported these measures; and on his return to his home in Chicago, finding them assailed with great violence, he de-

fended the whole series in a speech (Oct. 24, 1850) in which he defined the principles on which the compromise acts of 1850 were founded, and upon which he subsequently defended the Kansas-Nebraska bill in these words: "These measures are predicated on the great fundamental principle that every people ought to possess the right of framing and regulating their own internal concerns and domestic institutions in their own way. . . . These things are all confided by the constitution to each state to decide for itself, and I know of no reason why the same principle should not be extended to the territories." Mr. Douglas was an unsuccessful candidate before the democratic national convention at Baltimore in 1852 for the nomination for the presidency. On the 30th ballot he received 92 votes, the highest number given to any candidate on that ballot, out of a total of 288 votes. At the congressional session of 1853-'4 he reported the celebrated bill to organize the territories of Kansas and Nebraska, which effectually revolutionized political parties in the United States, and formed the issues upon which the democratic and republican parties became arrayed against each other. The passage of this bill caused great excitement in the free states of the Union, and Mr. Douglas as its author was widely and vehemently denounced, and in many places was hanged and burned in effigy. The whole controversy turned on the provision repealing the Missouri compromise, which he maintained was inconsistent with the principle of non-intervention by congress with slavery in states and territories. After repealing the Missouri restriction, the bill declared it to be the "true intent and meaning of the act, not to legislate slavery into any state or territory, nor to exclude it therefrom, but to leave the people thereof perfectly free to form and regulate their domestic institutions in their own way, subject only to the constitution of the United States." In 1856 he was again a candidate for the presidential nomination before the democratic convention at Cincinnati. The highest vote he received was on the 16th ballot, which stood for Buchanan 168, for Douglas 121, for Cass 6. In the congressional session of 1857-'8 he denounced and opposed the Lecompton constitution, on the ground that it was not the act of the people of Kansas, and did not embody their will. Before the adjournment of that session he returned home to vindicate his action before the people of Illinois in one of the most exciting and well contested political canvasses ever known in the United States, his antagonist on the stump being Abraham Lincoln, who was then the republican candidate for senator. The popular vote at the subsequent election was adverse to Mr. Douglas, but he succeeded in carrying the election of a sufficient number of state senators and representatives to secure his return to the United States senate by 54 votes for him to 46 for Lincoln.—Mr. Douglas was remarkably suc-

cessful in promoting the local interests of his own state during his congressional career. To him, more than to any other individual, is Illinois indebted for the magnificent grant of lands which secured the construction of the Illinois Central railroad, and contributed so much to restore the credit and develop the resources of the state. He was a warm supporter and advocate of a railroad from the Mississippi river to the Pacific ocean. In foreign policy he opposed the treaty with England limiting the Oregon territory to the 49th parallel, contending that England had no rights on that coast, and that the United States should never recognize her claim. He also opposed the ratification of the Clayton-Bulwer treaty, and endeavored to procure its rejection, on the ground, among others, that it pledged the faith of the United States for all time to come never to annex, colonize, or exercise dominion over any portion of Central America. He maintained that the isthmus routes must be kept open as highways to the American possessions on the Pacific, that the time would come when the United States would be compelled to occupy Central America, and that he would never pledge the faith of the republic not to do in the future in respect to this continent what its interests and safety might require. He also declared himself in favor of the acquisition of Cuba whenever the island could be obtained consistently with the laws of nations and the honor of the United States.—In 1860 he was the candidate of the northern section of the democratic party for the presidency, Mr. Breckinridge being supported by the southern section. Mr. Douglas received a popular vote of upward of 1,300,000, though he got only 12 electoral votes, while Mr. Lincoln, who was elected, got 180. In the stormy discussions in the senate at the beginning of the civil war Mr. Douglas took a prominent part in support of the government and the Union. In his speeches to the people after the adjournment of congress, he denounced secession as crime and madness, and declared that if the new system of resistance by the sword and bayonet to the result of the ballot box shall prevail in this country, "the history of the United States is already written in the history of Mexico." In a letter dictated for publication during his last illness, dated May 10, 1861, he said but one course was left to patriotic men, and that was to sustain the Union, the constitution, the government, and the flag, against all assailants. On his deathbed his last coherent words expressed an ardent wish for the honor and prosperity of his country and the defeat and dispersion of her enemies.—Mr. Douglas was a strongly built man, somewhat below the middle height, and hence was popularly known as "the little giant." He was a powerful speaker, and few Americans have surpassed him in personal influence over the mass of the people. He was married, April 7, 1847, to Martha, daughter of

Col. Robert Martin of Rockingham co., N. C., by whom he had three children, two of whom are living, and the eldest of whom, Robert Martin Douglas, is now (1873) private secretary to President Grant. She died Jan. 19, 1853. He was again married, Nov. 20, 1856, to Adèle, daughter of James Madison Cutts of Washington, D. C., who survived him, and is now the wife of Gen. Robert Williams, U. S. A. Senator Douglas's life, by James W. Sheahan, was published in 1860.

DOUGLASS, David Bates, an American engineer, born in Pompton, N. J., March 21, 1790, died in Geneva, N. Y., Oct. 19, 1849. He graduated at Yale college in 1813, entered the army as second lieutenant of engineers, and for his share in the defence of Fort Erie was made first lieutenant, with the brevet rank of captain. In 1815 he was appointed assistant professor of natural and experimental philosophy at West Point, in 1819 was astronomical surveyor of the boundary commission from Niagara to Detroit, and in the summer of 1820 accompanied Governor Cass in a similar capacity to the northwest. In August he became professor of mathematics at West Point, with the rank of major, and in 1823 professor of civil and military engineering. In this science he soon acquired a wide reputation. He was employed by the state of Pennsylvania during the summer recesses from 1826 to 1830 as a consulting engineer, and was charged with several of the more difficult parts in its system of public works. In 1831 he resigned his professorship and became chief engineer of the Morris canal. In 1832 he was appointed professor of civil architecture in the new university of the city of New York, and prepared the designs for its building. In June, 1833, he commenced his surveys for supplying New York with water, and in November submitted his first report, showing how to obtain a supply from the Croton river. In 1835, his plan having been accepted, he was elected chief engineer, and had accomplished the preliminary work when he was superseded. In 1839 he planned and laid out Greenwood cemetery. He was president of Kenyon college, Ohio, from 1841 to 1844, when he returned to the vicinity of New York. In 1845-'6 he laid out the cemetery at Albany, and in 1847 was employed in developing the landscape features of Staten Island. In 1848 he laid out the Protestant cemetery at Quebec, and was elected professor of mathematics and natural philosophy in Hobart college, Geneva, N. Y.

DOUGLASS, Frederick, an American orator and journalist, born at Tuckahoe, near Easton, Talbot co., Md., about 1817. His mother was a negro slave and his father a white man. He was reared as a slave on the plantation of Col. Edward Lloyd, until at the age of 10 he was sent to Baltimore to live with a relative of his master. He secretly taught himself to read and write, was employed in a ship yard, and, in accordance with a resolution long entertained,

fled from Baltimore and from slavery Sept. 3, 1838. He made his way to New York and thence to New Bedford, where he married and lived for two or three years, supporting himself by day labor on the wharves and in various workshops. In the summer of 1841 he attended an anti-slavery convention at Nantucket, and made a speech which was so well received that he was offered the agency of the Massachusetts anti-slavery society. In this capacity he travelled and lectured through Massachusetts and other New England states for four years. In 1845 he published an autobiography, and soon after its appearance he went to Europe and lectured on slavery to enthusiastic audiences in nearly all the large towns of England, Ireland, Scotland, and Wales. In 1846 his friends in England contributed £150 to have him regularly manumitted in due form of law. He remained two years in Great Britain, and in 1847 he began at Rochester, N. Y., the publication of "The North Star," whose title was changed to "Frederick Douglass's Paper," a weekly journal, which he continued for some years. In 1855 he rewrote and enlarged his autobiography, under the title of "My Bondage and my Freedom." His supposed implication in the John Brown raid in 1859 led Governor Wise of Virginia to make a requisition for his arrest upon the governor of Michigan, where he then was. In consequence of this Mr. Douglass went to England, and remained six or eight months. He then returned to Rochester, and continued the publication of his paper. When the civil war broke out in 1861 he urged upon President Lincoln the employment of colored troops and the proclamation of emancipation. In 1863, when permission was given to employ such troops, he assisted in procuring men to fill up regiments of them, especially the 54th and 55th Massachusetts. After the abolition of slavery he discontinued his paper and applied himself to the preparation and delivery of lectures before lyceums. In September, 1870, he became editor of the "New National Era" in Washington, which is continued under the care of his sons Lewis and Frederick. In 1871 he was appointed secretary to the commission to Santo Domingo; and on his return President Grant appointed him one of the territorial council of the District of Columbia. In 1872 he was elected presidential elector at large for the state of New York, and was appointed to carry the electoral vote of the state to Washington.

DOUR, a town of Belgium, in the province of Hainault, 9 m. S. W. of Mons; pop. in 1866, 8,501. It has large iron works and several bleaching grounds, and in the vicinity are coal and iron mines. Weaving and leather dressing are carried on to some extent.

DOURO, or **Duero**, one of the largest rivers of the Iberian peninsula, rises near Monte Urbi6n, on the northern frontier of the province of Soria in Spain, about 20 m. N. W. of the city of Soria. After following a southeasterly course for about 50 m. it makes an abrupt bend

and flows westward; this continues to be its general direction, in which it passes Aranda, Toro, Zamora, and Miranda, until it empties into the Atlantic at Oporto. Its current is rapid, and its course for the most part through narrow valleys. For about 50 miles it forms the boundary between Spain and Portugal. It is navigable for small vessels as far as the Spanish frontier, and receives the waters of the Pisuergra, Sequillo, Esla, Sabor, Tua, and Tamego from the north, and the Adaja, Tormes, Agueda, Coa, and Tavora from the south, besides many smaller streams. Navigation is often interrupted by freshets, and the river is but little used for commerce. On its banks are the vineyards which produce the celebrated wines of Oporto. Its length is estimated at 450 to 500 m.

DOUROCOULI (*nyctipithecus trivirgatus*), a small monkey found in Guiana and Brazil. In this genus the middle incisors are broad, and the canines moderate; eyes large; external ears not prominent beyond the fur; hind feet longest; tail longer than the body, not

Douroucouli.

prehensile. As its generic name implies, it is nocturnal, sleeping by day, but very active and fierce at night in search of insects and small birds. It is about 9 in. long, with a tail of 14 in.; the fur is soft, grayish white, with a brown line on the back, three dark stripes on the head, and yellowish brown below. It looks more like a cat than a monkey, and the mouth is surrounded by bristly white hairs. When seated it assumes the position of a dog, and when sleeping the head is bent forward between the feet; it is difficult to tame, and its voice is loud and disagreeable. Humboldt called it *aotes*, earless, though the ears are not particularly small. It lives in pairs, and resembles in appearance and habits the lemurs of the old world. F. Cuvier gave it the name of *nocthora*, from its nocturnal habits.

DOUVILLE, Jean Baptiste, a French traveller and naturalist, born at Hambie, Feb. 15, 1794, disappeared in the wilds of South America about 1833. He travelled in Europe, South America, and Asia, landing at Genoa on his return in 1824. In 1826 he went to Paris, where he was made member of the geographical society, and then sailed for Buenos Ayres. The river La

Plata was at that time under blockade by the Brazilians, and the French vessel was captured; but Douville was befriended by the Brazilian admiral, and sent to Buenos Ayres, where, finding his resources nearly exhausted, he attempted to replenish them by mercantile operations. Accused of some fraudulent transaction of which he was acquitted, he left Buenos Ayres in disgust, and went to Rio de Janeiro. On Oct. 15, 1827, he embarked for Congo, whence he returned to France in 1831. The stories of his discoveries in several kingdoms hitherto almost unknown to Europeans, and of his exploration of the Congo or Zaire and other rivers, aroused great enthusiasm among the Parisians. He received a medal from the geographical society; his researches were published under the title of *Voyage au Congo et dans l'Afrique équinoxiale* (4 vols., with a map, Paris, 1832), and his book and chart were used as the basis of subsequent maps of Africa. But the "Foreign Quarterly Review" assailed him as an impostor, and a few weeks later his deceptions were more fully exposed in the *Revue des Deux Mondes*. To cover his shame by real discoveries, he sailed for Brazil in 1833, and penetrated to the interior of South America by the Amazon, where, according to an uncertain report, he was killed.

DOUW, or **Dow, Gerard**, a Dutch painter, born in Leyden in 1613, died there in 1680. After receiving instruction in his early boyhood in drawing and in painting on glass, he became in 1628 a pupil of Rembrandt, under whom he studied for three years. He began with portrait painting, but was so extremely slow that no one would sit to him. He then painted domestic scenes. He was so exact in imitation, that a glass is needed to appreciate the skill and delicate finish of his work. His drawing was neither bold nor correct, but his figures are not wanting in life and expression, and his coloring is strong, fresh, and harmonious. He had none of the poetical taste of his master, for his pictures generally consist of two or three figures engaged in the most trivial and often disagreeable occupations, as many of their titles indicate. Among the most celebrated are the "Dropsical Woman," the "Village Grocer's Wife," the "Dentist," and the "Violin Player." His works are to be found in all the public galleries of Europe, but private fortunes could hardly command them, for it was Douw's rule to be paid for his pictures according to the time they cost him.

DOVE. See PIGEON.

DOVE, a river of England, rising on Axe Edge hill, near Buxton, in the N. W. part of Derbyshire, flowing S. and S. E. for about 40 m., and emptying into the Trent a short distance below Burton. For almost its entire course it forms the boundary between Derbyshire and Staffordshire. It is remarkable for the clearness of its water and the picturesqueness of its banks, especially in that part of its valley known as Dove Dale, where, near Ash-

bourne, it flows through a gorge of great beauty. The Dove frequently overflows, but generally with beneficial results to the land along its course. It is celebrated as a fishing stream, especially by Izaak Walton.

DOVE. I. **Heinrich Wilhelm**, a German physicist, born in Liegnitz, Prussian Silesia, Oct. 6, 1803. He was educated at Liegnitz, Breslau, and Berlin, in 1826 became a teacher and subsequently a professor extraordinary in the university of Königsberg, and in 1829 was invited to a similar chair in Berlin. In 1837 he was admitted to the academy of sciences, and in 1845 he became full professor of physics. He has investigated the laws which regulate atmospheric phenomena, and evolved them with clearness and precision. His reports and isothermal maps afforded the first representation of the isothermal lines of the whole globe for every month of the year, besides much kindred information, whose importance can scarcely be overestimated. He was the first to announce the presence of a secondary electric current in a metallic wire, at the moment that the circuit of the principal current is completed. Of his works, many of which have appeared in the transactions of the Berlin academy of sciences, and in Poggendorff's *Annalen*, the principal are: *Ueber Mass und Messen; Meteorologische Untersuchungen; Ueber die nicht-periodischen Aenderungen der Temperaturvertheilung auf der Oberfläche der Erde; Untersuchungen im Gebiete der Inductionselektricität; Temperaturtafeln; Monatsisothermen; and Das Gesetz der Stürme*, which has been translated into French and English. In a more popular style he has written several treatises on meteorological and electrical phenomena, which have found many readers. In the capacity of director of the Prussian observatories he publishes each year the results of their labors. Among his most recent writings are *Klimatologische Beiträge* (Berlin, 1857 *et seq.*), *Monats- und Jahresisothermen in der Polarprojectio* (1864), *Klimatologie von Norddeutschland* (1868-'71), and papers on electricity, the movement of water, &c. II. **Richard Wilhelm**, a German jurist, son of the preceding, born in Berlin, Feb. 27, 1833. On graduating at the university of Berlin in 1854 he delivered a thesis on ecclesiastical jurisdiction in Germany and France which attracted much attention. He served one year in the Prussian army, and in 1859 became a *Privatdocent* at Berlin, his lectures meeting with remarkable success. In 1860 he founded the *Zeitschrift für Kirchenrecht*, which he at first edited alone. In 1862 he was made extraordinary professor of ecclesiastical and German law at Tübingen, and in 1863 full professor. In 1865 he accepted a similar position at Kiel, and in 1868 at Göttingen. In 1869, when he was appointed by the king a member of the national synod, he earnestly opposed the efforts of the clerical delegates of the extreme Lutheran party to introduce, even in matters connected with the

church, obstacles to the union of Germany; and the same desire for unification inspired his action in more purely political contests, in which he engaged with much ability.—His services in this cause led to his election in 1871 to the first German Reichstag. He has published several essays in the *Zeitschrift für Kirchenrecht*, and he had charge of the revision of Richter's text book of ecclesiastical law.—His younger brother ALFRED edited the *Grenzboten* in 1869-'70, and since January, 1871, has been the editor of a similar politico-literary journal entitled *Im neuen Reich* (Leipsic).

DOVER (Fr. *Douvres*; anc. *Dubris*), a seaport (one of the cinque ports) of England, on the S. E. coast of the county of Kent, on the straits of Dover, in lat. $51^{\circ} 7' N.$, lon. $1^{\circ} 19' E.$, 62 m. S. E. of London (with which it is connected by the London, Chatham, and Dover, and the Southeastern railways), and 21 m. N. W. from the coast of France, to which it is the nearest English seaport; pop. in 1871, 28,270. The town is on a small bay, in a low interval formed between the lofty cliffs along the shore by the valley of a little stream call the Dour. The older portion is irregularly and rather poorly built, principally on one street, which runs parallel with the valley. The newer part faces the water; this includes many well built houses and several large hotels. There are about 20 places of worship, a theatre, museum, reading rooms, &c. The harbor consists of three basins, and though formerly possessing few advantages, it has during the past 20 years been so improved by the government, at immense cost, that it now forms a good anchorage for vessels of ordinary size. The entrance is sheltered by the admiralty pier, 1,700 ft. long, built of stone. The trade of the town is inconsiderable; ship building and rope manufacture are carried on, and there are some smaller industries; but its prosperity chiefly arises from the constant passage of travellers and freight to and from the continent, and the visits of those who come in summer for the bathing and sea air. Lines of steamers connect Dover with Calais, Ostend, and Boulogne. The submarine telegraph between England and the continent crosses the channel from Dover to Calais; it was completed in October, 1851. The castle of Dover, one of the most remarkable edifices in England, stands on the summit of a chalk cliff about $1\frac{1}{2}$ m. N. E. of the town. Its walls enclose 35 acres. It is supposed to have been founded by the Romans, but some portions are Norman and Saxon, while others belong to still later epochs. It contains a spacious keep, used as a magazine, and barracks for 2,000 men. Within the precincts of the castle stands an octagonal watch tower, interesting not only as the earliest specimen of Roman architecture, but also as one of the most ancient pieces of regular masonry in Great Britain.—In the neighborhood of Dover Cæsar made his first attempt to land on the British coast, but he was induced to change his point

Dover, England.

of debarkation by the abruptness of the shore and other difficulties. Under the Saxon kings it became a position of great importance in the defence of Kent. In the reign of Edward the Confessor it was made one of the cinque ports, and was looked upon as the key of the kingdom. After the establishment of the Norman rule it suffered from the vengeance of William

is connected with Boston and Portland by the Boston and Maine railroad, and with Lake Winnepiseogee by the Dover and Winnepiseogee railroad. A railroad to Portsmouth is in process of construction. The city is regularly laid out, and contains many elegant residences. The city hall is a commodious and substantial brick edifice. The high school building is one of the finest in the state. The Cocheco furnishes great motive power, the principal fall being 32½ ft. The supply of water is maintained through the dry season by draining Bow pond in the town of Strafford, about 15 m. W. N. W., which has been converted into an immense reservoir. Black river, in the S. part of the city, also furnishes water power. It has four large mills for the manufacture of print cloths, and extensive print works, which produce 31,000,000 yards annually, valued at \$3,410,000. The value of cotton goods manufactured annually is \$1,125,000; of woollen goods, \$380,000; of boots and shoes (1,200,000 pairs), \$1,800,000; of carriages, \$75,000; of lumber, \$28,000. There are also tanneries, brass and iron foundries, machine shops, manufactories of hats and caps, of sandpaper, of glue, and of oil cloth. In 1870 the capital invested in manufactures was \$2,031,000; males employed, 1,384; females, 972; value of products, \$7,130,000. There are three national banks, with an aggregate capital of \$320,000. The value of property is about \$6,000,000. The city is divided into four wards. There is a high school, and 3 grammar and 31 primary schools, employing 36 teachers, and having an average attendance of 1,270 pupils. The city library contains 4,500 volumes. There are three weekly newspapers, and eight churches.—Dover was settled in 1623, and is the oldest town in the state. It was attacked by Indians

Ancient Church and Pharos.

the Conqueror, to whom it had made strong opposition. In 1213 King John performed at Dover the ceremony of submission to the pope, giving up his authority to the papal nuncio. In 1295 the French made a descent upon the place, and committed great depredations.

DOVER, a city and the capital of Strafford co., New Hampshire, situated on both sides of the Cocheco river, about 2 m. from its confluence with the Piscataqua, and 12 m. from the ocean, 35 m. E. of Concord, and about 60 m. N. of Boston; pop. in 1870, 9,294. Small craft ascend at high tide to the falls of the Cocheco within the city limits, and improvements in the channel are in progress which will enable large vessels to reach the city. It

on the night of June 27, 1689, when 23 of the inhabitants were killed and 29 carried into captivity. A city charter was granted in 1855.

DOVER, a town of Morris co., New Jersey, on the Rockaway river and Morris canal, about 7 m. N. N. W. of Morristown and 32 m. W. by N. of New York; pop. about 2,000. It is on the Delaware, Lackawanna, and Western railroad, and is the terminus of the Chester branch. It is situated in a region abounding in fine natural scenery, but derives its chief importance from the iron mines of the vicinity, and from its iron manufactures. The town contains an extensive rolling mill, a planing mill, a sash, blind, and door factory, a steam saw mill, a carriage factory, a brass and iron foundry, a printing establishment, and machine and car shops. There are six churches, four hotels, a national and a state bank, two savings banks, and a newspaper.

DOVER, a town in the hundred of the same name, capital of Delaware, and seat of justice of Kent county, situated on St. Jones river and the Delaware railroad, 48 m. S. of Wilmington; pop. of the hundred in 1870, 6,394, of whom 1,839 were colored; of the town, 1,906, of whom 501 were colored. It is regularly built, mostly of brick, on high ground. The streets are wide, straight, well shaded, and cross each other at right angles. The principal public buildings face an open square, planted with elms, the E. side of which is occupied by a handsome state house. A new county court house and a new post office are in process of construction. The town contains a flour mill, two saw mills, a national and a state bank, an insurance company, two hotels, an academy, seven public and three private schools, a weekly newspaper, and six churches. Dover is the centre of the fruit-canning trade.

DOVER, a township of Tuscarawas co., Ohio, on the right bank of Tuscarawas river, near the mouth of Sugar creek, about 70 m. S. by E. of Cleveland; pop. in 1870, 3,515. The village of Canal Dover in this township (pop. 1,593) is regularly laid out on the W. side of the Ohio canal, across which and the river there is a bridge 346 ft. long. It is the shipping point for large quantities of wheat and flour. It contains mills, furnaces, and tanneries, and a woollen factory.

DOVER, Strait of (*Fr. Pas de Calais*; anc. *Fretum Gallicum*), a strait connecting the English channel with the North sea, and separating England from France. It extends from Dungeness and Cape Gris Nez N. E. to the South Foreland and Calais; length, 24 m.; breadth at Dover, where it is narrowest, 21 m.

DOVER'S POWDER, a preparation of ipecacuanha and opium, each a drachm, and of sulphate of potassa an ounce, rubbed together into a very fine powder. Though called by the name of Dr. Dover, it differs from that originally recommended by him, which contained also nitrate of potash and licorice. It is admirably adapted for promoting perspira-

tion, and possesses at the same time the properties of an anodyne. It is given after depletion, in cases requiring profuse diaphoresis, and is particularly used in dysentery, diarrhoea, and affections of the liver and of the bowels.

DOVREFELD (*Dan. Dovre Fjeld*), a mountain range of Norway, extending from the termination of the Langfield range, near lat. 62° N., to the beginning of the Kiölen range, about lat. 63°. Sneehætten, its principal peak, lat. 62° 20' N., lon. 9° 20' E., is one of the highest mountains of the Scandinavian peninsula (7,562 ft.), and its summit is always covered with snow. Four passes cross the Dovrefield range, the most frequented being on the E. side of the Sneehætten, on the road between Christiania and Dronheim. These mountains are granitic in character. In some of the highest gneiss predominates; in others mica schist. Red porphyry is found, which at a certain depth has the characteristics of syenite. Among the metals produced are iron, copper, and silver.

DOW, Lorenzo, an eccentric American preacher, born in Coventry, Conn., Oct. 16, 1777, died in Washington, D. C., Feb. 2, 1834. At an early age he was greatly distressed by religious speculations, until his acceptance of Methodist doctrines and his determination to become a preacher of that denomination, though his education was very limited. In 1796 he made an unsuccessful application for admission into the Connecticut conference; but two years later he was received, and in 1799 was appointed to the Cambridge circuit, New York. During the year he was transferred to Pittsfield, Mass., and afterward to Essex, Vt., but remained there only a brief time, as he believed he had a divine call to preach to the Catholics of Ireland. He made two visits to Ireland and England, in 1799 and 1805, and by his eccentric manners and attractive eloquence drew after him immense crowds, who sometimes indulged in a spirit of bitter persecution. He introduced camp meetings into England, and the controversy about them resulted in the organization of the Primitive Methodists. In 1802 he was preaching in the Albany district, N. Y., "against atheism, deism, Calvinism, and Universalism." He passed the years 1803 and 1804 in Alabama, delivering the first Protestant sermon within the bounds of that state. In 1807 he extended his labors into Louisiana, following the settlers to the extreme borders of civilization, and preaching to half-civilized throngs in the forest. After 1799 he had no official relation to the ministry of the Methodist church, but continued to adhere to and to preach the prominent doctrines of that communion till his death. During his latter years his efforts were more specially directed against the Jesuits, whom he regarded as dangerous enemies to pure religion and to republican government. Among his numerous writings are: "Polemical Works" (12mo, New York, 1814); "The Stranger in Charleston, or the Trial and

Confession of Lorenzo Dow" (Philadelphia, 1822); "A short Account of a long Travel, with Beauties of Wesley" (8vo, Philadelphia, 1823); and "History of a Cosmopolite, or the Writings of the Rev. Lorenzo Dow, containing his Experience and Travels in Europe and America up to near his fiftieth Year; also his Polemic Writings" (often reprinted).

DOWER (law Lat. *doarium*, or *douarium*; Fr. *douaire*), the estate which the wife has by operation of law in the property of her deceased husband. Strictly it applies only to what the law gives her independent of any act of the husband, and which, in fact, it is not in his power to bar. A marriage portion, therefore, whether given with the wife or secured to her use, and whether so given or secured by the father or other relative, or by the husband himself, is not dower; and yet the term by which such marriage portion was designated in the Roman law (*dos*) was used by Bracton and other English writers for the right of the widow in the lands of her deceased husband given to her by the common law, as well as the endowment in contemplation of marriage, which last was also called *donatio ante nuptias*. The English word dower expressed the former, and also the donation before marriage, which was in two modes, viz.: *ad ostium ecclesiæ* and *ex assensu partis*. Both of these were made at the porch of the church, after affiancing and before marriage; in the one, the husband endowed the wife of lands of which he was himself seized; in the other, with consent of his father, he endowed her of lands belonging to his father; and it was usual to specify the particular lands intended. Endowment at the church door was the common mode of providing for the wife in the time of Bracton (13th century), and no other could be substituted, as by will or any other conveyance; the object of which was to prevent fraud: *Non enim valent facta in lecto mortali, nec in camera, aut alibi ubi clandestina fuerunt conjugia*. The feudal restriction against alienation of lands was extended to dower, and the husband was not allowed to endow the wife *ad ostium ecclesiæ* of more than a third part of his lands. This gave rise to the common law rule which has ever since prevailed. In the absence of such dotation, or in case of the omission to specify the particular lands, it was prescribed that the wife should be entitled to one third of the lands of the husband for life if she survived him, which was called *dos rationabilis*. It was at first limited to the lands which the husband had at the time of the dotation, unless he specially charged his future acquisitions; and in case he had no lands, or not sufficient, he was permitted to endow his wife of personal property, which was held to be a bar against any claim to dower of lands thereafter acquired. But in Magna Charta it was provided that the wife should have for dower the third part of all the lands which the husband had held during his lifetime, unless she had been

endowed with less *ad ostium ecclesiæ*. In the reign of Henry IV. it was denied that the wife could be endowed of her husband's goods and chattels; and Littleton, who wrote in the reign of Edward IV., asserted that she could be endowed *ad ostium ecclesiæ* of more than a third part of the lands, and that she had the election after the husband's death to accept it or to take her dower at common law. In consequence of this uncertainty, that mode of endowment fell into disuse, but was never abolished until by act 3 and 4 William IV., c. 105 (1833). Dower at common law is different from the dotation of other countries, in being limited wholly to lands, and to such only as the husband holds in fee. By the civil law the *donatio ante nuptias* (or, as Justinian called it, *propter nuptias*) was all the provision made for the wife. It might consist of either lands or personal property; but though it went into the possession of the husband, it could not, if it consisted of lands, be alienated by him even with the consent of the wife, for which the reason given is the fragility of the female sex (*ne sexus muliebris fragilitas in perniciem substantiæ earum convertatur*). Upon the death of the husband, or dissolution of the marriage otherwise, the wife only took what had been given with her on the marriage, or that of which a donation had been made during the marriage. Of the other property of the husband she could take nothing either as widow or heir.—In France, the two modes of providing for the wife are designated by the discriminative terms *dot* and *douaire*; the former of which is defined to be that which the wife brings in marriage; the latter is the right which the wife has, by custom or matrimonial contract, to a certain portion of the estate of the husband upon his death. The origin of *douaire* was that in some provinces of France, called *France coutumière*, women were not endowed on marriage; and hence grew up the custom that the husband at his death should leave something for the support of the wife. What was so left was called either *dot* or *douaire*, the wife being said to be *douée* or *dotée*. But as it was intended for her support merely, it was provided that after her death it should go to the husband's children if he left any. Philip Augustus fixed the dower of the wife at one half of the goods which the husband had at the marriage. Henry II. of England established in his French provinces a rule that dower should be one third, and this difference continued to exist on the opposite sides of the Loire, until the customary law was swept away by the legislation which succeeded the revolution of 1789. By the present law of France married persons may, by stipulation made before marriage, become subject to the law of community, or to the law of dowry. If the former, it brings into common stock all the movables of which the parties are possessed at the time of marriage, and the immovables which shall be acquired during marriage.

Dower (*la dot*) is what the wife brings to the husband in marriage, and it may be either by donation from another or by a settlement of the wife upon herself, and it may extend to all the present or future property of the wife, but cannot be constituted or augmented during marriage. The parties may stipulate for a community of future acquisitions only. The husband has the management of dotal property, but is accountable as a usufructuary, and in case it be put in peril, the wife may obtain a separation of goods.—The English law of dower has recently undergone very great changes. By statute 3 and 4 William IV., c. 105, the widow is not entitled to dower of lands which the husband has disposed of in his lifetime, or by will. All charges by will, and all debts and encumbrances to which the estate of the husband is subject, take priority of dower; and dower is made subject to any restrictions which the husband may impose by will. But on the other hand, the wife is entitled to equitable dower of any beneficial interest of the husband which shall amount to an estate of inheritance in possession, except joint tenancy; and no gift of personal property by the husband can invalidate the right to dower, unless expressly so declared by will. This modification of the law of dower has probably grown out of the general custom prevailing in England among land proprietors of making marriage settlements. In cases where this is omitted, the wife still has some provision under the statute of distribution (29 Charles II.), which gives her one third of the personal estate of the husband when he dies intestate, not for life merely, but absolutely.—In the United States, the general rule prevails of allowing to the widow an estate for life in one third of all the lands of which the husband was seized in fee. To give the right, however, the seisin of the husband must be a beneficial one, and not merely as trustee or for the use of another, and the marriage must be legal, or if voidable, must not have been set aside during the husband's life. The wife may be barred of her dower in various modes; as: 1, by an old statute of Edward I., which has been recognized in some of the states and not in others, elopement from the husband, and living with an adulterer; 2, acceptance of a jointure or of a provision made by will in lieu thereof; 3, divorce, for in general the marriage must continue until the husband's death, though in some states it is provided that if divorce is had for the husband's misconduct, the wife shall be immediately endowed as if he were dead; 4, joining with the husband in a conveyance of the lands under the statute formalities. This last is the most usual mode, but if the conveyance be by way of mortgage, the wife shall have dower subject to the mortgage. Dower should be assigned to the widow by the husband's heir or alienee within the widow's quarantine, which originally was 40 days, but now by statutes is greatly enlarged, during

which she may continue to occupy the mansion house; but if he fail to do so, or make an assignment which she thinks unjust, she may recover by suit. The profits issuing out of lands are subject to dower, as well as the lands themselves, and assignment of dower in such cases is made by setting out one third the annual proceeds during the widow's life. The law of dower has recently undergone many changes in different states. In several the wife now has dower only in the lands of which the husband died seized; in others, though the husband's several conveyance does not bar dower, a judicial sale for the enforcement of a debt or a contract against him will do so; in others still the estate is enlarged and made an estate in fee, instead of for life only. The share which the widow takes in the personal property is not called dower, and there is no uniformity in the statutes on that subject.

DOWLER, Bennet, an American physician and physiologist, born in Ohio co., Va., April 16, 1797. He was educated at the university of Maryland, where in 1827 he received the degree of doctor of medicine. In 1836 he settled in New Orleans, and was for several years the editor of the "New Orleans Medical and Surgical Journal." From an early period in his career experiments upon the human body, immediately or very soon after death, occupied a large share of his attention, and the results of his investigations, comprising some important discoveries with regard to contractility, calorification, capillary circulation, &c., were published in 1843-'4. Since that time these and other original experiments have been extended, generalized, and analyzed by him. His researches on animal heat, in health, in disease, and after death, which have from time to time been published in medical journals, have led to important discoveries, particularly with reference to *post mortem* calorification, which his experiments have shown will, after death from fever, cholera, or sunstroke, &c., rise in some cases much higher than its antecedent maximum during the progress of the disease. In 1845 Dr. Dowler commenced a series of experiments in comparative physiology on the great saurian or alligator of Louisiana, which he regarded as better for the purpose than any of the cold-blooded animals usually selected for vivisection. From these experiments he was led to the conclusions that after decapitation the head, and more especially the trunk, afford evidences of possessing the faculties of sensation and volition for hours after a complete division of the animal; that the headless trunk, deprived of all the senses but that of touch, still retains the powers of perception and volition, and may act with intelligence in removing or avoiding an irritant; and that the functions and structures of the nervous system constitute a unity altogether inconsistent with the anatomical assumption of four distinct and separate sets of nerves, and a corresponding fourfold set of functions.

DOWLETABAD, or *Deoghir* (the fortunate city), a town and fortress of Hyderabad, Hindostan, about 7 m. N. W. of Aurungabad. The fortress is on a hill 500 ft. high, about 150 ft. of which is nearly perpendicular. The entrance

Dowlatabad.

is by a narrow passage cut through the rock. Notwithstanding its natural strength, the fortress has been taken several times, and has belonged to various masters. Near the town are the remarkable cave temples of Ellora.

DOWN, a N. E. county of Ireland, province of Ulster, bordering on the Irish sea and the counties Antrim and Armagh; area, 956 sq. m.; pop. in 1871, 277,775. Near the middle of the county is a group of hills, and in its S. W. part are the Mourne mountains, some of whose summits are among the highest peaks in N. Ireland; but with these exceptions the surface is generally level. There are several rivers, but only the Lurgan, which flows along the northern boundary, and the Bann, are important. All the streams and the lakes, which are numerous, abound in fish. Lough Strangford in the E. part is a large inlet of the sea, with which it communicates by a deep channel. The county contains many mineral springs, and is one of the best cultivated counties of Ireland, producing grain, peas, beans, potatoes, turnips, &c. Cattle, chiefly for dairy purposes, and hogs are reared in great numbers. There are extensive quarries of limestone, sandstone, and slate; and granite, coal, and chalk also occur. The most important manufacture is that of linen, though there are also cotton and woollen mills. The climate is healthy and somewhat cold, and the people generally are in better condition than those of most Irish counties. Fishing occupies many of the inhabitants. Some interesting and very ancient remains are found, and there are ruins of abbeys and castles of the middle ages. The chief towns are Downpatrick, the capital, and Newry.

DOWNES, John, an American naval officer, born in Canton, Mass., in 1786, died in Charlestown, Aug. 11, 1855. He entered the navy as a midshipman in June, 1802, and was in the frigate *New York* during the war with Tripoli.

In May, 1803, he distinguished himself in a boat attack upon some Tripolitan feluccas. In March, 1807, he was made lieutenant, and in the war of 1812 he served as executive officer of the frigate *Essex*, Capt. Porter, during her celebrated cruise in the Pacific. Among her numerous prizes was the whale ship *Georgiana*, which Capt. Porter fitted as a cruiser, with 16 guns, named the *Essex Junior*, and placed under the command of Lieut. Downes, who retained this position until the capture of the *Essex* and the

conversion of the *Essex Junior* into a cartel. In 1813 he was promoted to the rank of master commandant, and in 1815 he commanded the brig *Epervier* in the squadron employed against Algiers under Decatur. On June 17, 1815, the *Epervier* assisted in the capture of the Algerine frigate *Mashouda* off Cape de Gatt. Two days afterward the *Epervier* and three of the smaller vessels of the squadron captured the Algerine brig of war *Estido*, 22 guns and 180 men, off Cape Palos. After the conclusion of peace with Algiers, Decatur transferred Downes to his own ship, the *Guerriere*. In March, 1817, he became captain, and from 1819 to 1821 commanded the frigate *Macedonian* in the Pacific. In 1828-'9 he commanded the *Java* in the Mediterranean, and from 1832 to 1834 the squadron in the Pacific. On his way to his station he attacked (Feb. 6, 1832) and nearly destroyed *Quallah Batoo*, on the coast of Sumatra, where an outrage had been committed on an American vessel. His sea service terminated with his cruise. From 1837 to 1842, and from 1850 to 1852, he commanded the navy yard at Boston.

DOWNING, Andrew Jackson, an American landscape gardener, born in Newburgh, N. Y., Oct. 30, 1815, drowned in the Hudson river, near Yonkers, July 28, 1852. From an early age his tastes were directed to horticulture, botany, and the natural sciences, which the occupation of his father, a nurseryman, gave him many opportunities to cultivate. His school education was acquired chiefly at an academy in the neighboring town of Montgomery. He returned home at the age of 16 to assist an elder brother in the management

of the nursery, but continued a course of self-education which gave him a broad general culture. At the age of 20 he determined to become a rural architect, and began to visit the neighboring estates on the Hudson, to enlarge his experience and confirm his theories of landscape gardening. Three years later he erected on his estate an elegant mansion, which afforded the first practical illustration of the builder's conception of an American rural home. His career as an author properly begins with the publication in 1841 of his "Treatise on the Theory and Practice of Landscape Gardening." As a pioneer of its class in this country, it attracted attention, and the author's extensive information, correct taste, and appreciation of the conditions of rural architecture, gave it immediate popularity and a position as a standard authority, both in America and England. "Cottage Residences" (1842) was received with equal favor; and until his death Downing continued to be the chief American authority in rural art. In 1845 appeared simultaneously in London and New York his "Fruits and Fruit Trees of America;" and in 1846 he became editor of the "Horticulturist," published in Albany, for which he wrote an essay every month until the close of his life. In 1849 he wrote "Additional Notes and Hints to persons about building in this country," for an American reprint of Wightwick's "Hints to Young Architects," and in 1850 published his "Architecture for Country Houses." His remaining work was an edition of Mrs. Loudon's "Gardening for Ladies." The summer of 1850 he passed in England, chiefly among the great country seats, of which he wrote descriptions. On his return to America he received many private commissions, and was intrusted in 1851 with the laying out of the public grounds in the city of Washington, in the vicinity of the capitol, the president's house, and the Smithsonian institution. In the midst of these labors he took passage at Newburgh on July 28, 1852, in the steamboat Henry Clay, for New York. Near Yonkers the boat took fire, and he was drowned in endeavoring to reach the shore. A memoir of him by George W. Curtis, and a "Letter to his Friends," by Miss Bremer, who had been his guest during her visit to America, were prefixed to a collection of his contributions to the "Horticulturist," published in 1854, under the title of "Rural Essays."

DOWNPATRICK, a maritime town and parliamentary borough of Ireland, capital of county Down, situated a short distance from the mouth of the Quoyle in Lough Strangford, 21 m. S. S. E. of Belfast, with which it is connected by rail; pop. in 1871, 4,154. It is divided into English, Irish, and Scotch quarters, has a cathedral and the diocesan school of the Anglican diocese of Down, Roman Catholic, Presbyterian, and Methodist places of worship, a county court house, prison, infirmary, and fever hospital. Near the town is a

new lunatic asylum. A small export trade is carried on by means of vessels of 100 tons from Lough Strangford. It has manufactures of leather, linen, soap, and beer. The four holy wells of St. Patrick, to which pilgrims resort from all parts of Ireland, are near the town. Downpatrick is said to be the oldest city of Ireland, and was the chief residence of St. Patrick.

DOWSE, Thomas, an American book collector, born in Charlestown, Mass., Dec. 28, 1772, died in Cambridgeport, Nov. 4, 1856. He has sometimes been called "the literary leather dresser." His father, Eleazer Dowse, was a leather dresser, and was driven with his family from Charlestown on June 17, 1775, his house being one of those burned. He settled at Sherborn, Middlesex co., where Thomas spent his boyhood and youth. He had no other education than that of the town school. On attaining his majority he entered the service of a leather dresser at Roxbury, Mass., and remained in this employ ten years. He once informed a friend that at the age of 28 his highest income was \$25 a month; that he had never paid \$5 for conveyance from one place to another, never owned a pair of boots, and then possessed several hundred volumes of good books well bound. In 1803 he set up in business at Cambridgeport as a leather dresser, and pursued the occupation successfully till he was far advanced in life. From the earliest period he devoted a large part of his income to the purchase of books. By diligent search, great knowledge of bibliography, shrewdness, and strict economy in his purchases, he amassed a very remarkable library. It consisted of about 5,000 miscellaneous volumes, generally in good, often in elegant bindings, and of the best editions. It was mostly English, though containing translations of the principal authors in the ancient languages and the cultivated languages of modern Europe. It is estimated to have cost \$40,000. He bequeathed it to the Massachusetts historical society, who deposited it in a special room of their building in Boston. He also left \$10,000 as a permanent fund for the conservation and care of the library. A collection of admirable engravings and water-colors, which he drew in a lottery about 1820, was given to the Boston Athenæum.

DOXOLOGY (Gr. *δόξα*, glory, and *ἐξέγω*, to ascribe), in general, an ascription celebrating the grandeur and majesty of God. In the Roman Catholic church it is applied particularly to the angelic hymn or canticle of praise which is sung in celebrating the mass, and is otherwise called the *Gloria in excelsis*. This is also styled the greater doxology, to distinguish it from the lesser, or *Gloria Patri*, which is usually sung after the chanting or recitation of a psalm. Both doxologies are traced to the earliest periods of the church, and, though slightly and temporarily modified during the prevalence of some heresies, have not been permanently changed. They both have a place in

the liturgy of the Anglican church, and are of common use in the service of other branches of Protestantism.

DOYLE, Richard, an English artist, born in London in 1826. From his father, John Doyle, an able political caricaturist, he inherited a taste for humorous illustration, and a few years after the establishment of "Punch" became known to the public by his designs published in that paper. His political caricatures are singularly free from direct personalities, but his humorous illustrations of London life afford the best examples of his harmless wit and graceful fancy. The series entitled "Manners and Customs of y^e Englyshe," though ostensibly caricatures, are in fact sketches of the everyday life of the people. The "Continental Tour of Messrs. Brown, Jones, and Robinson" is a somewhat exaggerated view of the lights and shadows of travel on the continent. In 1850, taking umbrage at the very severe attacks of "Punch" upon the Roman Catholic hierarchy, Doyle severed his connection with that paper, since which time he has employed his pencil chiefly in illustrating books of fairy tales and similar publications, including "The Fairy Ring," "Fairy Tales from all Nations," Leigh Hunt's "Jar of Honey," Ruskin's "King of the Golden River," &c. He also illustrated "The Newcomes" of Thackeray. In 1869 he published a Christmas book entitled "In Fairy Land: Pictures from the Elf World."

DOZY, Reinhart, a Dutch orientalist and historian, of French extraction, born in Leyden, Feb. 21, 1820. He studied in Leyden, where he graduated in 1844, and has been since 1850 professor of history. His principal works are: *Recherches sur l'histoire et la littérature d'Espagne pendant le moyen-âge* (2 vols., Leyden, 2d ed., 1860), in which he exposed the falsifications of the monkish chroniclers; *Al-Mukkarri* (with Dugas, Krehl, and Wright, 2 vols., 1855-'61); *Histoire des Musulmans d'Espagne jusqu'à la conquête de l'Andalousie par les Almoravides* (4 vols., 1861); *Het Islamismus* (Haarlem, 1863); and *Scriptorum Arabum Loca de Abbaditis* (3 vols., Leyden, 1846-'63).

DRACHENFELS (Dragon's Rock), the most celebrated of the Siebengebirge range or "seven hills" (though their number is really greater), on the right bank of the Rhine, near Bonn. The ascent of the steep mountain, which is about 1,050 ft. high, amply rewards

the traveller by the beauty of the scenery of the river and valley and of the adjoining panorama of ruin-clad mountains. On the summit of the Drachenfels are the ruins of a castle of the 12th century, and two monuments of the services of the Siebengebirge militia in the struggle of 1813-'15. Here also is a quarry which has furnished stone for the cathedral of Cologne, and hence called *Dombruch* (cathedral quarry).

Ruins on the Drachenfels.

The beauty of this mountain has been a fruitful theme with poets of every land. Its name is explained by a tradition of a dragon which inhabited a cavern in its sides, and was slain by Siegfried, the hero of the Nibelungen lay.

DRACHMA, a measure both of weight and value among the ancient Greeks. In either case it was composed of 6 oboli, and was the $\frac{1}{100}$ part of the mina, and the $\frac{1}{600}$ part of the Attic tal-

Athenian Drachma (exact size).

ent. The drachma was the principal silver coin of the Greeks, and its value was from 15.20 to 17.05 cents. The drachma or drachm mentioned by Jewish writers was the Greek coin, which became current among the Jews in the latest period of their national existence.

DRACO, the author of the *Θεσμοί*, the first written code of laws at Athens, which he is supposed to have published in the 39th Olympiad (beginning 624 B. C.). Almost nothing is known of his life, but he appears to have been of distinguished birth and virtue, honored for his severe manners and his large experience in public affairs. The exact incidents

which led to the formation and adoption of his code are unknown. It is the opinion of most writers that he framed it in accordance with a spontaneous demand of the people, who were weary of lawlessness. He took the citizen at the moment of his birth, prescribed the manner in which he should be nourished and educated, and followed him with directions through the epochs of life. The penalty of death was to be inflicted for almost every crime. The slightest offence, he said, deserved death, and he knew no punishment more severe for the greatest. He carried his severity to a fantastic extreme, ordering punishment to be inflicted upon a statue whose fall had injured a man. So violent a code could not last, and within 30 years Athens was again in anarchy. Draco died at the culmination of his glory, upon the isle of Ægina. Suidas says that as he entered the theatre there and received the acclamations of the people, he was stifled amid the mass of caps, robes, and cloaks, which in accordance with custom they threw upon him as a mark of honor.

DRACUT, a town of Middlesex co., Mass., on the N. bank of Merrimack river, opposite Lowell, with which it is connected by two bridges; pop. in 1870, 2,078. It borders on New Hampshire, and is traversed by Beaver river, which supplies it with water power. It is mainly an agricultural town, but contains two woollen mills, one of which has 19 sets of cards, 82 looms, and a capital of \$500,000. There is also a paper mill.

DRAGOMAN, an oriental word signifying interpreter. It is applied, in the Ottoman empire and the courts of the further East and of Barbary, to men who know several languages, and act as interpreters between foreigners and the natives. What was formerly a necessity for commercial relations, has since become so for purposes of diplomacy. At Constantinople the office of prime dragoman, through whom the sultan receives the communications of Christian ambassadors, is one of the most important of the Sublime Porte. Dragomans are also attached to each of the foreign legations at oriental courts, and as such they enjoy the privileges of diplomatic officers. The French government trains a number of young men to fill these positions.

DRAGON, an animal often alluded to in the Bible, supposed by some to be the crocodile, and by others to refer in some passages to a species of giant serpent, or to a wild beast like the jackal or wolf. According to Robinson's Calmet, it is not improbable that St. John had in mind the enormous boa of Africa and the East when he described the symbolic great red dragon.—In mythology, the dragon is a fantastic animal, variously represented as of immense size, with wings, thorny crests, powerful claws, and a snaky tail and motion. He figured in the ancient conceptions of the Orient and of the classical nations, was a familiar subject in the middle ages, is still an emblem of universal

use among the Chinese, and seems to have existed almost everywhere except in nature. The pterodactyl and ramphorhynchus of the mesozoic age, though probably extinct long before the era of man, would have furnished excellent foundations for the dragon of tradition.

DRAGON (*draco*, Linn.), an iguanian lizard of the subfamily of acrodonts, or those having the teeth implanted in the bony substance of the jaws, to which they firmly adhere by the base of the roots. The head is triangular, flattened, and covered with small irregular scales, sometimes ridged; the small circular and tubular nostrils open at the end of the obtuse snout; the tongue is thick and spongy, with a round single extremity; the anterior teeth are three or four, and resemble incisors; behind these the median ones are conical, like canines, and there are generally two pairs in each jaw; the posterior teeth, or molars, are tricuspid and compressed; under the neck is a long dewlap, and on each side a triangular cutaneous fold placed horizontally, all three having in their thickness a process from the hyoid bone; there is generally a small cervical crest.

Draco fimbriatus.

While some species have no external ear, in others there is a small circular membranous tympanum. The neck is slightly compressed; the body has a central dorsal depression, and is covered above and below with small imbricated ridged scales. Dragons are at once distinguished from all other reptiles of this order by the horizontal expansion of the skin of the sides into a kind of wing, supported chiefly by the first six false ribs, which are extended horizontally outward. This flying membrane is semicircular, about as wide as the arm is long, free in front, but attached behind to the interior part of the thigh; in a state of rest the animal keeps it folded like a fan along the body, and when leaping from branch to branch spreads it like a parachute to sustain it; it cannot be moved as an active organ of flight, like the wing of a bird or the membrane of the bat. The fore and hind limbs, each with five toes, are of about the same length, the latter being flattened, with the posterior border fringed with serrated scales; there are no femoral pores; the tail is very long, slender,

wide and flat at the base, round at the end, with rhomboidal imbricated scales, strongly ridged beneath. Among the species with a visible tympanum, and the nasal openings directed laterally, are: 1. The fringed dragon (*D. fimbriatus*, Kuhl), with the thighs fringed behind with triangular scales, and with longitudinal white lines on the wings; the general color above is an olive gray with shades of brown in transverse bands, and whitish below; this is the largest species described by Duméril and Bibron, the total length being about 11 in., of which the body is only 3; it is peculiar to Java. 2. The flying dragon (*D. Daudinii*, Dum.), from Java, grayish above with black spots, and the wings marbled with the same; total length about 9 in. Several other species are described from the East Indies. There are two species which have the tympanum concealed under the skin, constituting the genus *dracunculus* of Wiegmann; these are the lined dragon (*D. lineatus*, Daudin) of Amboyna and Celebes, about 6½ in. long, with the back ash-colored, and the wings grayish brown with longitudinal white lines; and the Philippine dragon (*D. spilopterus*, Wiegmann), from the neighborhood of Manila, about 8½ in. long, with red wings spotted with black or brown, and throat yellow with black dots. Dragons live almost entirely in trees and feed upon insects, which they catch with great dexterity.

DRAGONETTI, Domenico, an Italian contrabassist, born in Venice, April 7, 1763, died in London in 1846. His father was a player upon the double bass, and the young Dragonetti made such progress upon the instrument as to be regarded as a prodigy at the age of 13. He was the first to make a solo instrument of the unwieldy double bass. At the age of 24 he took up his residence in London, where he remained during the rest of his life as first double bass in the royal theatre and at the philharmonic concerts. He was esteemed the most accomplished player upon his instrument of his time, and wrote for it many pieces in which were introduced passages that hitherto had been deemed practicable only for the violin. The instruments that he played were a superb Gasparo da Salo and a Stradivarius.

DRAGON FLY (*libellula*, Linn.), an insect of the family *subulicorne*s of Latreille, or *odonata* (Fabr.), and the order *neuroptera*. The insects of this genus, called in this country "devil's darning needles," in the perfect form are light and graceful fliers, of the most brilliant and beautiful colors, with four large, shining, delicate wings of nearly equal size; the mouth is provided with strong horny mandibles and spiny maxillæ; the eyes are lateral, large, and brilliant, with three stemmata on the top of the head; the antennæ consist of from three to six joints; the legs are short, six in number, directed forward, arising from a firm thorax of three united segments; the abdomen is very long, a flattened cylinder, soft, without sting

or piercer, and in the males terminated by two lamellar appendages. In some genera the male sexual organs are placed in the second abdominal ring, and those of the female in the last ring; the female deposits her eggs on aquatic plants beneath the surface of the water. From their lightness and beauty the French call them *demoiselles*. They are among the most voracious and cruel of insects, darting with swiftness and ferocity upon gnats, mosquitoes, butterflies, and almost any soft-bodied winged insect, eating even their own species. They are in no way injurious to man, but are directly beneficial in destroying many noxious insects. They hover over pools in search of prey, or dart from a post or fence upon insects coming near. They are equally carnivorous in the larva state, which they pass in the water. The larvæ have six feet, and a very complicated arrangement of the parts forming the under lip, which covers the face like a mask, concealing the mouth; they crawl stealthily along the bottom, and spring their jointed mask upon insects and even small fishes with great precision. By a valvular apparatus at the end of the tail, they draw in and expel water, as a means of locomotion. They remain several months in the water, and change their skins several times. The nymphs have rudimentary wings, and when they are ready to assume their final change the brilliant eyes of the future fly may be seen through the envelope; they crawl out of the water upon some bank or aquatic plant, where the pupa skin becomes dry and crisp and bursts open on the back. During the drying of the wings the insect bends the body into a crescent, that the delicate tissue may not be disturbed by contact with any foreign substance. The anterior nervures of the wings must be very strong, though light, to permit the rapid vibrations of these organs; their section, as in the butterfly, presents the form found by engineers to be that of the beam of greatest strength and lightness, viz.: the greatest amount of material thrown into the oval

Libellula trimaculata.

flanges, connected by the thinnest possible median support. According to Drury, these insects are two years in reaching the perfect form from the egg; after flying about a few

weeks, and having performed the act of reproduction, the wings become ragged, the strength fails, and they soon die. M. Poey says that at certain seasons the north winds sweep hosts of them into the neighborhood of Havana; in Belgium in 1854 a swarm was seen extending three quarters of a mile, the lowest individuals flying at a height of about six feet.—The restricted genus *libellula*, of which nearly 20 species inhabit New England, has a flattened, moderately long body, an almost globular head, the eyes contiguous or approximate, and the wings horizontal when at rest. The larvæ are short and thick, rough and of a dirty color; they have five appendages to the tail. The genus *ashna* (Fab.) includes the large species, with long slender bodies, which keep the wings expanded when at rest; the larvæ are larger, long and slender, with the abdomen flat below and rounded above; this includes the *L. grandis* (Linn.), the largest and most predaceous of the British genera; there are about a dozen species in Massachusetts. In the genus *agrion* (Fab.) the

Agrion.

wings are perpendicular during repose, the head transversal, and the eyes far apart; this includes the species with the slender and filiform abdomen, sometimes of extraordinary length; the larvæ are small, with round slender bodies terminating in three feathery appendages; there are about ten northern species well known, many of them delicate and beautiful; among the foreign species are some of the most brilliant of insects. Many of the finest American species of this family are described and figured by Drury.

DRAGON'S BLOOD, a resinous substance obtained from the fruits of several small palms in the East Indies, from the trunk of *dracana draco*, a large tree growing in the Canary Islands and Azores, and from *pteroocarpus draco*, a tree of the West Indies and South America. It occurs in oval masses, sticks, and disks. It is inodorous and tasteless, insoluble in water, but soluble in alcohol, ether, and the volatile and fixed oils, with which it forms red solutions. It was formerly employed in medicine as an astringent, but is nearly or quite inert. It is sometimes used to impart color to plasters,

but is valued chiefly as an ingredient of paints and varnishes.

DRAGUIGNAN, a town of France, capital of the department of Var, 41 m. N. E. of Toulon; pop. in 1869, 9,819. It lies in a fertile valley, surrounded by high hills covered with rich vineyards, and is well built, with several elegant edifices and numerous fountains. It contains a library of about 20,000 volumes, a cabinet of medals and of natural history, law courts, a botanic garden, a communal college, and a fine clock tower. The inhabitants are employed chiefly in the silk mills and soap works of the environs, and in preparing and selling olive oil. Draguignan was founded in the 5th century. It suffered greatly in the religious wars of the 16th and 17th centuries.

DRAINAGE, the art of freeing land from superfluous water by causing it to flow off in channels or through porous substances. The system of drainage adopted for cities and towns will be treated in the article **SEWERAGE**. The art is of especial interest in its application to the reclaiming of wet lands, and the improvement of those through which water does not find a ready exit. The ancient Romans constructed open drains for conveying the superficial water from their lands. In England, public attention was directed to the injurious effects of water retained in cultivated lands by the treatise of Capt. Walter Blyth in 1652. The author condemned the shallow open drains in common use, and recommended straight trenches reaching below the spring of "cold, spewing, moist water," which he regarded as the source of the "corruption that feeds and nourisheth the rush or flagg," even to the depth of three or four feet, and the filling in of the trenches with stones, or fagots covered with turf. It was long before the excellence of this system was generally recognized, and little attention appears to have been directed to it until the latter part of the next century. About the year 1764 a farmer of Warwickshire, Mr. Elkington, discovered that when an impervious stratum beneath the soil was perforated, the water welled up and flowed away; and he hence inferred that the water in wet lands came chiefly from subterranean sources, and might be removed by tapping the stratum that confined it. On this theory he established an original system of drainage, and was remarkably successful in seeking out the sources of the water, which, after reaching by an auger, he drew off in a single deep channel. This system came into extensive practice in England and Scotland, and its imperfections were not fully appreciated till after the introduction of the system of James Smith of Deanston, in 1823. This was contrived with reference to the removal of the water on the surface, as well as that beneath the soil, and was in fact the practice recommended nearly 200 years before by Capt. Blyth. A series of parallel drains were sunk in the direction of most rapid descent, and, being par-

tially filled with stones small enough to pass through a three-inch ring, were covered over with soil. At the bottom a main drain was constructed, generally in stone work or with tiles. The new practice met with great opposition from the advocates of Elkington's method, but finally came to be regarded as the only complete system applicable in all cases. In some instances the other plan may no doubt be economically adopted. The drains came at last to be made chiefly of tiles, for the manufacture of which the first machine was invented by the marquis of Tweeddale. The practice has been successfully introduced into the United States, and drain tiles are now a considerable branch of manufacture.—Wet lands are well known to be unfavorable to the production of large crops; it is also true that grains, potatoes, grass, &c., are sounder and better when raised upon lands not subject to excess of moisture. The soils that retain it are correctly described as cold, while the more porous soils are called warm. From the experiments of Mr. Parkes in a bog in Lancashire, it appears that by giving free passage to the water through a cold soil by thorough drainage, its temperature at the depth of seven inches may be raised 10° above that of undrained adjoining land of the same quality. Thus drainage produces the effect of a warmer climate, and may add in fact many days to the season; and this not merely by reason of the warmth extended for a longer period, but in the spring the soil is sooner prepared for cultivation, and may be in condition for ploughing and planting even two weeks before neighboring land of similar quality in other respects would admit of working. While frequent accession of water is a great benefit to lands through which it finds a ready passage, its retention impairs in various ways the fertility of the soil. It prevents the pulverization of the earth by the plough and harrow, and the circulation of air to the roots of the plants. It nourishes a growth of noxious plants, and in woodlands its injurious effect is seen in the production of many lichens, fungi, and other parasites upon the trees. Open ditches may be made in the lower grounds, where natural streams are not convenient for receiving the drainage from the underground ditches, which are made by laying tiles in trenches and covering them with soil. A section of an underground drain is represented in fig. 1. Sometimes coarse stones are used, but tiles are preferable on account of their less liability to become clogged. Several kinds of tile are made, each being suitable under certain circumstances. They are from 3 to 10 in. in diameter, and from 1 to 2 ft. in length. They are made of nearly the same kind of clay as brick, and are baked sufficiently to include as much porosity and toughness as possible. The different forms generally in use are represented in fig. 2. Any variety may be large or small. The horseshoe tile may be laid upon flagging or

boards, and all of them should be placed deep, out of the way of frost and the plough.—In Europe the largest draining operations have been those for reclaiming immense tracts

of submerged or boggy lands, some of which were altogether below the level of natural drainage. As early as 1436 attention was directed in England to the possibility of reclaiming the fens bordering the river Ouse and its tributaries, now known as the Bedford Level. These covered an area of about 400,000 acres, which in ancient times appears to have been in a condition for cultivation. The tract presents but very limited natural channels for conveying the water into the sea on the north-east. The attempt to embank and deepen these in the 15th century was unsuccessful, but it was renewed by the earl of Bedford in 1634. In three years he expended £100,000 in embankments for keeping out the waters of the rivers, and removing those within by pumping. This attempt also failed; but in 1649 his son recommenced operations, and succeeded after an expenditure of £300,000 more. From that time the lands reclaimed have been kept free from water by machinery worked by windmills. Among the numerous drainage channels cut through these lands are two nearly parallel, more than 20 m. in length, and both navigable, serving to cut off a long circuitous reach of the river Ouse. By other direct channels made during the present century above the outlet of the same river, and also of the neighboring river Nene, many thousand acres more have been reclaimed. The steam engine has been advantageously substituted in many instances for the windmills; and it has been found practicable to estimate closely the power and expense required to keep an area of given extent thoroughly drained. The annual fall of rain averaging 26 in., there would be, with a very moderate allowance for evaporation, 2 in. per month of water to be raised, or $1\frac{1}{2}$ cubic feet of water as a maximum on every square yard of surface. The amount on an acre, 7,260 cubic feet, may be raised 10 ft. and discharged in about 2 hours and 10 minutes by the power of one horse. A steam engine of 10-horse power could then each month raise to the same height and discharge the water from 1,000 acres in 232 hours.—The drainage of Haarlem lake in Holland, undertaken in 1839, was a gigantic

operation of this class. From an area of 70 sq. m. of average depth of water of $12\frac{3}{4}$ ft., situated below the level of any sluices that could be constructed, it was required to raise the water an average height of 16 ft., and to an estimated possible amount of 35,000,000 tons in a month. An enormous steam engine was constructed in London for working 11 pumps of 63 in. diameter each and 10 ft. stroke, the maximum capacity of all which was to raise 112 tons of water 10 ft. at each stroke. These were set around the circular tower which contained the engine, and from the upper portion of which the balance beams radiated, one for each pump. They raised in actual work 66 tons per stroke, discharging the water in a large canal 38 m. long, and from 115 to 130 ft. wide. Two other similar engines were applied to the same work, and the pumping was continued from May, 1848, to July 1, 1852. Then the area was thoroughly drained. The entire expenses from the commencement of operations in 1839 to the close of 1855 were estimated at £748,445, which would be more than paid by the proceeds of the sale of the lands. The draining of the lake, however, increased a difficulty which will be appreciated by a consideration of the system of drainage in Holland. Along much of the seaboard of that country the waters of the ocean are kept from overflowing the land by immense dikes. The country is divided into several districts, called hydraulic administrations, each of which has three divisions of surface, viz.: natural lands, basins, and polders. The basins comprise the marshes, lakes, canals, and drains, having one surface level, which is below high and above low tide, and connect with the sea by sluices furnished with gates, which open when the internal waters are higher than the external, and shut when they are lower. The polders are lands which lie below the surface of the waters in the basins, and can only be kept dry by pumping. The Rynland hydraulic administration comprises 305,000 acres, which before the draining of Haarlem lake was divided into 76,000 acres of natural lands, 56,000 acres of basin, and 173,000 acres of polder lands; but since the addition of the lake to the latter, the basin covers only 11,500 acres, while the polder lands have an area of 217,500 acres. Now the basins are the reservoirs of the waters which are raised from the polders and also of the drainage from the natural lands. When the tides are regular, at every ebb they empty a portion of their contents, and thus maintain a capacity to receive the natural and artificial drainage until the next ebb; but if by the action of the winds the external waters are held at a higher level than those in the basins through the period of an ebb tide, a collection of water in the latter ensues, and may come to equal their capacity. Before this occurs, however, the pumping from the polders must cease, for some space must be allowed for the natural drainage. At about

the mean level of the tides in the Zuyder Zee there is a mark upon a pile which is called the A. P., or Amsterdam pile, and which is the point of reference for regulating the height of water in the basins. There is also a mark for each administration, called the point of arrest. This point is not at the same level for all the administrations, some being allowed to continue their pumping operations longer than others. If the water in the basins were allowed to become too high, there would be danger of the overflowing and breaking away of the dikes. It will therefore be seen that the area of the basins is an important matter. If it bears only a small proportion to that of the land to be drained, they soon become filled, and unless they can empty their contents into the sea, the drainage of the polders must cease, and consequently they will become overflowed. As the range of tide along the Dutch coast is about 6 ft., only a small range of rise and fall, or capacity, can be allowed for the basins, when their area bears so small a proportion to that of the drained lands as it does in the Rynland hydraulic administration since the drainage of Haarlem lake has so greatly reduced the basin area. One circumstance has been taken advantage of in the work of draining, which is that the S. W. winds raise the level of the waters in the N. E. portion of the basins so that they may continue to discharge their contents longer than they could if they remained level. The S. W. end of the Zuyder Zee, also, by having its water level depressed, can continue to receive the drainage from the lands longer than if the surface remained level. The wind, therefore, is utilized as a source of work or energy, which goes far to make up for the loss incurred by diminution of the area of the basins. The draining of Haarlem lake had become a matter of necessity more than of utility; for, as it lies in a peat formation of great depth, connected with other lakes, the barriers were constantly being washed away, which, by increasing the surface of the water, allowed the waves to become higher by the action of the wind; and thus the surrounding country became subject to inundation.

DRAKE, Daniel, an American physician, born in Plainfield, N. J., Oct. 20, 1785, died in Cincinnati, Nov. 5, 1852. His father emigrated to Mason co., Ky., in 1788, where Daniel lived until his 16th year on a small farm. In December, 1800, with very little education, he was placed under the care of Dr. William Goforth of Cincinnati as a student of medicine, and in 1804 commenced practice. In 1816 he graduated at the university of Pennsylvania, and in 1817 he lectured one session in the Transylvania medical school at Lexington, Ky. In December, 1818, on his personal application, the legislature of Ohio granted a charter for the medical college of Ohio at Cincinnati, and also established there the commercial hospital. In the autumn of 1820 the former institution was opened for students, and

for two sessions Dr. Drake was connected with it. In 1823 he again became professor in the Transylvania school, and afterward in medical colleges at Philadelphia, Louisville, and Cincinnati. As a professor of the theory and practice of medicine he held an eminent position, and as a practitioner his reputation was coextensive with the Mississippi valley. His writings were voluminous, but generally not intended for permanent use. His first considerable work was "An Historical and Scientific Account of Cincinnati" (1815). His last work, on which his fame as an author principally rests, was "A Systematic Treatise, historical, etiological, and practical, on the Principal Diseases of the Interior Valley of North America, as they appear in the Caucasian, African, Indian, and Esquimaux Varieties of its Population" (2 vols., 1850-54). A memoir by Edward D. Mansfield was published in Cincinnati in 1855.

DRAKE, Sir Francis, an English navigator, born near Tavistock, Devonshire, according to some authorities in 1539, and to others in 1545 or 1546, died near Puerto Bello, Dec. 27, 1595. He received a scanty education through the liberality of a kinsman, and was apprenticed to the master of a bark, who bequeathed him his vessel. Being thus at the age of 18 years a good sailor and the proprietor of a ship, he made commercial voyages to the bay of Biscay and the coast of Guinea. He then sold his vessel and invested the proceeds with all his savings in the expedition of Capt. Hawkins to Mexico in 1567, receiving the command of the *Judith*. The fleet was attacked by the Spaniards at San Juan de Ulua, and only two of the six ships escaped. Drake returned to England with a loss of his entire property, and fruitlessly petitioned the court of Spain for indemnity. Enraged by his treatment, he began to sail with the avowed object of pillaging the Spaniards. In 1570 he obtained a commission from Queen Elizabeth. In 1572 he armed two ships at Plymouth, with which, joined by a third at Port Pheasant, on the coast of South America, he made a descent upon New Granada, captured and plundered various Spanish settlements, and made at the expense of his enemies a fortune vastly larger than that they had taken from him. He returned to England in 1573, and was welcomed as a hero. While at Darien he had seen from a mountain top the waves of the Pacific, and had there conceived the purpose of an expedition into those waters. Under the patronage of Elizabeth, he set sail from Plymouth, Dec. 13, 1577, with five vessels and 164 gentlemen and sailors, to follow the route which had been traced by Magellan. Drake pillaged the Spanish settlements of Peru and Chili, captured a royal galleon richly laden with plate, and took possession of California in the name of the queen of England; and then, fearing to meet the Spaniards in superior force if he returned, he sought to find a N. E. passage to the

Atlantic. Repelled by the severe cold, he determined to make the circuit of the globe. He traversed the Pacific ocean, the archipelago of the Spice islands, and the Indian ocean, doubled the cape of Good Hope, and arrived at Plymouth in November, 1580. Elizabeth received him with favor, and soon afterward knighted him and partook of a banquet on board of his ship. The rupture which followed between Elizabeth and Philip II. gave Drake a new opportunity, and within one year he captured and plundered Cartagena and several other towns, burned the forts of San Antonio and Saint Augustine, and visited and brought away the remains of the colony which Raleigh had planted in Virginia. In 1587 he was placed in command of a fleet of about 30 sail designed to attack the Spanish ports. He destroyed 100 ships in the harbor of Cadiz, and captured an immense carrack, from papers in which the English first learned the value of the East India traffic, and the mode of carrying it on. In 1588, as vice admiral, he commanded one squadron of the fleet by which, with the assistance of the elements, the "invincible armada" was annihilated. In 1589 he ravaged the coasts of the Spanish peninsula, and in 1592-'3 was a member of parliament for Plymouth. In 1594, a report having reached England that Spain was preparing a fleet more numerous and powerful than the armada, he again entered the service. Convinced that the West Indies was the point where Spain could be best attacked, he sailed for America in 1595 with 26 vessels, in company with Admiral Hawkins. A divided command produced its usual bad results, and their first attempts were inharmonious and fruitless. At Porto Rico Hawkins died, either of a wound or of chagrin, and Drake then gained new triumphs. He burned Santa Marta, Rancheria, Nombro de Dios, and Rio Hacha; but a fatal malady broke out among his sailors, and as he heard of the defeat of a division of his forces which he had sent to operate by land, he fell sick and died from the combined effects of fever and of mental agitation on account of the reverses of the expedition, and was buried at sea.

DRAKE, Friedrich, a German sculptor, born in Pymont, June 23, 1805. He began life as a mechanic, and struggled against poverty until at length his talent was recognized and developed by Rauch. His first work, representing a madonna, was purchased by the empress of Russia. His busts of his teacher, of Schinkel, and of the Humboldts made his reputation; and he eventually became a member and professor of the academy of Berlin. In 1836 he produced a bust for the Möser monument at Osnabrück, and in 1844 he completed a colossal group allegorically representing the eight provinces of Prussia, for the royal palace. Among his subsequent works are two large marble statues of Frederick William III., one in Stettin (1845), and the other in the Thiergarten of Berlin (1850); Oken's bust, and the statue of the

elector John Frederick, in Jena (1858); one of Prince Malte-Putbus, in Rügen (1859); one of Melanchthon, in Wittenberg; the colossal equestrian statue of Frederick William III., in Cologne (1864); and the statue of Schinkel, in Berlin (1869).

DRAKE, Joseph Rodman, an American poet, born in New York, Aug. 7, 1795, died there, Sept. 21, 1820. He lost his father in early life, and with three sisters struggled against adversity. He studied medicine, and shortly after taking his degree in 1816 married a daughter of Henry Eckford, the eminent ship builder, which placed him in affluence. James Fenimore Cooper and Fitz-Greene Halleck were among his most intimate associates, and a conversation between them as to the poetical uses of American rivers, in the absence of historical associations such as belong to the streams of the old world, was the occasion of Drake's longest and most imaginative poem, "The Culprit Fay," written in August, 1816. He travelled in Europe in 1818, and during his tour addressed several witty poetical epistles to his friend Halleck. In 1819 Drake and Halleck formed a literary partnership, and contributed, under the various signatures of "Croaker," "Croaker, Jr.," and "Croaker & Co.," many effective and amusing verses to the New York "Evening Post." The "Croakers" were collected and included in an edition of Halleck's poems published in 1869. Drake's health failing, he passed the winter of 1819-'20 in New Orleans. But the progress of consumption could not be arrested, and a few months after his return to New York he died at his residence in Park row, and was buried at Hunt's Point in Westchester county. His death called forth a beautiful poetical tribute from Fitz-Greene Halleck. In 1835 a volume of Drake's poetry, including his most popular poem, "The American Flag," was published in New York by his only daughter, Mrs. Janet Halleck De Kay. No American poet, with the exception of Bryant, has attained an equally early maturity of poetic genius. Almost all of his poems, including "The Culprit Fay," were written before he was 21, while several were produced at the age of 16.

DRAKE, Nathan, an English physician and miscellaneous writer, born in York in 1766, died at Hadleigh, Suffolk, June 7, 1836. He was educated at the university of Edinburgh, and practised his profession in Hadleigh from 1792 till his death, during which time he was a frequent contributor to literary and medical periodicals. His works are numerous; they include "Shakespeare and his Times" (2 vols. 4to, London, 1817), and many volumes of essays, criticisms, and illustrations of the writings of the age of Queen Anne.

DRAKE, Samuel Gardner, an American author, born at Pittsfield, N. H., Oct. 11, 1798, died in Boston, June 14, 1875. He was educated at the common school, and between the ages of 20 and 27 was a school teacher. He removed to Bos-

ton, and in 1828 established an antiquarian book store, the first of its class in the United States. In 1825 his literary and antiquarian labors commenced with the republication with notes of Church's "Entertaining History of King Philip's War," of which several editions have since appeared. In 1833 he reprinted five old tracts, which, with the preceding work, comprise in his opinion all that can be recovered in relation to King Philip's war. In 1832 appeared his "Indian Biography," and in 1833 the "Book of the Indians, or History and Biography of the Indians of North America," a work of high authority for facts, and of which the 11th edition, much enlarged, appeared in 1851. His remaining publications on Indian history are "Old Indian Chronicles" (1836), "Indian Captivities" (1839), "Tragedies of the Wilderness" (1841), "Introduction and Notes to Hubbard's Indian Wars" (2 vols., 1865), "The old Indian Chronicle" (a new series, 1867), and "History of the Five Years' French and Indian War" (1870). Among his important contributions to American history are a "Memoir of Sir Walter Raleigh" (1862), "Introduction and Notes to Mather's Relation" (1862), and "Annals of Witchcraft in the United States" (1869). Mr. Drake was one of the founders of the New England historical and genealogical society, its president in 1858, and for many years editor of its quarterly "Register." In 1858-'60 he resided in London.—His son, FRANCIS S. DRAKE, published in 1872 a "Dictionary of American Biography" (1 vol. 8vo, Boston; new ed., 1874).

DRAMA (Gr. *δρᾶμα*, from *δρᾶν*, to do or act), a story represented by action. The principle of imitation is inherent in human nature; painting, sculpture, and the drama must be coeval with society, and have been practised in some form by almost every nation. Among the South sea islanders a rude kind of drama was discovered. In China the drama dates from remote ages. The war dance of the Indian and the African, intermingled with pantomimic descriptions of the preparations for battle, the stealthy advance upon the foe, the combat, and the death of the enemy, is essentially a dramatic exhibition. But that form of the drama which is accepted and followed in Europe, divided chiefly into tragedy and comedy, was the creation of the ancient Greeks. The religious festivals of Bacchus were believed to have been introduced into Greece by Melampus. In the Bacchic ritual an ode in honor of the god was recited; and to produce the best ode, which should be selected by the priests to be inserted into their ceremony, became a favorite contest among the poets. A goat was either the principal sacrifice at the altar, or the prize awarded to the successful competitor; thus from the two words *τράγος*, goat, and *ᾠδή*, song, came the Greek *τραγῳδία*, tragedy (literally, goat song). In like manner, at the rustic festivals or harvest homes of the Greeks, semi-religious ceremonies, composed of odes

and dances in honor of Bacchus, were enacted. These odes, being more genial and comic, were called *κωμῳδία*, comedy, from *κῶμη*, village, and *ὥδή* (literally, the song of the village).—The earliest known form of drama is the dithyrambus, a hymn in honor of Bacchus, song by a chorus accompanied by music, gesture, and dances. About 570 B. C. Susarion, a native of Megara, recited an ode at Athens. In 535 Thespis, a native of Icaria, recited an ode, with responses by a dithyrambic chorus; in this we perceive the first germ of dialogue. Such were the rude elements found by Æschylus about 500, and out of them he created the drama as we now behold it. Nothing essential has since been added to its structure. He removed the chorus into the background, and used them only as an auxiliary. He brought a second actor upon the scene, and introduced dialogue; thus the drama became an action instead of a narrative. He invented scenery, costume, and machinery. Banishing the lewd and Bacchanalian character from the dithyrambic hymn, he supplied its place with pure tragedy. From his works were gathered those rules called the unities, referred to by Aristotle. These changes were wrought within 30 years. His expansion of the drama caused the Athenians to build the great theatre of Bacchus, the Lenæum, the former theatre having broken down under the pressure of the people gathered to witness a representation in which Æschylus and Pratinas were rivals. Thirty years later Sophocles introduced a third actor, and thus diffused the dialogue and fertilized the action. As a dramatic poet he surpassed Æschylus by a noble grace and a sweet majesty. Fifteen years afterward Euripides enabled Greece to behold as contemporaries the three greatest purely tragic poets the world has produced. In reviewing their works we must remember that Æschylus was the creator of that fanciful world which Sophocles and Euripides cultivated. The dramas of Æschylus are dark, gloomy, and terrible; thunder and lightning are their atmosphere, and demigods their *dramatis personæ*; his human beings are gigantic in moral stature, and removed above our sympathies. Sophocles drew human nature as it ought to be. Euripides depicted men and women as they were. The origin of the drama is popularly but erroneously ascribed to Thespis. This improvisatore did no more than improve upon the dithyrambus; he first organized a regular chorus, and invented dances of peculiar energy and grace; but his performances were a kind of ballet farce. The tragedy of the Greeks was a fable or a series of events begotten of each other in a natural sequence. It began with a simple position, so selected that the auditor required no explanation to understand the present condition of affairs. The development of the characters was required to be simultaneous with the action, the one being involved in the other. The action should not stray from the one place

beyond such a limit as the time employed in the performance might naturally permit; nor should a lapse of time take place during the piece longer than one day. These unities of action, place, and time, however, so strenuously insisted upon by the French dramatists, were not always strictly observed by the Greeks. Aristotle refers indistinctly to the unity of action; he says in reference to the unity of time: "Tragedy endeavors as much as possible to restrict itself to a single revolution of the sun." Of the unity of place he says nothing. The Greek tragedy was often composed in trilogies, or three distinct plays, all connected; such, for example, was the trilogy of Æschylus, formed of the "Agamemnon," the "Choëphori," and the "Eumenides." In the first, Agamemnon, returning from the siege of Troy, is murdered by his wife Clytemnestra; in the second, Orestes, Agamemnon's son, avenges his father by the slaughter of his mother; in the third, Orestes is pursued by the Furies for this unnatural deed; the gods cannot agree upon his case until Minerva decides in his favor, and releases him from the torture of the avenging divinities. These three conjoined formed a complete action. The early history of comedy is more obscure than that of tragedy. The earliest comic poet of whom we have remains is Aristophanes, who flourished nearly a century after Æschylus. He was the last of what was called the old school. Comedy was divided into three forms, the old, the middle, and the new. In the first or old comedy, the characters were real living personages, who were freely satirized under their real names. This license was soon so abused that a law was passed forbidding the names of real personages to be used in comedy. This impediment produced the second or middle comedy, where the prohibition was evaded by giving fictitious names to the real characters, and distinguishing the individual intended to be satirized by a mask or by some unmistakable inference. The middle comedy lasted about 50 years, when it was superseded by the third or new comedy; in this form the characters and the subject were fictitious, and as the old satirized and ridiculed statesmen, orators, and generals under their real names, so the new was aimed at abstract vice, and not at the individual offender. As tragedy descended from the contemplation of divine matters to depict human woes, it gradually lost its grandeur. So, also, as comedy divested itself of its direct influence upon men and things, and from a statesman became a philosopher, it lost its pith and power. The list of dithyrambic poets preceding Æschylus, from 700 to 525 B. C., includes Archilochus, Simonides, Lasus, Arion, Stesichorus, Solon, Susarion, Hipponax, Theognis, Thespis (birth of Æschylus). Afterward came Chærius, Phrynichus, Epicharmus, Æschylus (invents the drama, and first exhibits in 499), Chionides, Sophocles (first victory in 468), Euripides (first exhibits in 455), Cratinus,

Aristarchus, Ion, Crates, Achæus, Melanippides, Pherecrates, Phrynichus the comic poet, Lyssippus, Eupolis, Aristophanes (427), Agathon, Xenocles, Amipsias, Sannyrion, Astydamos, Antiphanes, Theopompus, Eubulus, Alexis, Heraclides, and Menander (first exhibits in 321), after whom the Greek drama died obscurely. The Romans derived their drama from the Greeks. Terence, Plautus, and Seneca are the only Latin dramatists worthy of mention, and these are but translators and imitators of the Greek. The only element introduced by the Romans into the drama was farce, an invention of the Tuscans; buffoonery became more popular than wit. In truth the Roman people took little pleasure in pure intellectual amusement; they preferred to watch the agonies of the body suffered in the circus, rather than sympathize with the woes of the soul simulated in the theatre.—Thus ended the first or classic age of the drama. The second, or romantic age, gave its first indication of existence in the 12th century, when dramatic performances called *entremets* were introduced, as the word implies, between the services at royal banquets and carousals. These *entremets* soon became pageants, masks, and mummeries, and lasted as distinct dramatic entertainments up to the period of Shakespeare. Simultaneously a dramatic composition called a mystery, usually founded on passages of Scripture, was introduced and became a popular exhibition on saints' days. Subjects from the Bible, rudely treated in the form of a dialogue between the holy personages, were represented on a stage erected in the church or church yard, the priests and acolytes being the actors. These performances were carried to an abuse, and became so blasphemous that they were suppressed. The next form of drama was the morality, bearing a relation to the mystery similar to that between the new and old comedy of the Greeks. The morality was aimed at abstract vice, its action was a fable, its characters were typical. In the 15th and 16th centuries histories began to be written—long, rambling pieces of action without form or object, but introducing rudely the design of that romantic drama destined to so wondrous a perfection under the hands of Shakespeare and his colleagues. As the classic drama was derived from the dithyramb, a pure poetic germ, subsequently developed into action, the romantic drama was derived from the pageant, mask, or mummer, a pantomimic germ, subsequently developed into poetry. In the first the action is subservient to the passion; in the second the passion is subservient to the action. In the Elizabethan age the romantic drama sprang at once into existence; and as in the single life of Æschylus the classical or Greek drama passed from infancy to maturity, so Shakespeare and his colleagues raised the romantic or Gothic drama from rudeness to the highest perfection it has ever achieved. In the roman-

tic drama the unities of time, place, and action are not observed. The poet is allowed unbridled license; prose and poetry may be mingled without rule or reason, beyond the aptitude of each to the moment and the character. The English dramatists of this age gave originality at least to the form of the romantic drama, and, whatever its faults, it was new. The French and Italian poets clung to the Greek models; Corneille and Racine were imitators of Sophocles and Euripides; Alfieri affected the same ancient simplicity. As students of the Greek, their individual merit is great; but having had no share in the progress of the drama, they have no prominent place in its history. The Italians and Spaniards at this period contrived a species of performance, part pantomime, part farce, part comedy of intrigue. It was derived from those Italian narrators of whom Boccaccio is the best type, and represented dramatically short and pithy tales. Lope de Vega was the first to inaugurate this comedy of intrigue, and Calderon surpassed him in it; it was quickly imitated and greatly improved by the French, who by admitting more Italian elements gave it variety and scope. Hardy, Rotrou, and Corneille, Scarron and Quinault, prepared the public taste for Molière, who truly founded and made the second or middle age of comedy, as Shakespeare and his colleagues made the first or old. Comedy at this time mainly occupied the stage. In England the four great masters, Wycherly, Congreve, Vanbrugh, and Farquhar, brought forth the prose drama. In the beginning of the 18th century the sentimental drama, a mixture of comedy and tragedy, was introduced, but cannot be considered a forward movement in the art. In Germany it obtained great popularity under Kotzebue, and at the same time a wild and ideal, often mythic and philosophical form of dramatic poetry was created by Schiller and Goethe. These poets rather embellished dramatic literature than added to the development or progress of the drama as an art. Lessing, their predecessor, may be said to have founded the German drama, but he attempted no reform.—The next and last great step which the drama has made, and one that has become prominent in the present age, is the invention of opera, or a drama in which music takes the place of poetry, and the dramatic action is subservient to a new musical development. It is a mistake to presume that an opera is a musical drama. The musical form of an opera and its dramatic treatment are essentially different from the form and treatment of a drama based on the same fable. There is also in the form of the music, apart from the libretto, a plan and proportion to which the drama must be subservient.—Among the various minor forms of the modern drama are melodrama, farce, vaudeville, and pantomime. Melodrama owes its invention to the laws which restricted the performance of tragedies and comedies to certain privileged theatres. Booths were erect-

ed in which serious pantomimes, or dramas without words, were performed, accompanied throughout with expressive music. By degrees the actors ventured a few extempore phrases or jests. This license was gradually extended, until dialogue was regularly introduced, and the music was only used to accompany the movement of the actors. Melodrama is now understood to be a drama wherein the passion and development of character are subservient to the action and plot; whereas tragedy is a drama where the action and plot are subservient to the passion and development of character. Farce is a humorous piece of buffoonery, in which probability may be outraged both in the incidents and character, and stands in relation to comedy as melodrama does to tragedy. Vaudeville is an invention of the French stage. It has its name from *vau de Vire*, which was originally a satirical song containing a keen, witty thought, and applicable to some popular person or event. It was a lyric epigram invented in that part of Normandy called Val or Van de Vire, and carried thence to Paris, where these musical satires became the vogue. Presently the writers of small comedies threw their keenest epigrams into verses which might be sung to any air that would happily suit them, and were called vaudivilles. The comic pieces through which they were scattered eventually received the name. When the work is but slightly speckled with these musical epigrams, it is distinguished as a *comédie vaudiville* or a *drame vaudiville*. Pantomime is a drama without language, composed of gesture accompanied with music. It is probably the most ancient form of drama, and has changed less in its essential character than any other. The most perfect and most elegant kind of pantomime is the ballet, where graceful dances are interspersed.—Further accounts of the dramatic literature of the principal nations will be found under the titles of the respective countries.

DRAMBURG, a town of Prussia, in the province of Pomerania, 53 m. E. by N. of Stettin; pop. in 1871, 5,473. It has a Protestant gymnasium, a normal school, and several woollen factories, tanneries, and distilleries.

DRAMMEN, a commercial town of Norway, on the S. coast, in the province and 20 m. S. W. of the city of Christiania; pop. in 1866, 13,032. It lies on both sides of the river Drammen, and is composed of three small villages, separated by channels of the river. The commerce of which Drammen is the centre gives it the third rank among the cities of Norway, and in respect to its timber trade it stands first. It manufactures tobacco, earthenware, sail cloth, rope, carriages, leather, &c.; and besides exporting timber, has a commerce in iron ware and agricultural produce. About 40,000 tons of shipping are annually employed in its port. It suffered considerably in 1850 and 1857 from conflagrations.

DRANESVILLE, a village of Halifax co., Virginia, 20 m. W. by N. of Washington, where a

battle was fought Dec. 20, 1861, by a brigade of the Union army of the Potomac under Gen. Ord, and a confederate detachment under Gen. Stuart. The engagement was mainly an artillery duel, in which, the Union guns being better served, the confederates suffered most, and withdrew. The Union loss was 69 killed and wounded; that of the confederates more than twice as many. This skirmish was the first success gained by the army of the Potomac, and called forth a special congratulatory letter from the secretary of war.

DRAPER. I. John William, an American chemist and physiologist, born at St. Helens, near Liverpool, England, May 5, 1811. He received his early education in the Wesleyan Methodist school at Woodhouse Grove, and was then placed under private instructors, devoting much attention to chemistry and natural philosophy. The higher mathematics were also a part of his early training. He subsequently went to the university of London, where he prosecuted his chemical studies. Some of his ancestors had been attracted to America before the revolution, a greater part of his family connections followed, and in 1833 he joined them. He continued his chemical and medical studies at the university of Pennsylvania, where he took the degree of M. D. in 1836, with the rare distinction that his thesis was selected for publication by the medical faculty. A few weeks later he was appointed professor of chemistry, natural philosophy, and physiology in Hampden-Sidney college, Virginia. During his residence there his time was occupied in chemical and physiological investigations, many of the latter appearing in the "American Journal of Medical Sciences." In 1839 he was called to the chair of chemistry and natural history in the academic department of the university of the city of New York, where, besides instruction in those branches, he delivered lectures to the advanced undergraduates on physiology. In 1841 he was appointed professor of chemistry in the university medical college, and in 1850 physiology was added to the chair of chemistry. He is now (1874) president both of the scientific and the medical department of the university. Although his researches have been mostly experimental, involving great labor and cost, he has written voluminously and with high reputation. Besides contributions to various other scientific journals, he furnished to the "London and Edinburgh Philosophical Journal" and to the "American Journal of Science and Arts" between 1837 and 1857 about 40 memoirs, principally on topics previously little understood. For an account of some of these investigations, see ACTINISM, ACTINOMETER, and PHOTOGRAPHY. He is the author of many literary works, reviews, &c., the latter for the most part published anonymously; of a "Treatise on the Forces which produce the Organization of Plants" (4to, New York, 1844); of a popular "Text Book on Chem-

istry" (12mo, 1846), and another on "Natural Philosophy" (8vo, 1847), which consist of excerpts from his courses of lectures; and of a treatise on "Human Physiology, Statical and Dynamical, or the Conditions and Course of the Life of Man" (8vo, 1856), many editions of which have been published. His "History of the Intellectual Development of Europe" appeared in 1862, and shortly afterward in England. It has been translated into French, German, Italian, Polish, Russian, &c. In 1865 four lectures that he had given before the New York historical society were collected in a volume under the title of "Thoughts on the future Civil Policy of America;" and between 1867 and 1870 appeared in three volumes his "History of the American Civil War." In the preparation of this work he enjoyed singular advantages from the friendship and assistance of officers, both civil and military, who had taken a conspicuous part in the events. This work too has been largely translated. To him is due the discovery of many fundamental facts of spectrum analysis; and among his latest papers are "Experimental Examinations of the Distribution of Heat and of Chemical Force in the Spectrum." **II. John Christopher**, son of the preceding, born in Prince Edward co., Va., March 31, 1835. He graduated in the medical department of the university of the city of New York in 1857, and from 1858 to 1860 was professor of physiology in the same institution. For three years he was professor of chemistry in the Cooper union, and he is now (1874) professor of chemistry in the university medical college, and professor of physiology and natural history in the college of the city of New York. He has published a treatise "On Respiration" (8vo, New York, 1856), and a "Text Book on Anatomy, Physiology, and Hygiene" (8vo, 1856); and has contributed freely to English and American medical and scientific journals. **III. Henry**, brother of the preceding, born in Prince Edward co., Va., March 7, 1837. He graduated in the medical department of the university of the city of New York in 1858, and since 1860 has been professor of physiology there, and is also professor of physiology and analytical chemistry in the scientific department. He has made, at Hastings on the Hudson, the largest telescope (28 inches aperture) in the United States, and has devoted much attention to photographic and spectroscopic examination of the moon and other heavenly bodies. He has published a memoir "On the Construction of a Silvered Glass Telescope" (4to, Smithsonian institution, 1864), and "Text Book of Chemistry" (12mo, New York, 1864); and has been a frequent contributor to scientific periodicals.

DRAPER, Sir William, an English military officer, born in Bristol in 1721, died in Bath, Jan. 8, 1787. He was educated at Eton and Cambridge, entered the army, won distinction in the East Indies, obtained a colonelcy in 1760, acted as brigadier at the capture of Belle Isle

in 1761, and led the land forces at the taking of Manila in 1762. When the first of the "Junius" letters appeared in January, 1769, he came forward under his own name in defence of his friend the marquis of Granby. Junius replied with marvellous skill and sharpness; two more letters passed on each side, and Sir William then retired from the contest. Six months afterward, when he saw these letters republished, he appeared twice again in print to complain of their injustice, and was again worsted by his anonymous antagonist. During the same year he visited America, where he married Miss De Lancey of New York. In 1779 he was appointed lieutenant governor of Minorca, and on the surrender of that island brought 29 charges against the governor, Murray, for all but two of which he was obliged to offer an apology.

DRAUGHTS, a game played by two persons, on a checkered board like the chess board, with 12 or 20 pieces on each side, which capture each other by angular movements governed by certain rules, until the game ends by one player losing all his pieces, or by both players getting their pieces into positions from which they cannot be moved. In America the game is commonly called checkers. In France it is known as *le jeu de dames*, in Italy as *dama*, in Germany as *Damen*. It has been played in Egypt for more than 4,000 years, the Egyptian-Arabic name being *dameh*, and made its appearance in Europe only three or four centuries ago, when there was much intercourse between southern Europe and Egyptian ports. In Polish, the game has, besides that of *dama*, the name of *areaby* or *wareaby*, supposed to be equally of oriental origin. In Spanish, the word *ajedrez*, applied to both chess and draughts, is also of eastern derivation, and appears to be nearly equivalent to the American term checkers.—The origin of the game is uncertain. It is supposed to have preceded chess, and it is certain that in Egypt, as appears from the monumental paintings, it was common under the earlier Pharaohs. It was played as now with pieces, all of which on the same board were alike in size and form, though on different boards they varied, some being small, others large and rounded at the top or carved into human heads. The kind used by King Rameses II., about 1300 B. C., who is represented on the walls of his palace at Thebes playing at draughts with the ladies of his household, resembled small ninepins, and seem to have been about $1\frac{1}{2}$ inch high, on a circular base half an inch in diameter. Some have been found of ivory, $1\frac{3}{4}$ inch high and $1\frac{1}{2}$ in. diameter, with a small knob at the top. The opposite sets of pieces were distinguished sometimes by their color and sometimes by their form, one set being black, the other white or red, or one set having round, the other flat tops. It is uncertain how the Egyptians played the game, though from the position of some of the pieces in the paintings it seems that they did not take back-

ward, as is done in the Polish game. The modern Egyptians, who use pieces similar to those used by their predecessors, play the game as it is generally played in Europe and America. By the Greeks the invention of draughts, as well as of dice and many other things, was poetically ascribed to Palamedes, one of the heroes of the expedition against Troy.—In playing draughts, the board is placed with a double corner on the right hand of each player. Each player places his pieces on the three lines of squares nearest to him. In England the white squares are played upon; in Scotland and America the black squares are generally selected. The game is begun by each player moving alternately one of his men along the diagonal on which they are first placed, one square at a time to the right or the left. When two hostile pieces encounter each other, the one that has the move may take the other, if there be a vacant square of the color played upon behind it, by leaping over the other into that square. The piece leaped over is removed from the board. If several pieces should be exposed by having alternate open squares behind them, they may all be taken at once, and the taking piece placed on the square behind the last piece captured. When a piece has reached one of the four squares of the extreme opposite row, it becomes a king, and is crowned by placing one of the captured pieces upon it, or, as the men are now sometimes made, by turning it over and exposing a crown represented on the other side. Kings can move backward as well as forward, though only one square at a time. The principal laws of the game are these: If a piece is touched, it must be moved, if a move be possible; the player who has the move must take a piece which is exposed to capture; if he neglects to take it, his adversary may remove from the board the piece with which the capture should have been made; but a player has no right to decline to take under any circumstances. The first move of each game is to be taken by the players in turn; if lots are drawn for the move, he who gains the choice may move first or require his adversary to move. In Polish draughts, a variety of the game played not only in Poland, but in other parts of the continent of Europe, and sometimes in England and America, the pieces are moved forward as in the English form of the game, but in taking they move like the kings of the English game, either backward or forward. The kings in the Polish game have the privilege of passing over several squares at one time, and even over the whole length of the diagonal when no pieces obstruct the move. Polish draughts is sometimes played with 40 pieces on a board divided into 100 squares.—M. Mallet, a professor of mathematics, published a treatise on draughts at Paris in 1668. Another teacher of mathematics, William Paine, published at London in 1756 an "Introduction to the Game of Draughts." The best work on the subject is

the "Guide to the Game of Draughts," by Joshua Sturges (London, 1800), of which an improved edition appeared in 1835, the whole of which, with additions, is comprised in the "Handbook of Games" which forms one of the volumes of "Bohn's Scientific Library" (London, 1850).

DRAVE (Ger. *Drau*; Hung. *Dráva*; anc. *Dravus*), a river of Austria, one of the principal tributaries of the Danube, rises from two sources in the E. portion of the Tyrol. In its upper part it is small and extremely rapid, with craggy and overhanging banks, but it becomes navigable at Villach, and flows E. and S. E. with a slow current through a low and marshy country, through Carinthia and Styria, then along the S. border of Hungary, which it separates from Croatia and Slavonia, till it enters the Danube E. of Eszék, as a large and powerful stream, after a course of 360 m. Its navigation above Völkermarkt is obstructed by various falls and cataracts. The most important of its numerous affluents is the Mur, the largest river in Styria. Lienz in Tyrol, Villach, Marburg, Pettau, Warasdin, and Eszék are among the chief towns on its banks. Fish are plentiful in its waters, and some gold is washed from its sands. The valleys along its course are remarkable for their fertility. The Hungarian peasants descend this river on rafts of empty barrels after having disposed of their wine in the mountains of Carinthia.

DRAVIDAS. See ETHNOLOGY, p. 758.

DRAWING, the representation or delineation of objects, either as they appear to the eye, or as projected on assumed planes, or as designated by conventional signs having a certain similarity to the appearance of the objects themselves. The painter, with free hand, draws or sketches objects in their visible and natural forms; the mechanical or architectural draughtsman projects, according to certain established rules and principles, objects existing or designed; while from the notes of the surveyor the topographical draughtsman plots the surface of a field or locality, with its natural and artificial objects represented somewhat as they would appear projected on a transparent plane above them, but with certain conventionalities to express more definitely certain features. Architectural and mechanical drawing is in general the delineation of objects by geometric or orthographic projection. Since the surfaces of all bodies may be considered to be composed of points, the first step is to represent the position of a point in space, by referring it to planes whose position is established. In general these planes are assumed at right angles to each other (fig. 1), and the points projected upon them make up the drawings of the plan, end and side elevation. Let a brick be held flatwise in the corner of a rectangular box, with its sides parallel to the various sides of the box; if now from the several corners of the brick perpendiculars be let fall upon the adjacent sides, the points thus

found will be the orthographic projections of the corners; and if these points be connected by corresponding lines, there will be outlines of the brick under three views or projections: on the bottom of the box, a rectangle 8 by 4 in., being the plan of the brick; on one side, a

FIG. 1.

rectangle 8 by $2\frac{1}{2}$ in., the side elevation; on the other side, a rectangle 4 by $2\frac{1}{2}$ in., the end elevation. If the brick be inclined to either or all of the sides of the box, the projected outlines will be varied; but the same rule for determining the position of points obtains, viz.: by letting fall perpendiculars on the planes to which they are referred. The orthographic projection of any object in outline is the shadow it would cast on a plane perpendicular to the rays of the sun, if held between it and the sun. Simple objects in general may be defined by two views, a plan and elevation; but often, to illustrate the construction of the interior, sections are necessary, that is, the appearances that might be presented were the objects cut by planes; all portions that would be thus absolutely cut are designated by filling up the outline with a quantity of inclined parallel straight lines, at equal intervals from each other; should there be distinct parts in section, in contact with each other, to prevent confusion the different sections are expressed by lines inclined in opposite directions. In most architectural and mechanical constructions it would be obviously impossible that they could be drawn full size. Scales are therefore made use of in which fractional parts represent wholes. The scale in most common use in architectural drawings is that of one fourth of an inch to the foot, or $\frac{1}{4}$ of the lineal dimensions; in mechanical drawings, one fourth or one eighth full size, that is, as usually understood, one fourth or one eighth of the lineal dimensions. Working drawings of machines,

or those intended to be used in construction, are generally laid off to as large a scale as possible; they are mostly outline drawings, consisting of lines to indicate the form of the object represented. The roundness, fullness, or obliquity of the individual surfaces is not indicated by the lines, although it may be generally inferred from the relation of the different views of the same part. The direct significance of an outline drawing is often considerably increased by strengthening those lines which indicate the contours of surfaces resting in the shadow. That all parts may be shade-lined according to one uniform rule, the light is supposed to fall upon the object obliquely at an angle of 45° (that the horizontal and vertical lines may be relieved equally), and in general (fig. 2) to fall from the upper left-hand corner of the paper diagonally; and the same rule is followed in the more finished drawings where both shade and shadow are introduced. As a means of avoiding the indefiniteness presented by mere outline, recourse is frequently had to the shading of the parts of a machine or edifice, which is usually done with color and a brush. In architectural drawings, a complete picture is often attempted with all the appliances of shade and shadow, intended to show the artistic effect of the construction. Color is introduced in both mechanical and architectural drawings, to show the material of which the construction is composed; and it is usual to imitate somewhat the

FIG. 2.

natural color of the substances.—Besides orthographic projection, architects, for the representation both of exterior and interior of edifices, often make use of perspective; and mechanical draughtsmen, for the better understanding of the parts of a machine than by separate plans and elevations, unite them by the rules of isometrical drawing. The science of perspective is the representation by geometrical rules, on a plane surface, of objects as they appear to the eye from an assumed point of view. All the points of the surface of a body are visible by means of luminous rays proceeding from these points to the eye, forming a cone of rays. The intersection of these rays by an intervening transparent plane is the perspective projection of these points, the rules for the projection of which mechani-

cally are simple and well established. The supposed transparent plane is called the plane of projection or plane of the picture. The horizon of the picture is the horizontal line resulting from the intersection of the plane of the picture by a horizontal plane passing through

FIG. 3.

the eye. Point of view or point of sight is the point where the eye is supposed to be placed. Vanishing points are points in a picture to which all lines converge that in the object are parallel to each other. An object is said to be in parallel perspective when one of its sides is parallel to the plane of the picture (fig. 3); in angular perspective when none of its sides are so. Isometrical drawing implies that the measures of the representations of the lines forming the sides of each face are equal. The principle of isometrical projection consists in selecting for the plane of the projection one equally inclined to three principal axes at right angles to each other, so that all straight lines coincident or parallel to these axes are drawn in projection to the same scale. To draw a cube in isometrical projection (fig. 4), with a radius equal to one side of the cube, describe a circle, inscribe

FIG. 4.

a regular hexagon, and draw lines from alternate angles to the centre; the hexagon will be divided into three parallelograms, each of which will represent a face of the cube; all the lines will be equal, and equal to the side of the cube. On these lines can be set off dis-

tances as in orthographic projection, but only upon these lines, or those parallel thereto. Curved or inclined lines are therefore to be established by reference to these lines, and not by direct measure of the lines themselves. Isometrical drawing is especially valuable to the mechanical draughtsman, as it embraces the applicability of a scale with pictorial representation. In drawings for the patent office it is of very general application.—Topographical drawing is the delineation of the surface of a locality (fig. 5), with the natural and artificial objects, as houses, roads, rivers, hills, &c., upon it, in their relative dimensions and positions; giving in miniature a copy of the field, farm, district, &c., as it would be seen by the eye moving over it. Many of the objects thus to be represented can be defined by regular and mathematical lines, but many other objects, from their irregularity of outline and their insignificance in extent, would be very difficult to distinguish. Certain signs have therefore been adopted into general use among draughtsmen, some of which resemble in some degree the objects for which they stand, while others are purely conventional. Sand is represented by fine dots, gravel by coarser dots; meadow or grass land is represented by tufts of little perpendicular lines; trees, although not consonant with the other parts of the plan, are represented often in elevation, at other times by clumps of foliage in plan, sometimes distinctive in their foliage; dwellings and edifices usually in plan, made distinctive by some small prefix, as a pair of scales for a court house, a sign post for a tavern, a horse shoe for a smithy, a church with a cross or steeple, &c. The localities of mines are represented by the signs of the planets which were anciently associated with various metals, and a black circle or dot for coal. Hills are represented by two methods, the vertical and the horizontal. In the first the strokes of the pen follow the course the water would take in running down the slopes, the strokes being made heavier the steeper the inclination; and systems have been proposed and used by which the inclination is defined by the comparative thickness of the line and the intervening spaces. In the system proposed for the United States coast survey, slopes of 75° are represented by a proportion of black to white of 9 to 2, and so down by nine grades to a slope of $2\frac{1}{2}^\circ$, in which the proportion is 1 black to 10 white. By the horizontal method, or by contours, hills are represented by horizontal lines traced round them, such as would be shown on the ground by water rising by equal vertical stages. The choice of a scale for a plot depends in a great measure on the purpose for which the plan is intended. Plans of house lots are usually named as being so many feet to the inch, plots of surveys so many chains to the inch, maps or surveys of states so many miles to the inch, and maps of railway surveys as so many feet to the inch, or so many inches to the mile. In the coast survey all the scales are expressed frac-

Fig. 5.

tionally and decimally. The scales of small harbor charts vary from 1:5,000 to 1:60,000; that of charts of bays and sounds is usually 1 to 80,000, of general coast charts 1 to 400,000. In the United States engineer service the following scales are prescribed: general plans of building, 1:120; maps of ground with horizontal curves, 1:600; topographical maps comprising $1\frac{1}{2}$ mile square, 1 m. to 2 ft., or 1:2,640; 3 miles square, 1:5,280; between 4 and 8 miles, 1:10,560; 9 miles square, 1:15,840; not exceeding 24 miles square, 1:31,680; 50 miles square, 1:63,360; 100 miles square, 1:126,720; surveys of roads and canals, 1:600. In the plotting of sections, as of railway cuttings, a horizontal or base line is drawn, on which are laid off the stations or distances at which levels have been taken; at these points perpendiculars or ordinates are erected, and upon them are marked the heights of ground above base, and the marks are joined by straight lines. To express rock in a cut, it is generally represented by parallel inclined lines; rivers by horizontal lines, or better colored in blue; the depth of sounding in a mud bottom by a mass of dots. Since it would be in general impossible to express the variations of the surface of the ground in the same scale as that adopted for the plan, it is usual to make the vertical scale larger than that of the horizontal lines in the proportion of 10 or 20 to 1.—Topographical features are represented as effectively by the brush and water colors as by the pen. Colors

are used conventionally. Thus, in the practice of the French military engineers, woods are represented by yellow gamboge with a very little indigo; grass land green, gamboge and indigo; cultivated land brown, lake, gamboge, and a little India ink or burnt sienna, adjoining fields being slightly varied in tint; gardens, by patches of green and brown; uncultivated land, marbled green and light brown; brush, brambles, &c., marbled green and yellow; vineyards, purple; sands, a light brown; lakes and rivers, a light blue; seas, a dark blue, with a little yellow added; roads, brown; hills, greenish brown. In addition to the conventional colors, a sort of imitation of the conventional signs already explained is introduced with the brush, and shadows are almost invariably introduced. Topographical drawings receive the light, the same as architectural and mechanical drawings, from the upper left-hand corner. Hills are shaded, not as they would appear in nature, but on the conventional system of making the slopes darker in proportion to their steepness, the summit of the highest ranges being left white. Topographical drawings embrace but a small portion of surface, and are therefore plotted directly from measures; but in geographical maps, embracing at times a great extent of country, various projections are made use of to express as nearly as possible a spherical surface upon a plane. These species of projection are generally included under the head of mapping.

DRAYTON, Michael, an English poet, born in Hartshill, Warwickshire, in 1563, died in 1631. His life is involved in obscurity, and various unauthentic accounts of him are given. He is supposed to have studied at Cambridge. In 1626 he was poet laureate. He found patrons in Sir Walter Aston and the earl of Dorset, but he never became wealthy or powerful, though respected for his virtues and talent. It is not easy to discover the order of his various poems, some of which were published without date. The best known is his "Polyolbion," a descriptive poem on England, her legends, antiquities, and productions, the first 18 books of which were published in 1613, and the whole 30 in 1622. Among his other works are "The Harmony of the Church, containing the spiritual Songs and holy Hymns of godly Men, Patriarchs, and Prophets" (4to, 1591, only one copy of which edition is known to exist; and 8vo, London, 1843; edited by Dyce); "Idea, the Shepherd's Garland, and Rowland's Sacrifice to the Nine Muses" (4to, 1593), the second of which was reissued under the title of "Pastorals," "Mortimeriados" (4to, 1596), reprinted under the title of "The Barons' Wars;" "England's Heroical Epistles" (8vo, 1598); "The Legend of Great Cromwell" (4to, 1607); "Ballad of Agincourt" (folio, 1627); "The Muses' Elysium" (4to, 1630); numerous legends, sonnets, &c., mostly printed in collections; and "Nymphidia, the Court of Fairy," edited by Sir E. Brydges (Kent, 1814). The last is one of his most admirable productions. His historical poems are dignified, full of fine descriptions, and rich in true poetic spirit, and his "Polyolbion" is moreover so accurate as to be quoted as authority by antiquaries. Notes to the first portion of it were written by Selden. He was buried in Westminster abbey, where a monument was erected to his memory. An edition of his works, with a historical essay on his life and writings, was published in 1752-'3 (4 vols. 8vo, London).

DRAYTON, William Henry, an American statesman, born at Drayton hall, on Ashley river, S. C., in September, 1742, died in Philadelphia in September, 1779. He was educated in England at Westminster school, and at Balliol college, Oxford. Returning to America in 1764, he became an active writer on political affairs, on the side of the government. In 1771, after revisiting England, he was appointed privy councillor for the province of South Carolina; but as the revolutionary crisis approached he espoused the popular cause. In 1774 he was appointed judge of the province, and when the continental congress was about to sit he published a pamphlet under the signature of "A Freeman," which substantially marked out the line of conduct pursued by that body. Suspended from his offices under the crown, he was made a member of the popular committee of safety, and was prominent in advising the seizure of the provincial arsenals and British mails. In 1775 he was president of the pro-

vincial congress, and in 1776 was elected chief justice of South Carolina. He soon after delivered a charge to the grand jury on the question of independence, which was published throughout the colonies and had great influence. He had produced several other political charges and pamphlets, when in 1778 he was elected a delegate to the continental congress, of which he was a prominent member till his death. He left a minute narrative of the preliminary and current events of the revolution, which was prepared for the press and published by his son, Gov. John Drayton (2 vols. 8vo, Charleston, 1821).

DREAM, the thoughts or series of thoughts which occupy the mind during sleep. Locke expresses the opinion that we do not always think when we sleep; but most modern philosophers, following Plato and the Platonists, are agreed that the mind is never dormant, but that consciousness continues uninterruptedly during sleep. Leibnitz rejects Locke's position, and Kant maintains that we always dream when asleep; that to cease to dream would be to cease to live, and that those who fancy they have not dreamed have only forgotten their dream. Sir William Hamilton argues that the mind is never wholly inactive, and that we are never entirely unconscious of its activity. He quotes from Jouffroy as follows: "I have never well understood those who admit that in sleep the mind is dormant. When we dream, we are assuredly asleep, and assuredly also our mind is not asleep, because it thinks; it is therefore manifest that the mind frequently wakes when the senses are in slumber. But this does not prove that it never sleeps along with them. To sleep is for the mind not to dream; and it is impossible to establish the fact that there are in sleep moments in which the mind does not dream. To have no recollection of our dreams does not prove that we have not dreamed; for it can often be proved that we have dreamed, although the dream has left no trace on our memory." Dreams, no less than our waking thoughts, are dependent on the laws of association, and the senses may be considered as the media through which the spirit within is brought into contact with the external world. Although in sleep the senses generally are torpid, some of them continue to transmit to the mind imperfect sensations which they receive. Of the five external senses, sight is the least excitable during sleep; and next in order, in proportion to their degree of excitability, come taste, smell, hearing, and touch; the last being the most excitable, and causing or modifying dreams oftener than any of the others. Dr. Gregory, having applied a bottle of hot water to his feet on going to bed, dreamed that he was making a journey to Mount Etna, and found the heat insufferable. Dr. Reid, having had a blister put upon his head, dreamed that he was scalped by Indians. M. Giron de Buzereingues made a series of experiments to test how far he could determine

his dreams at will by operating upon the mind through the senses. With this view he left his knees uncovered, and dreamed that he was travelling at night in a diligence with a vivid impression of cold knees produced by the rigor of the weather. Waller relates the case of a gentleman who was a victim of terror on account of a dream, which he could never look upon except as a real occurrence. He was lying in bed, and as he imagined quite awake, when he felt the distinct impression of a hand placed upon his shoulder, which produced such a state of alarm that he durst not move in bed. The shoulder which had experienced the impression had been uncovered, and the cold to which it was exposed produced the sensation. Persons in whom one of the senses is defective frequently have their dreams modified by this circumstance. Darwin relates the case of a deaf gentleman who in his dreams always appeared to converse by means of the fingers or in writing. He never had the impression of hearing speech, and for the same reason one who has been blind from his birth never dreams of visible objects. The condition of the digestive apparatus has a very marked influence on dreams. When the functions of the digestive organs are properly performed, the dreams, if affected at all from this cause, are pleasant; if however any disturbance exists in this part of the system, the dreams are apt to be painful, usually proportioned in intensity to the amount of disturbance of the alimentary canal. To this class of sensations may be referred those dreams produced by the use of opium and intoxicating drinks, which in part at least act by the impression made upon the digestive organs. Dreams induced by this cause are remarkable for the extravagance of the phantasmagoria they exhibit, frequently presenting shapes the most fugitive and fanciful. The dreamer often seems endowed with such elasticity that it appears as if he could easily mount to and float upon the clouds above him. De Quincey, in the "Confessions of an Opium Eater," has portrayed most vividly the effects of that narcotic in the production of dreams. But it does not require the aid of a narcotic as powerful as opium, or indeed anything beyond what ordinarily occurs in a state of dreaming, to create ideas of time and space apparently as incongruous as those narrated by the opium eater. The sleeper who is suddenly awakened by a loud rap does not begin and terminate his dream with this simple occurrence, but experiences a long train of events requiring hours and even days for their fulfilment, all evidently occasioned by the sound which awakens him, and concentrated within the brief space of time it occupies. A person who was suddenly aroused from sleep by a few drops of water sprinkled in his face, dreamed of the events of an entire life in which happiness and sorrow were mingled, and which finally terminated with an altercation upon the borders of a lake, into which his exasperated

companion, after a considerable struggle, succeeded in plunging him. It is evident that the association of ideas in this case which produced the lake, the altercation, and the sudden plunge, was occasioned by the water sprinkled upon the face, and the presumption is probable that the whole machinery of an entire life was due to the same cause. Dr. Abercrombie relates a similar case of a gentleman who dreamed that he had enlisted as a soldier, joined his regiment, deserted, was apprehended, carried back, tried, condemned to be shot, and led out to execution. After the usual preparations a gun was fired, and he awoke with the report to discover that the cause of his disturbance was a noise in the adjacent room. Kant says we can dream more in a minute than we can act during a day, and that the great rapidity of the train of thought in sleep is one of the principal causes why we do not always recollect what we dream. Dreams are often produced by the waking associations which precede them; and the most recent associations occur the most frequently in our dreams. So, too, dreams are often characteristic of the peculiar idiosyncrasies of the dreamers: a miser dreams of his gold, a philosopher of science, a merchant of his ventures, the musician of melody, and the lover of his mistress. Tartini, a distinguished violin player, is said to have composed his "Devil's Sonata" under the inspiration of a dream, in which the devil appeared to him and invited him to a trial of skill upon his own instrument, which he accepted, and awoke with the music of the sonata so vividly impressed upon his mind that he had no difficulty in committing it to paper. In like manner Coleridge professes to have composed his poem "Kubla Khan" in a dream. He had, he says, taken an anodyne prescribed for a slight indisposition, and fell asleep in his chair while reading in Purchas's "Pilgrimage" of a palace built by Khan Kubla. He continued for about three hours in a profound sleep, and awoke with a vivid impression that he had composed from 200 to 300 lines of verse. He at once wrote the fragment as it is now preserved. At this point he was called out to attend to some business. When he returned, after an absence of more than an hour, the poem, with the exception of a few scattered lines and images, had vanished from his memory. Instances like the above occasionally occur where the mind in a state of waking is aided by the processes carried on during sleep. Condillac, says Cabanis, often brought to a conclusion in his dreams reasonings which he had not completely worked out on retiring to bed; and Condorcet saw in dreams the final steps of a calculation which had baffled him when awake. But such cases are rare. As a general rule dreams are wanting in coherence and unsubstantial in reasoning. Nothing is more common than for the mind in dreams to blend together objects and events which could not have an associated existence in reality. We never dream of a past

event as past. The faces of friends long dead and events long past rise before the mind with all the vividness of real existence, and fail to excite surprise by their incongruity, because, says Dr. Hartley, "we have no other reality to oppose to the ideas which offer themselves, whereas in the common fictions of the fancy, while we are awake, there is always a set of real external objects striking some of our senses and precluding a like mistake there. . . . Secondly, the trains of visible ideas which occur in dreams are far more vivid than common visible ideas, and therefore may the more easily be taken for actual impressions."—The popular belief that in dreams an insight is frequently given of coming events is shared by many well informed persons, and is supposed to be corroborated by many remarkable cases. Some of the instances recorded may be explained by natural means. Franklin believed that he was instructed supernaturally in his dreams concerning the issue of current events. "He observed not," says Cabanis, "that his profound skill and rare sagacity continued to direct the action of his brain during sleep." The dream of Albumaron, the Arabian physician, to whom his lately deceased friend suggested in his sleep "a very sovereign remedy for his sore eyes," is explicable in a similar way. But there are extraordinary instances which cannot be explained by any known natural laws. Many of these are so well authenticated that they cannot be discredited, however loath we may be to accord to them a supernatural origin.—The earliest mention of dreams is in the Scriptures and in the poems of Homer, in both of which a supernatural origin is generally ascribed to them. By the ancients, indeed, dreams were almost universally regarded as coming from the other world, and from both good and evil sources. A great number of instances are on record in the Greek and Latin classics of remarkable dreams. The night before the assassination of Julius Cæsar, his wife Calpurnia dreamed that her husband fell bleeding across her knees. On the night that Attila died, the emperor Marcian at Constantinople dreamed that he saw the bow of the Hunnish conqueror broken asunder. Cicero relates a story of two Arcadians, who, travelling together, arrived at Megara and went to separate lodgings, one to an inn, the other to a private house. In the course of the night the latter dreamed that his friend appeared to him and begged for help because the innkeeper was preparing to murder him. The dreamer awoke, but, not considering the matter worthy of attention, went to sleep again. A second time his friend appeared, telling him that assistance would be too late, for the murder had already been committed. The murdered person also said that his body had been put into a cart and covered with manure, and that an attempt would be made to take it out of the city the next morning. The dreamer went to the magistrates and had the cart searched,

when the body was found and the murderer brought to justice. Dreams were even allowed to influence legislation. During the Marsic war (90 B. C.) the Roman senate ordered the temple of Juno Sospita to be rebuilt in consequence of a dream of Cæcilia Metella, the wife of the consul Appius Claudius Pulcher. Some of the fathers of the Christian church attached considerable importance to dreams. Tertullian thought they came from God as one species of prophecy, though many dreams may be attributed to the agency of demons. He believed that future honors and dignities, medical remedies, thefts, and treasures had been occasionally revealed by dreams. St. Augustine relates a dream by which Gennadius, a Carthaginian physician, was convinced of the immortality of the soul, by the apparition to him in his sleep of a young man, who reasoned with him on the subject, and argued that as he could see when his bodily eyes were closed in sleep, so he would find that when his bodily senses were extinct in death he would see and hear and feel with the senses of his spirit.—Aristotle wrote a treatise on dreams (*Περὶ ὄντων*), as did also Artemidorus and Astrampsychus. Of late works, Dr. W. B. Carpenter's "Physiology" may be consulted with advantage; also Maury's *Le sommeil et les rêves* (Paris, 1861); Brierre de Boismont's *Des hallucinations, ou histoire raisonnée des apparitions, des visions, des songes, de l'extase, des rêves, du magnétisme et du somnambulisme* (Paris, 3d ed., 1861); and Maudsley's "Physiology and Pathology of the Mind" (London, 1867).

DREBBEL, Cornelis van, a Dutch philosopher and inventor, born in Alkmaar in 1572, died in London in 1634. Of his life little is known; but his inventive genius appears to have given him a wide reputation, for it is certain that when about 30 years of age he was in receipt of a pension from the emperor Rudolph II., granted him for scientific discoveries. He was also taken into favor by the future emperor Ferdinand II., and made tutor to his son. Seditious movements about the beginning of the thirty years' war led to his arrest; and he would have been executed but for the intercession of King James I. of England, who took him under his protection. He lived in London from 1620, devoted entirely to scientific labors. He invented several philosophical instruments, among which, it is said, were the compound microscope and a thermometer consisting of a glass tube containing water connected with a bulb containing air. His contemporaries say that he displayed to King James a glass globe in which by means of the four elements he had produced perpetual motion, and that by means of machinery he imitated rain, thunder, lightning, and cold, and was able quickly to exhaust a river or lake. He discovered a bright scarlet dye for woollens and silks, which was introduced into France by the founders of the Gobelins manufactures.

Drebbel left two treatises, which appeared first in Dutch (Leyden, 1608); afterward in Latin, under the title *Tractatus duo: De Natura Elementorum; De Quinta Essentia* (Hamburg, 1621); and in French (Paris, 1673).

DREDGING, the process of excavating the sediment that collects in harbors and channels; the term is also applied to the scooping up of oysters, or anything else, from the bottom. The drainage waters and even the ebb tide have sometimes been held back by floodgates, and the waters at last let out have rushed with great violence through the channels, sweeping forward the materials that obstructed them. This is the principle of flashing or flushing applied to sewers, and is the most efficient mode of dredging. In some of the harbors in England scouring basins have been constructed especially for this purpose, as at Ramsgate and Dover. To loosen the sediment, the Dutch long since contrived a floating frame to which bars were attached, that went down to the bottom and stirred up the mud, as the machine moved along with the current. These are perhaps the oldest dredg-

FIG. 1.

ing machines. The dredging machine now generally used for deepening channels and harbors is an endless chain with scoop buckets, placed in a frame which may be raised or lowered through a well in the middle of the scow upon which the apparatus and the machinery for moving it are placed. The diagram, fig. 1, will afford an idea of the general principles of its construction and use. The mud may be received in a shoot, and conveyed to an adjoining scow, or the frame may be made long enough to reach beyond the side of the vessel, and discharge itself without the intervention of the shoot. Another kind of dredging machine, which is used in soft bottoms, especially where old piles remain that would interfere with the working of the endless chain and scoops, is shown in fig. 2. It is a very efficient form, sinking into the mud and filling itself readily, and is strong enough to draw old piles from their beds. The same form of dredge on a smaller scale, usually worked by hand by means of a windlass, although sometimes by steam power, is used for

dredging for oysters in their natural beds. A smaller kind, usually called tongs, is used to gather oysters from artificial beds. It is constructed by placing two rakes, having iron

FIG. 2.

heads and long wooden handles, with their teeth turned toward each other, and uniting them by a hinge like that in a blacksmith's tongs or a pair of shears.

DREDGING, Deep-Sea, an operation much resorted to by modern naturalists to investigate the bottom of the sea and its inhabitants. It has added vastly to our knowledge of the animal kingdom in general, of its distribution in depth, and of the important part it plays in the formation of the superficial layers of the earth. The first naturalist who appears to have made use of the dredge was Otto Frederik Müller, a Danish zoölogist of the last century, who obtained by its means a large portion of the specimens described by him and figured so beautifully by his brother in the *Zoologia Danica*. The description of his *sacculus reticularis*, as he calls it, and of the alternate joys and disappointments of the dredge, is very amusing. A small figure of the instrument is given among the allegorical ornaments of the title page, and has been reproduced in Thomson's "Depths of the Sea." That same dredge was afterward purchased by Tilesius, the naturalist who accompanied Krusenstern in his journey round the world, and after his return it was deposited in the academy of St. Petersburg. It consisted of a square frame, each side being in the shape of a scraper. A bag of netting was attached to it, and four iron arms were hinged at the corners and met in a ring to which the rope was attached. Little was heard of dredging after Müller's time until about 1838, when Dr. Robert Ball of Dublin introduced the modern dredge, commonly known as Ball's dredge. This is oblong, with only two scrapers and two arms. For dredging from a rowboat 18 in. by 5 is a convenient size. The scrapers may be

3 or 4 in. wide, sharp at the forward edge, and pierced with holes at their hinder and thicker edge. To these holes the net, made of strong twine, and a protecting cover of canvas open at the bottom, are fastened with copper wire. The iron rings passing through the holes in the frame, and the iron rod running through the rings as used in recent English expeditions, appear to be unnecessary complications. The net ought to have small meshes, about half an inch to the side, and may be lined near the bottom with some open canvas to retain the smaller specimens. In the United States coast survey dredgings it was found convenient to have the net open at the bottom and to tie it up with a rope yarn; this gives greater facility for emptying it, and the numerous folds formed in the bottom of the bag have a great retentive power for small objects. A stout wire bent in a bow inside the net, and hooked by its ends to the frame, is useful in preventing the net from being turned inside out in going down. The bag has also been made occasionally of strong canvas, with windows of copper or brass wire gauze on each side; but this construction seems to afford too much facility for washing out, unless the bag is of considerable length. Dredges have also been made of two sides of hide, laced all round with a small line; this works well on coral ground, but not elsewhere. Some of the Scandinavian and German naturalists use triangular dredges, having three scrapers and three arms. The two arms of an ordinary dredge are made each of a double or forked rod of iron, hinged on the small ends of the frame, and forming a ring at the outer end. The dredge rope passes through the ring of one of the arms only, the other arm being made fast or stopped to the first by a few turns of spun yarn. By this arrangement, in case the dredge is caught, the stop, being the weakest part, breaks first, and the rope pulling on one arm only, the dredge disengages itself and comes up endwise. For use from a steamer the dimensions of the dredge may be larger. Those used in the Porcupine expedition were 4 ft. 6 in. long by 6 in. wide. Capt. Calver of the Porcupine, having observed that frequently objects came up adhering to the outside of the bag and even to the line, attached to the dredges some of the swabs used for washing decks. The frayed hemp swept up every rough or spiny object with which it came in contact; and among the dwellers of the deep, crustacea, bryozoa, echinoderms, polyps, and sponges nearly all partake of those qualities. Smooth shells, and those which burrow in the sand, alone escape the "hempen tangles." In one case Prof. W. Thomson estimates that not fewer than 20,000 specimens of *echinus Norvegicus* came up in the tangles at one haul. These are best attached to an iron bar fixed transversely to the bottom of the bag, or in very rocky bottom they can be used without the dredge. In the expedition of the United States steamer Hassler they were successfully

used attached to a long bundle of rattans, which yields when in contact with rocks, and adapts itself to the inequalities of the bottom; it is of course loaded sufficiently with lead. The *salabre* of the coral fishers of the Mediterranean is constructed on the same principle. It is a heavy wooden cross, carrying at the end of the arms large bunches of old tattered nets and swabs. It is kept horizontal, and lifted and dropped alternately a number of times, thus breaking off the branches of coral which are entangled in the nets. In the recent expedition of the British ship Challenger it was found practicable to use in great depths the trawl net, with which European fishermen procure fishes living close to the bottom. It consists of a wooden beam 12 to 15 ft. long, provided at the ends with iron supports like the runners of a sled, which keep it one or two feet from the ground. A large bag net is laced to the beam by one edge of its mouth, while the other, kept down by leaden sinkers, drags on the ground. Besides fishes, many crustaceans can be procured with it, which either swim close to the bottom or rise from the sand at the approach of the beam. A miniature trawl net is used by some naturalists in small depths for the lesser crustacea or radiata, the bag being made of bunting and the frame of hoop iron. The rope or line used in dredging must be made of the best materials, Russian or Italian hemp, and of a size to resist at times a very heavy strain. The deeper the dredge is to be used, the stronger the line must be. In the Porcupine, lines from 2 to 2½ in. in circumference were used, the latter having a breaking strain of 2½ tons. In the United States coast survey, lines from 1½ to 2 in., of Italian hemp, were mostly used. In dredging from a boat or a yacht depths from 100 to 200 fathoms can be reached. If the boat drifts considerably by the effect of the wind or current, it is necessary, unless the dredge is very heavy, to attach a lead to the line a few fathoms above the dredge; otherwise it is apt to be lifted clear of the bottom. The length of the line paid out is usually about twice the depth.—Deep-sea dredging, that is, dredging in more than 200 fathoms, necessitates the use of a steamer and of a donkey engine to bring up the dredge. The line passes over a large block suspended from a derrick or boom. The rope to which this block is attached passes through another block or a bull's-eye, and thence through an accumulator to the deck, where it is made fast. This accumulator is a combination of 30 or 40 strong India-rubber springs held apart by two wooden disks, and is very useful in indicating the strain on the line, which when too great can be relieved by a few turns of the engine. The line (which is marked for every hundred fathoms in the manner of a sounding line) is conveniently coiled in succession on a row of large iron pins projecting inward from the top of the bulwark. On board the Hassler stout

hooks of galvanized iron were hinged inside the bulwark in such a way that they could be turned flat against the latter when not in use. It is not usually practicable to pay out so large a surplus of line in deep casts as in more moderate ones. It is therefore well to attach a heavy weight to the line at a considerable distance above the dredge, say a fifth or a sixth of the depth; thus the traction on the dredge will be nearly horizontal. Another good practice in very deep casts is to steam slowly to windward during the descent of the dredge until the dredge rope is nearly perpendicular, and then let the vessel drift with the wind or current. The motion is thus communicated to the weight from the vessel, and the dredging performed as if from that and not from the latter. The contents of the dredge will generally be found to consist of mud or sand, out of which the specimens are to be sorted. For this a graduated set of sieves is used, constructed so as to fit in one another, the coarsest on top. The mud being placed in the latter, the whole set is moved up and down in a tub of water, after which the specimens can be selected with ease. The best mode of preserving them is to put them in alcohol, the more delicate ones in bottles, the coarser ones in bags of muslin or bunting, which can be accumulated in larger vessels. Some very delicate objects, which are liable to lose their shape in pure alcohol, can be preserved successfully in a mixture of alcohol and glycerine. Superfluous duplicates of mollusks, crustacea, echinoderms, corals, and sponges can be preserved by drying. Care must be taken not to place colored horny sponges in the same vessel with other specimens, as they are apt to stain everything as with ink. Abundant samples of the sand or mud ought to be preserved, as they afford an immense variety of microscopical specimens of great value.—An erroneous opinion prevails that the late American and English expeditions first revealed the existence of an abundant deep-sea fauna. The late Edward Forbes asserted that life becomes less and less as we descend, until it is almost or utterly extinguished. Guided by his own researches in the Mediterranean, he placed the limit of life at the very moderate depth of 200 to 300 fathoms. Norwegian fishermen, from time immemorial, have taken certain fishes in depths of 100 to 300 fathoms. Some of these are quite large, as the halibut and the ling, and some have never been obtained in lesser depths. On the coast of Portugal also the fishermen of Setubal fish in similar depths for a peculiar shark, using lines of 500 fathoms. It is evident that where such fishes can live they must find abundant food, and this was proved by the contents of their stomachs, and by the specimens occasionally brought up on the hooks, but mostly rejected with superstitious dread by the fishermen. The Scandinavian naturalists Lovén, Sars, Danielssen, Koren, and others, made extensive researches by means of the dredge in depths of 200 to 300 fathoms,

bringing to light a great variety of animal forms peculiar to that region. Sir John Ross relates in his "Voyage," published in 1819, that in the preceding year he obtained a sounding in Baffin Bay in 1,000 fathoms, and brought up with the lead mud containing worms, and a living star fish (*astrophyton*) attached to the line. Sir James C. Ross, in his voyage to the antarctic regions in 1839-'43, obtained with the dredge in 270 fathoms "an abundance and great variety of animal life." He says: "Contrary to the general belief of naturalists, I have no doubt that from however great a depth we may be able to bring up the mud and stones of the bed of the ocean, we shall find them teeming with animal life. The extreme pressure at the greatest depth does not appear to affect these creatures; hitherto we have not been able to determine this point beyond 1,000 fathoms, but from that depth several small fish have been brought up with the mud." At a later time evidences of the existence of animal life at great depths began to accumulate. Ehrenberg showed in 1851 that foraminifera from a depth of 2,000 fathoms still contained unchanged animal matter. Prof. Bailey of West Point confirmed these observations, although differing in the explanation of the fact. In 1853 the soundings of the United States coast survey revealed for the first time the great foraminifera bed which almost unmixed covers a large extent of the ocean floor. In a sample of scarcely two cubic inches, from a depth of 510 fathoms, Mr. Pourtales found specimens or recognizable fragments of at least 48 species, 20 of them mollusks. Dr. Wallich, accompanying the sounding expedition of Sir L. McClintock to Greenland, obtained living animals from depths of 1,000 to 2,500 fathoms, among them star fishes of considerable size. Doubt was still thrown on these results from the fact that some foraminifera are found floating near the surface, and it was even objected that the star fishes might have been swimming when entangled in the line. No such objections could be made to the observations of Dr. Allman and A. Milne-Edwards, who found oysters and other shellfish, worms, and corals on a telegraph cable raised from a depth of 1,000 to 1,400 fathoms in the Mediterranean; or to the results of the Swedish expedition to Spitzbergen, under Thorell, who obtained, partly by dredging and partly by means of the Bulldog machine, extensive collections from depths down to 1,400 fathoms. In 1868 Prof. Sars of Christiania published a list of 427 species of animals living in depths of 200 to 300 and even as much as 450 fathoms. In the United States, dredging up to a recent date has received but little attention. The most successful worker in that field has been the late Dr. W. Stimpson, who however confined himself to quite moderate depths. In 1867 Professor Peirce, superintendent of the coast survey, commissioned Mr. Pourtales, one of his assistants, to make some dredgings in connection with the sounding out

of a track for the submarine telegraph between Key West, Florida, and Havana. Although but a few casts were obtained in that year, and the depths reached did not exceed 500 fathoms, the results were so promising that dredgings were carried out systematically over the region comprised between the Florida reef and the axis of the straits of Florida, with occasional extensions to the coast of Cuba and the Bahama banks, during the two following years. This is probably at this time the only example of a connected dredging survey of a defined submarine region. The results established several well defined zones characterized by peculiar fauna, the animals comprising them being generally new discoveries, or in several cases known only from high northern latitudes, thus bearing out in part Lovén's theory that beyond a certain depth the ocean is peopled by a fauna extending from pole to pole. In these explorations the greatest depths reached were about 700 fathoms. One of the most notable examples of an animal found in Florida and off the northern coast of Norway is the little crinoid *rhizocrinus Lofottensis*, discovered the year previous by Sars. This seems to have been one of the principal incentives in determining the fitting out of the deep-sea dredging expeditions of the Lightning and Porcupine by the British government, under the direction of Profs. W. Thomson and W. B. Carpenter. The first cruise in the Lightning was made in 1868, between the British and the Faroe islands, with very promising results. The next year the Porcupine was employed on the same service, off the W. and S. W. coasts of Ireland. The depth of 2,435 fathoms was attained by the dredge, which brought up quite a variety of living animals, ranging from mollusks and crustacea downward. During the following summer the same researches were extended across the bay of Biscay, along the coast of Portugal, and into the Mediterranean, with great success generally, though in the latter sea the greater depths were found singularly barren, probably on account of the want of circulation in the water. (See ATLANTIC OCEAN.) The British government was induced by the general interest which these researches had created to fit out a large ship, the Challenger, for a cruise of deep-sea exploration on a large scale, which in 1872 started, under the scientific leadership of Prof. W. Thomson, on a voyage of circumnavigation. In the earlier part of the voyage, in the Atlantic, the dredge was used with success in the depth of 3,895 fathoms. A few deep-sea casts were also made during the voyage of the United States steamer Hassler from Boston to San Francisco in 1872, but did not attain so great a depth. In 1871 the United States fishery commission, directed by Prof. S. F. Baird, made extensive explorations of the sea bottom on the coast of New England, Prof. Verrill and Dr. Packard having charge of the dredging operations. Deep-sea dredgings were

made off St. George's bank and in the gulfs of Maine comprised between Cape Cod and Cape Sable. The fauna, as might have been expected, was entirely arctic, with the exception of a single specimen of a small coral, *deltoceyathus*, a West Indian deep-sea form, the presence of which north of Florida had not been detected before.—Dredging in deep water has greatly increased our knowledge of the animal world, and precisely at a time when the need of such a knowledge is most keenly felt. The great bed of foraminifera has already been mentioned. A gelatinous matter pervades this bed in most localities, which under the microscope seems to be endowed with a kind of motion or change of form, and has thence been raised to the dignity of a living organism under the name of *bathylbius Hæckelii* by Huxley. Its nature is really as yet but imperfectly understood. The same may be said of small calcareous bodies which have been named coccoliths. (See BATHYBIUS, and COCCOLITHS AND COCCOSPHERES.) The sponges are represented by a number of forms, having generally a beautiful silicious skeleton. Then come a considerable number of small corals, generally simple. The echinoderms are abundant and peculiar; among them the most notable are the crinoids. The *rhizocrinus Lofottensis* has been found in the straits of Florida and in the seas of Europe. Another species has been recently discovered in the West Indies by the Hassler expedition, in company with two species of *pentacrinus* and the remarkable *holopus*. Another *pentacrinus* and *bathyrinus gracilis* belong to the European seas. The sea urchins or *echinidæ* of great depths are very remarkable, and among them several genera are represented much more nearly related to forms of the cretaceous or early tertiary period than to any recent ones. Of the mollusks we know less than of the other classes; partly because the collections of the American dredging expeditions were lost in the great fire of Chicago, and partly because the English collections have not yet been fully worked up. What we know at present points to the same conclusions as derived from other branches of the animal kingdom.—Deep-sea researches are also extending the science of geology, particularly as it refers to sedimentary rocks. The dredgings off the Florida reef brought up large fragments of limestone rock in process of formation, and of different grades of compactness, formed by the various mollusks, bryozoa, serpulæ, corals, foraminifera, &c., still living on its surface. On other parts of our southern coast we have the beds of foraminifera gradually undergoing transformation into glauconite or greensand, such as we find in the tertiary formation of New Jersey. This process, as yet unexplained, takes place in comparatively limited localities, while the great bed of foraminifera becomes compacted without alteration into a formation almost identical with the white chalk; and the continuity of that formation

to the present time has been advocated by Huxley, Thomson, and others. A considerable proportion of the deep-sea foraminifera are undistinguishable specifically from those of the chalk; but all the higher forms inhabiting the deep sea, polyps, echinoderms, crustacea, and mollusks, are with one or two doubtful exceptions only generically related to those of the cretaceous and tertiary periods. It may here be remarked that but little distinction has heretofore been made by geologists between formations deposited in deep and in shallow water, and that we are unduly struck by resemblances brought up suddenly before our eyes by the revelations of the dredge. Deductions will therefore not be safe until we acquire a fuller knowledge of the bathymetrical relations of fossil forms, so that we can compare those of a particular level with those of the corresponding level of the present seas.

DRELINCOURT, Charles, a French Protestant divine, born at Sedan, July 10, 1595, died in Paris, Nov. 3, 1669. He pursued his studies in his native town and in Samur, preached for two years near Langres, and in 1620 became pastor at Charenton, near Paris. He soon distinguished himself as a preacher, being one of the first of the reformed ministry who treated their texts practically, instead of discussing them in a doctrinal and abstract way. Some of his writings, especially his book of "Consolations against the Fear of Death" (Paris, 1651), which has been translated into English and German, are still in use as books of devotion. It was to promote the sale of the English translation of this work that Defoe wrote his celebrated fictitious account of the apparition of Mrs. Veal, who came from the other world on purpose to recommend the perusal of "Drelincourt on Death."

DRENTHE, a N. E. province of the Netherlands, bordering on the Prussian province of Hanover and the provinces of Groningen, Friesland, and Overijssel; area, 1,031 sq. m.; pop. in 1871, 108,056. It lies on each side of the watershed between the Zuyder Zee and the Dollart, and its surface is generally more elevated than that of the surrounding provinces. Several streams rise within it, the principal of which are the Hunse and the Drentsche Aa, and there are a number of small lakes. The soil is poor and sandy, and only about half of it is capable of cultivation; the remainder consists of heaths, bogs, marshes, and sand wastes. The chief industry is the breeding of horses, which are sent as foals into Friesland to be reared. Cattle, sheep, swine, and poultry of fine quality are also raised. On the western border are the colonies of Willemsoord and Frederiksoord, where large numbers of paupers are employed in brick-making, spinning, weaving, tanning, cutting peat, reclaiming waste lands, &c. Assen, the capital, is connected with Meppel, the chief town, by canal and railway. In the south part of the province is the strong fortress of Koeverden.

DRESDEN, the fourth city of the German empire in point of population, capital of the kingdom of Saxony and of a circle of its own name, in lat. 51° 3' N., lon. 13° 44' E., 99 m. S. by E. of Berlin and 61 m. S. E. of Leipsic, lying on both sides of the Elbe, in the midst of a fertile valley, and in the neighborhood of the most picturesque scenery of the kingdom; area of the circle, 1,627 sq. m.; pop. of the circle in 1871, 677,671; pop. of the city, 177,089, nine tenths Lutherans. The city consists of four portions, viz.: the Altstadt with its three suburbs (the Pirnaische Vorstadt, See-Vorstadt, and Wilsdruffer-Vorstadt), on the left bank of the Elbe; the Friedrichstadt, separated from the Altstadt by the narrow channel of a small stream, the Weisseritz; the Neustadt, on the right bank of the Elbe; and the Antonstadt, lying E. of the Neustadt on the same side of the river. The village of Stadt-Neudorf has recently been incorporated with the Neustadt; and the private purchase of large tracts of the public lands lying north of the former limits has also added somewhat to the extent of the city, which now contains, besides its public buildings, about 6,000 houses and 300 streets, and about 30 squares and places. The chief thoroughfares are the Schloss, Prager, See, Pirnaische, and Wilsdruffer streets, in the Altstadt and its suburbs; the Weisseritz and Schäfer streets, in the Friedrichstadt; the Hauptstrasse, the Leipziger and Grosse Meissner streets, in the Neustadt; and the Bautzner, Anton, and Schiller streets, in the Antonstadt. The chief squares in that part of the city on the left bank of the Elbe are the Altmarkt and Neumarkt, the Schlossplatz, Theaterplatz, Antonsplatz, and Wilsdrufferplatz; on the right bank, the Bautznerplatz, Neustädtermarkt, and Palaisplatz. Two bridges across the Elbe connect the various portions of the town. The Altbrücke, built entirely of stone, crosses from the Schlossplatz, which lies on the river at its abrupt bend in the centre of the city, to the Neustädtermarkt, and forms the most frequented passage from the old town to the new. It was constructed in the 13th century, renewed in the 14th, embellished in the 18th, and restored in 1814, after its partial destruction by the French in the preceding year. It is 1,420 ft. long, has 16 arches, and is of the most solid structure, having to resist the force of the spring freshets of the Elbe, which not infrequently rises during the time of melting ice 16 ft. in 24 hours, with a current of great violence. Jean Paul Richter called this bridge "the triumphal arch of Dresden" (*Dresdens Triumphbogen*). From its centre one of the best views of the city is obtained. Somewhat more than half a mile below this is the shorter Marienbrücke of 12 arches, over the Elbe just above the mouth of the Weisseritz. It is crossed by a railway connecting all the routes of railway travel to and from the city: the Leipzig and Silesian railways, the stations of which are in the Neustadt, with the Bohemian and

Freiberg railways, having their stations on the southern outskirts of the See-Vorstadt. A new bridge above the Altbrücke has been projected, and in 1871 the city authorities appropriated 300,000 thalers to its completion. Three small bridges across the Weisseritz connect the Friedrichstadt with the Altstadt.—Dresden is in appearance rather a pleasing and attractive than a striking or imposing city; yet it abounds in buildings of great architectural beauty, and its principal streets and promenades are laid out with much taste and skill. The principal public buildings of interest surround the Theaterplatz, which is thus, as well as by its situation near the river and the Altbrücke, made the centre of attraction in the old town. On that side of the square furthest from the Elbe is the Zwinger, an immense structure in the most elaborate rococo style of architecture, begun in 1711, and at

first designed to form only a portion of a still larger palace. For more than a century it occupied three sides of a square, the fourth, toward the Theaterplatz, remaining open; but in 1846 the so-called new museum was built across this space. The royal palace, an extensive, irregular building, was begun in 1534 by Duke George the Rich, but greatly enlarged and changed by his successors, so that it can hardly be said to follow any one system of construction. Its most conspicuous feature is a tower 370 ft. high. Near it is the smaller palace of the crown prince. A little to the north is the Catholic church, finished in 1756; its altarpiece is a painting by Raphael Mengs, "The Ascension," one of the most celebrated pictures in Dresden. The funeral vaults of the royal family of Saxony are underneath the sacristy. Near the northern end of the Theaterplatz, giving it its name, stood the royal

Dresden, from the right bank of the Elbe.

theatre till Sept. 21, 1869, when it was entirely destroyed by fire. It was built under the superintendence of the architect Semper in 1838-'41, thoroughly renovated in 1864, and was justly celebrated as one of the most beautiful theatres of Germany. A new building a little north of the former site is now (1874) in course of construction by the same architect. Besides those in the Theaterplatz, the Altstadt contains a considerable number of other prominent buildings. The Brühl palace, built in 1737 by the minister whose name it bears, and only separated by a garden in its rear from the Brühl terrace, a beautiful and well kept public promenade on the bank of the Elbe, served as the headquarters of the provisional government established in Dresden in 1813, as the meeting place of the Dresden conferences of 1850-'51, and more recently as the residence of the queen dowager of Saxony. It is an im-

posing building, but without great architectural beauty. Near it is the academy of fine arts (*Kunstakademie*). Further east, and near the Brühl garden at the end of the terrace, is the Zeughaus or arsenal, of which the most ancient part was built in 1559-'65, the addition in 1740. The post office and the polytechnic school are large and well arranged modern structures, at opposite ends of the Antonsplatz. The town hall, in the Altmarkt, is another conspicuous public building, but is without especially interesting architectural features. In the suburbs the chief buildings worthy of remark are the orangery, in the Wilsdruffer-Vorstadt, a massive structure with elaborate ornamentation; the large hospital in the Freiburgerstrasse; and the great railway station in the Wienerstrasse (See-Vorstadt). In the Neustadt, the Japanese palace, built by Augustus I. as a summer residence, but now used

as a museum, is the most important structure. It stands near the Elbe, in the midst of pleasant gardens, and not far distant from the Leipsic gate. The Dreikönigskirche, with a tower about 300 ft. in height, and the Catholic church, are conspicuous buildings. The most noteworthy of the public resorts of the citizens is the Grosser Garten, a beautifully laid out and carefully kept park a short distance outside the city. A zoological garden of considerable interest is also maintained by the government, and there are several smaller gardens of some beauty. There are comparatively few public monuments in Dresden. An equestrian statue of Augustus the Strong stands in the Neustädtermarkt; a fine drinking fountain, in the Gothic style, ornaments the Postplatz; and several statues embellish the steps of the public buildings. Four pieces of sculpture by Johannes Schilling, typifying morning, noon, evening, and night, have recently been placed on the Brühl terrace.—The art collections of Dresden enjoy a world-wide celebrity, and are among the finest in Europe. The great gallery of paintings in the museum contains some of the most valuable of existing works of art. Here are the Sistine Madonna of Raphael and Correggio's famous *Notte* (the night of the birth of Christ), with other works of both artists, and excellent specimens of the paintings of all the leaders of the great European schools. Titian, Andrea del Sarto, Paul Veronese, Giulio Romano, Guido Reni, Carlo Dolci, Leonardo da Vinci, and Annibale Carracci are among the Italian masters represented; Rubens, Van Dyke, Douw, and Teniers among the Dutch; and Nicolas Poussin and Claude Lorraine among the French. The gallery is remarkably well arranged, and is of course free to the public, being open every day from 9 till 4 o'clock. A very curious and valuable collection of objects of art and of rare jewels and relics is that of "the Green Vault" (*das grüne Gewölbe*), named from the place of its deposit in the long range of vaulted rooms on the ground floor of the royal palace. Here have been brought together some of the most costly treasures in the world: rare carvings, some by Michel Angelo, and beautiful specimens of workmanship in gold, silver, precious stones, amber, porcelain, enamel, ivory, and bronze. Immense sums have been spent upon this collection by the Saxon princes, especially by those of the last century, who were the purchasers and contributors of the costliest articles. In the Japanese palace there are collections of antique sculpture, coins, china, and pottery, and miscellaneous objects of artistic and historic interest; in the Zwinger there is a large and valuable museum of natural history. The royal public library is also in the Japanese palace. In some departments it excels almost all other German libraries, its historical works being especially numerous and noteworthy. It contains about 350,000 volumes, with nearly 200,000

pamphlets, and 3,000 manuscripts, besides about 2,000 incunabula. Other libraries are the *Secundogenitur-Bibliothek* (a library descending in the younger branch of the royal family), the library of the academy of medicine and surgery, and that of the natural history museum.—The educational institutions of Dresden are numerous. There are two gymnasia, a polytechnic school, a royal military academy (*Cadetthaus*), and many public and private schools, Protestant and Catholic, and of various grades. Among institutions for charitable or disciplinary purposes are the foundling asylum, orphan asylum, reform school for boys, the Pestalozzi institution (*Pestalozzistift*), the city hospital (400 beds), the Catholic hospital, and the asylum for deaf mutes and for the blind. The prosperous condition of the institutions of art and science in the city is largely attributable to the efforts of the numerous artistic and learned societies existing here. At the head of these are the royal academy of arts and the Leopold-Caroline academy of investigators in natural science (*Akademie der Naturforscher*). Political and trade societies are very numerous, and almost every branch of industry prominent in Dresden has its representation in one of these. The leading newspapers are the government organ, the *Dresdener Journal*, the *Constitutionelle Zeitung*, and the *Dresdener Anzeiger*.—The chief industries of Dresden are the manufacture of machinery (especially of agricultural machines of various kinds), mathematical and philosophical instruments, musical instruments, gold and silver wares, china, and porcelain, the preparation of leather, and the manufacture of leather goods. The favorable situation of the city with regard to the central region of northern Germany makes it the centre of a brisk trade, and the multitude of strangers constantly visiting the place largely contributes to its prosperity.—Dresden was founded about 1206, and attained importance so rapidly that in 1216 it was mentioned as a city in official documents, and soon after it was taken under the direct government of the margrave of Meissen, after having previously been under the rule of the Meissen bishopric, for many years one of the richest and most powerful in Germany. In 1270 Dresden became the margrave's residence, but for only one generation, as the city was sold to Wenceslas of Bohemia, and afterward to the margrave of Brandenburg. In 1319 it again came into the possession of the house of Meissen, then represented by Frederick the Bitten. In 1485, when the margraviate was divided, Dresden fell to the share of the margrave Albert, under whom it began to enjoy great prosperity. In 1491 it was almost entirely destroyed by fire; but it was immediately rebuilt with many great improvements. It was fortified in 1520–28, and the fortifications were strengthened and enlarged in 1547. In 1553 the city was paved and greatly improved by

the construction of new streets and buildings. A century later it was still further beautified through the erection of an opera house and other places of amusement, and through the laying out of the great garden. In 1686 that part of the town on the site of the present Neustadt was destroyed by fire; but it was rebuilt with very great improvements by Augustus I. in 1724. Under that prince and Augustus II. the city enjoyed perhaps its brightest period. The Friedrichstadt was founded by Augustus I. in 1730; new buildings and institutions were founded by both the kings; and the prosperity of Dresden was only checked by the seven years' war, during which another great fire swept away the Wilsdruffer-Vorstadt and the Pirnaische Vorstadt, and the whole city suffered greatly through the bombardment it endured in 1760. From the close of the seven years' war until the beginning of the present century it enjoyed a period of comparative peace, and had recovered much of its old beauty and prosperity when the wars of Napoleon subjected it to many evils, the chief of which was the constant quartering of large detachments of French troops within its walls; and 20,000 wounded were brought into the city after the battle of Bautzen. On Aug. 26, 1813, the French in Dresden were attacked by the allied armies, but Napoleon, by advancing large reinforcements, won on the 27th the battle that ensued (battle of Dresden). On Oct. 7 he left the city with the principal part of his army; the Russians soon after succeeded in surrounding the place, and the French garrison of 30,000 men left in it was compelled to surrender, Nov. 11. After the restoration of peace the fortifications of the city were removed, the work being completed in 1817. Many improvements were made under King Anthony, whose name was given to the Antonstadt. During the insurrection of September, 1830, Dresden was the centre of the agitation for constitutional government, and witnessed much disturbance. In the insurrectionary movements of May, 1849, it suffered from popular violence, streets and prominent buildings being injured by the insurgents. Measures were taken in 1874 for the removal of all military establishments to the outskirts of the city.

DREUX, a town of France, in the department of Eure-et-Loir, on the Blaise near its junction with the Eure, 20 m. N. by W. of Chartres; pop. in 1866, 7,237. It is situated in a pleasant valley commanded by a high hill, on which are the remains of the castle of the ancient counts of Dreux. The space within its walls is now a garden, in which stands the magnificent Greek temple built by Louis Philippe for the mausoleum of the Orleans family. In the town the hôtel de ville and the parish church, a handsome Gothic structure, are the principal buildings. The chief manufactures are serges and woollen hosiery. There are also iron foundries, tan yards, and dye works, and a trade in cattle, sheep, and grain.—Dreux was called

by the Romans Durocasses, which, contracted into Drocae, was the origin of the modern name. It was one of the early acquisitions of the Northmen in France, and became the capital of the Norman county of Dreux, which was taken by Robert II. in the 11th century, and was afterward held by members of the royal family till 1585, when it was sold to the house of Nemours. It returned to the crown under Louis XV. The town was burned by the English in 1188. In 1562 a bloody battle was fought near it between the Catholics and Protestants, in which the latter were defeated and the prince of Condé, their commander, taken prisoner. In 1593 Henry IV. captured the town after a siege of 12 days. In November, 1870, it was occupied by the German troops.

DREW, a S. E. county of Arkansas, drained by Bartholomew bayou and affluents of the Saline river; pop. in 1870, 9,960, of whom 3,854 were colored. The area was about 900 sq. m., but a portion has recently been taken for Lincoln county. It is nearly level, and has a fertile soil. A great part of the land is covered by forests of cypress, ash, &c. The chief productions in 1870 were 8,828 bushels of wheat, 222,140 of Indian corn, 9,850 of oats, 32,775 of sweet potatoes, and 6,661 bales of cotton. There were 1,284 horses, 3,079 milch cows, 6,111 other cattle, and 12,613 swine. Capital, Monticello.

DREW, Samuel, an English clergyman, born at St. Austell, Cornwall, March 3, 1765, died March 29, 1833. He was apprenticed to the shoemaker's trade, and his early education was limited. In 1788 he became a local preacher of the Wesleyan church. He pursued an extensive course of reading, and early attempted authorship. His gains from literary work induced him to leave the shoemaker's trade in 1809. In 1819 he became editor of the "Imperial Magazine," published at Liverpool, which under his management was eminently successful; and he continued to edit it after its removal to London until the year of his death. In 1824 Marischal college, Aberdeen, bestowed on him the honorary degree of A. M., and soon after he was offered a professorship in the London university. His chief works are: "Remarks upon the First Part of the Age of Reason, by Thomas Paine" (3d ed., 1799); "Essay on the Immateriality and Immortality of the Soul" (1802); "Essay on the Identity and general Resurrection of the Body" (1809); "Life of Dr. Coke" (1816); and "Treatise on the Existence and Attributes of God" (2 vols., 1820).

DREYSCHOCK, Alexander, a German composer, born at Zack, Bohemia, Oct. 15, 1818, died in Venice in April, 1869. He studied four years under the direction of Tomascheck, and in 1838 undertook his first tour as a pianist through northern Germany. The years 1840 to 1842 were passed in Russia, after which he was repeatedly heard in all the principal European cities. In 1862 he was appointed pro-

fessor in the conservatory of St. Petersburg, and in 1865 pianist to the emperor. He was also chapelmaster to the grand duke of Hesse-Darmstadt. As a player he was distinguished for his grace and expression, for great facility in left-hand passages, and the astonishing rapidity of his octave playing. He published more than 140 works, which are marked for their clearness, symmetry, and fine singing style. They consist of military rondos for piano and orchestra, sonatas, studies, fantasias, nocturnes, songs without words, and the like.

DREYSE, Johann Nikolaus von, a German mechanic, inventor of the needle gun, born at Sömmerda, Prussia, Nov. 20, 1787, died Dec. 9, 1867. He was the son of a locksmith, and worked at his trade in Germany till 1809, when he went to Paris, and was employed there in a rifle factory till 1814. After his return to Sömmerda he made models for machinery, and established an ironware factory. In 1824 he received a patent for the manufacture of percussion caps, and in 1825 one for a steam engine worked by a generator instead of a boiler. In 1827 he completed his invention of the muzzle-loading, and in 1836 that of the breech-loading needle gun, under the patronage of the Prussian government. The breech-loader was first employed in the Prussian service in 1840. In 1841 he established a large factory, which between that time and 1863 produced 300,000 needle guns, and employed in 1863 about 1,500 persons. He was ennobled in 1864.

DROGHEDA, a town and port of Ireland, in the province of Leinster, and counties Meath and Louth, on the river Boyne, 4 m. from its mouth, and 26 m. N. of Dublin, with which it is connected by rail; pop. in 1871, 16,135. It was for a long time strongly fortified, and from an early period till about the close of the 17th century was regarded by the English as a post of great importance. It was for three centuries the principal rendezvous of the numerous troops marched against the refractory and rebellious chieftains of Ulster and Leinster. It was gallantly defended in the civil war against a large force under Sir Phelim O'Neill (1641-2). In 1649 it was stormed by Cromwell, and on account of the carnage then inflicted the name of the protector is still abhorred by the inhabitants. In 1690 the town held out against the troops of William III. until after the battle of the Boyne, fought two miles from its walls, which is commemorated by an obelisk 150 feet high raised upon the spot where Schomberg fell. Few of the ancient fortifications remain. The only perfect specimen is the St. Lawrence gate, consisting of two lofty round towers with the low gateway between. The Magdalen's steeple, a square structure of elegant proportions, is all that remains of a Dominican convent founded in 1224. Among

many other ruins are those of a Carmelite convent, and of a hospital of the knights of St. John of Jerusalem. The town is now the seat of extensive cotton and linen manufacto-

Gate of St. Lawrence.

ries, tanneries, and breweries, and has some ship building and considerable trade in corn and cattle. Its harbor has been much improved within a few years, and vessels of 250 tons can discharge at the quay. Steamers ply constantly between Drogheda and Liverpool.

DROHOBYCZ, a town of Austria, in Galicia, situated on a small tributary of the Dniester, 18 m. S. E. of Sambor; pop. in 1870, 16,884. Its Catholic church is the handsomest religious edifice in Galicia. It has important salt works and manufactories of pottery, leather, and linens.

DROITWICH, a parliamentary and municipal borough of Worcestershire, England, 6 m. N. E. of Worcester and 132 m. by rail N. W. of London; pop. of the parliamentary borough in 1871, 9,510; of the municipal, 3,504. It is lighted with gas, and has a lunatic asylum and a hospital. Its chief trade is in salt, for the production of which it is famous, and which has been made there for more than 1,000 years. It is obtained from brine springs which rise near the centre of the town from a depth of 200 ft. The brine contains about 33 per cent. of salt, and used as baths has proved highly beneficial in cases of rheumatism and gout. About 100,000 tons of salt are made annually, which is shipped mostly by a canal connecting with the river Severn, capable of admitting vessels of 60 tons. The brine springs were anciently called *weylches* (Saxon), hence the name of the town, the prefix *droit* being supposed to refer to some right or privilege of the early inhabitants to manufacture salt. The town is supposed to have been the Roman Salinæ.

DRÔME, a S. E. department of France, formed from parts of Dauphiny and Provence, bordering on the departments of Isère, Hautes-Alpes, Basses-Alpes, Vaucluse, and Ardèche, from the

last of which it is separated by the Rhône; area, about 2,500 sq. m.; pop. in 1872, 320,417. It derives its name from the river Drôme, which crosses it from E. to W., dividing it into two nearly equal parts. It is drained also by the Isère and numerous other streams, all, like the Drôme, affluents of the Rhône. The surface is much broken by mountains, particularly in the east, where the spurs of the Alps rise to an average height of 4,000 to 5,000 ft. These furnish excellent pasturage, and are browsed in the summer and autumn by large flocks of sheep, many of which are driven thither from neighboring departments. Fir, oak, and beech trees grow on the summits, and on the lower hills are plantations of chestnuts and walnuts, from the latter of which oil is made. The forests abound in game and the lakes and streams in fish. A large part of the soil is thin and sandy, and not enough grain is raised for home consumption; but the vine, olive, mulberry, and other fruits are raised in large quantities. Some of the vineyards are famous, among them

L'Hermitage near Tain, on the Rhône, and those of Châteaufort, Douzère, and Montélimart. The making of wine and the production of silk are the chief industries. There are manufactures also of porcelain, beet-root sugar, coarse woollens, hosiery, serge, linens, gloves, leather and morocco, paper, and bricks. Mines of iron, lead, and coal are worked, and gypsum and marble abound. The department is divided into the arrondissements of Valence, Die, Montélimart, and Nyons. Capital, Valence.

DROMEDARY. See CAMEL.

DRONTHEIM (Danish, *Thronthjem*; locally, *Drontjem*). **I.** A province (diocese) of Norway, bordering on Sweden and the Atlantic; area, 19,550 sq. m.; pop. in 1865, 256,529. It is mountainous, and much of it well wooded. The coasts are indented by numerous bays, the most important of which is the Drontheim fiord, running 60 m. inland in an E. and N. E. direction, but describing with its windings a curve of 90 m.; and the surface is dotted over with lakes. The inhabitants are engaged chiefly in fishing, cattle raising, iron mining, and to some extent in agriculture. Fruit, hops, flax, and hemp are the principal crops; but little grain is raised. **II.** A town, the capital of the province, and the third of the cities of Norway in importance and population, in lat. 63° 25' N., and lon. 10° 23' E., on a small gulf near the outlet of the river Nid, by which river and the sea it is almost

entirely surrounded, 233 m. N. of Christiania; pop. in 1870, 20,858. The most interesting edifice is the cathedral of St. Olaf, founded in the 11th century; the little of the original building that remains and forms part of the present cathedral is sufficient to show that it was a magnificent Gothic structure. The harbor is not deep, and is frequented only by small vessels. Its trade consists chiefly in exports of masts, copper and iron, goat skins, and dried and salted fish. It has a public

Cathedral of Drontheim.

library, a museum, and a society of arts and sciences, founded in 1760. On a rock in the midst of the harbor is the fortress of Munkholm, anciently an abbey, then a state prison, and now the chief fortification of the city on the sea side. On the land side Drontheim is commanded by a succession of picturesque heights. It was founded in 997, and for a long time was the residence of the kings of Norway, who were consecrated and crowned in its cathedral; and the kings of Sweden are still crowned there as kings of Norway. As it was formerly built only of wood, it has been several times almost entirely destroyed by fire.

DROPSY (originally *hydropsy*; Gr. *ὑδωρ*, water, and *ὄψις*, the face or appearance), a morbid collection of fluid in one or more of the serous cavities within the body, or in the areolar tissue beneath the skin, and in other situations. A dropsical accumulation is to be distinguished from the effusion of liquid which takes place in certain inflammatory diseases, pleurisy, peritonitis, pericarditis, &c. In these diseases the effusion is due to inflammation, whereas in dropsy transudation takes place without the parts where it occurs being inflamed. Moreover, the liquid which is the result of inflammation is either purulent or accompanied by coagulable lymph or fibrinous exudation. Dropsy may be local or general. It is local when the effusion of liquid is con-

fined to a single serous cavity, or to the areolar tissue within a limited space. In medical nomenclature dropsical affections in the different serous cavities are expressed by the prefix hydro in connection with the names of the serous structures. Thus, hydrothorax is the name for a dropsical effusion into the pleural cavity; and so hydropericardium, hydrocephalus, hydroperitoneum, &c., denote dropsy in the several situations which these names express. An effusion into the areolar tissue is called œdema; thus, œdema of the face, of the limbs, and of different internal organs. An exception to the usual significance of the name œdema is afforded by the affection known as œdema of the lungs; the dropsical effusion in this affection taking place, not into the areolar tissue, but into the air cells. Dropsy is said to be general when effusion into the areolar tissue beneath the skin exists more or less over the whole body, accompanied with effusion into certain serous cavities, especially the pleural and the peritoneal. The name anasarca is used to denote general dropsy. In all cases dropsy is a symptom of disease seated elsewhere than in the situations where the dropsical effusion takes place. Thus, the local dropsy of most frequent occurrence is hydroperitoneum, called also ascites and hydrops abdominalis. Here, the effusion into the peritoneal cavity is generally symptomatic of disease of the liver, and especially of that form of disease, caused by spirit drinking, called cirrhosis of the liver, other names being gin liver, whiskey liver, and hobbled liver. The explanation of the dropsy in these cases is as follows: The veins from the organs within the abdomen unite to form the vein called the *vena portæ*, which passes into the liver. All the venous blood contained in the other abdominal viscera circulates in the liver, and passes thence to the heart to enter the general circulation. In cirrhosis of the liver, the circulation within this organ is obstructed, and venous congestion of the other abdominal organs results. Serous transudation into the peritoneal cavity is the effect of this congestion (portal congestion, as it is called). Sometimes a tumor within the abdomen is so situated as to press upon the *vena portæ* and occasion an obstruction to the passage of blood through this vessel, and in this way hydroperitoneum may be produced. In other local dropsies the rationale, in general, is similar; that is, the dropsical effusion is the result mainly of the hydraulic pressure due to a persistent over-accumulation of blood in the veins which are in relation to the part where the dropsy takes place. The same principle is chiefly concerned in the causation of general dropsy in a certain proportion of cases. The dropsy in these cases is due to an obstruction affecting the venous system throughout the body. In the great majority of these cases the obstruction is incident to diseases of the heart, and it is customary therefore to distinguish them as cases of cardiac dropsy. Cer-

tain organic affections of the heart, before they end fatally, give rise to more or less general dropsy or anasarca. In other cases general dropsy depends in a great measure on a morbid attenuation of the blood, which becomes watery, and hence the serous portion tends to transude through the pores of the vessels. This is the explanation, at least in great part, of the occurrence of general dropsy in cases of certain affections of the kidneys included under the name Bright's disease. The blood becomes watery, or hydræmic, in consequence of the constant elimination of albumen by the kidneys. The dropsy in these cases is distinguished as renal dropsy. In by far the larger number of cases of general dropsy it is either cardiac or renal. Not infrequently, however, there is a coexistence of disease of the heart and disease of the kidneys, and then venous obstruction and watery blood may concur in producing the general dropsy. When not dependent on disease of the heart or the kidneys, general dropsy is a symptom of hydræmia, together with feebleness of the circulation. It occurs sometimes as a sequel of prolonged intermittent fever.—The treatment of dropsy, either local or general, involves measures indicated by the diseases which stand in a causative relation to the dropsy; for example, the disease of the liver in cases of hydroperitoneum, and of the heart or of the kidneys in cases of cardiac or renal dropsy. Exclusive of these indications, it is often an object of treatment to effect either removal or diminution of the dropsical accumulation. Remedies which produce watery evacuations from the bowels, and those which increase the secretion of urine, are chiefly relied upon for the accomplishment of the object just stated. This is also sometimes promoted by producing free perspiration. The employment of the cathartics called hydragogues, and of diuretics, is to be governed by an appreciation of the diseases coexisting with the dropsy, by the condition of the patient, and by the varied circumstances pertaining to individual cases. The liquid in serous cavities may be removed by a puncture or an incision, an operation called paracentesis, or vulgarly tapping. In some cases of dropsy of the chest paracentesis is resorted to (called also thoracentesis), but this operation is much oftener employed in pleurisy with effusion than in cases of dropsy. Tapping of the abdomen (*paracentesis abdominalis*) is often employed, and is in many cases useful, not only by relieving suffering but promoting recovery. In cases of general œdema, or anasarca, if the effusion be very large, great relief is sometimes obtained by minute punctures of the lower limbs, through which the serum drains away in abundance.

DROSTE, Annette Elisabeth, Baroness Hüls-hoff, a German lyrical poetess, born near Münster, Jan. 12, 1798, died in a villa near the lake of Constance, May 24, 1848. Her health was bad, and her whole life was devoted to religion, study, and poetry. She left many compositions,

of which *Das geistliche Jahr, nebst einem Anhang religiöser Gedichte*, appeared in 1852.

DROUET, Jean Baptiste, a French revolutionist, born at Sainte-Menehould, in Champagne, Jan. 8, 1763, died in Mâcon, April 11, 1824. After serving seven years as a common soldier, he returned to his native town, where he assisted his father, who was at the head of the post office. In the evening of June 21, 1791, the royal family, on their flight to the frontier, stopped at the town to change horses, when Jean Baptiste identified Louis XVI. and Marie Antoinette, and caused them to be arrested. For this the national assembly voted him 30,000 francs, which he is believed to have refused; and in September, 1792, he was chosen member of the convention by his native department of Marne. Here he became one of the most violent of the terrorists. He voted for the immediate death of the king, and on July 20, 1793, he proposed a wholesale butchery of the English residents of France. In September he was sent on a mission to the army of the north, fell into the hands of the enemy, and was sent to the fortress of Spielberg. This added to his popularity, and on his return to Paris in December, 1795, he was received with great enthusiasm, and appointed secretary of the council of 500. He joined Babeuf's conspiracy and was imprisoned, but made his escape, and took refuge in Switzerland, and afterward in the Canary islands. Here he aided the inhabitants in repelling the attack of Nelson on Tenerife in 1797. Being acquitted in the Babeuf trial, he returned to Paris and resumed his old position. After the advent of Napoleon he suddenly and completely dropped his republican convictions, became a sub-prefect, and fought in 1814 against the allies. During the hundred days he represented his department in the chamber of deputies, but under the restoration he was expelled from France as one of the regicides. He passed the last years of his life at Mâcon under the fictitious name of Merger, and was only identified after his death.

DROUET D'ERLON, Jean Baptiste, count, a French general, born in Rheims, July 29, 1765, died in Paris, Jan. 25, 1844. He entered the army as a private in 1782, was discharged in 1787, reentered it as a volunteer in 1792, became aide-de-camp to Gen. Lefèvre, was present at the sieges of Valenciennes, Quesnoy, and Condé, and in 1797 at the investment of Ehrenbreitstein. He was made a general of brigade in 1799, and fought in that year in Switzerland, at Schaffhausen, Zürich, and Constance. He also served at Ulm, Hohenlinden, and Steyer, and was made general of division in August, 1800. The success of the French arms at Jena was largely due to the skilful manœuvres by which he defeated the Prussian column under Von Trescott. He further distinguished himself at the siege of Dantzic and the battles of Mohrungen and Friedland, and in 1807 received the title of count d'Erlon and a gift of 25,000 francs. He

subsequently fought with distinction in the Tyrol and in the Peninsular war. After the first restoration he was given the command of the 16th division of the army, and received other honors; but in March, 1815, he was arrested for complicity in a conspiracy against Louis XVIII., and thrown into prison. The return of Napoleon from Elba soon gave him his liberty, and he resumed his command. Napoleon made him a peer of France in June, 1815, and treated him with great favor until the battle of Waterloo. Here his apparent inaction, which he afterward sought to prove was the effect of contradictory orders, caused the emperor to reproach him bitterly. He resided at Munich ten years, and established a brewery there. When Charles X. in 1825 granted amnesty to those who had fought for the reestablishment of the empire, he returned to France. After the revolution of July, 1830, he became commander of the 12th military division, and in 1834 he was appointed governor general of the French possessions in Africa. In 1843 he was made a marshal of France.

DROUYN DE LHUYS, Édouard, a French diplomatist, born in Paris, Nov. 19, 1805. He studied law, was successively attached to the embassies at Madrid and the Hague, and in 1840 became head of the commercial bureau in the ministry of foreign affairs. In 1842 he took his seat as an opposition member of the chamber of deputies, was dismissed from office, and became one of the most active opponents of Guizot and a prominent orator at the reform banquets. After the revolution of 1848 he was elected to the constituent assembly, and became president of the committee on foreign affairs. He was a leading supporter of Louis Napoleon, who called him into his first ministry. In June, 1849, he was appointed ambassador to England. He adhered to Louis Napoleon after the *coup d'état* of Dec. 2, and under the empire was minister of foreign affairs. In the negotiations preceding the Crimean war, at the conference of Vienna, he endeavored to prevent it, and resigned on account of his failure. In 1856 the emperor sent a message to the senate reflecting upon its inactivity, whereupon Drouyn de Lhuys resigned his seat in the senate, and accepted the presidency of the council of administration of the eastern railways. He again became minister of foreign affairs in 1862, and as such urged the cabinets of Prussia and England to propose a six months' truce between the contending parties in the United States, but without result. On Sept. 15, 1864, he signed the convention with Italy concerning the recall of the French troops from Rome. In 1866 he desired France to intervene between Prussia and Austria, but his views not prevailing, he resigned Sept. 1. On the downfall of the empire he went to the island of Jersey.

DROWNING. The specific gravity of the human body is very little greater than that of water; for though the muscles and the bones are heavier (the one being 1.085, the other

2.01, the fat (0.92) is specifically lighter, and the air within the thorax tends to establish an equilibrium. Owing to this, a very slight exertion enables one to keep himself at the surface of the water; but any part of the person, as an arm, raised out of the fluid, acts like a weight imposed upon the rest of the body, and thus inexperienced persons are often drowned by their own struggles. Death takes place from asphyxia; the blood in the lungs being unchanged by the action of air, the circulation through these organs is obstructed, and the blood becomes charged with carbonic acid; insensibility is rapidly induced, and death takes place, frequently preceded by convulsive movements. The period during which the submersion may continue without death varies in different persons. (See DIVING.) In some instances bodies submerged but a minute, in despite of all attempts at restoration, have been found completely lifeless, while many cases are on record in which recovery has taken place after a submersion of five minutes. In the "London Medical Gazette," vol. xxxi., a case is given of recovery after 14 minutes' submersion; the time here was calculated, but the circumstances render the calculation exceedingly probable. The explanation of recovery after prolonged submersion has been sought in the occurrence of fainting at the moment of the fall, and it is certain that during syncope the demand for air is very much diminished.—When the body is recovered a few hours after drowning, the skin is cold and pale, presenting sometimes patches of livid discoloration; the expression is placid, the eyes half open, the pupils dilated, the tongue swollen and pressed forward, and the lips and nostrils covered by a mucous froth; the fingers are sometimes found torn and abraded, and the hand grasping gravel or other substances which have been seized in a convulsive struggle at the bottom. Internally the body presents few appearances which are characteristic of the mode of death; of these the presence of a mucous froth, sometimes stained with blood, and perhaps of a little water in the trachea, and of water in the stomach, are most noteworthy. The water contained in the stomach appears to be swallowed previous to death; after death the apposition of the sides of the œsophagus prevents the entrance of water into the stomach. When the body is recovered after a short immersion in the water, efforts for resuscitation should be made immediately, and perseveringly continued until recovery takes place or the case is evidently hopeless. In a case related by Mr. Bloomfield $1\frac{1}{2}$ hour elapsed before there was any appearance of returning animation; and in one by Dr. Douglas ("Medical Gazette," vol. xxxi., p. 449), success was met with only after 8½ hours. The plan proposed by Dr. Marshall Hall in 1855 is based on physiological principles, and has been found eminently successful in practice. His rules are as follows:

1. Treat the patient instantly, on the spot, in the open air, freely exposing the face, neck, and chest to the breeze, except in very severe weather. 2. Send with all speed for medical aid and for articles of clothing, blankets, &c. 1. *To clear the throat.* 3. Place the patient gently on the face, with one wrist under the forehead. All fluids, and the tongue itself, then fall forward, and leave the entrance into the windpipe free. 11. *To excite respiration.* 4. Turn the patient slightly on his side; apply snuff or other irritant to the nostrils; and dash cold water on the face, previously rubbed briskly until it is warm. If there be no success, lose no time, but apply the third rule. 111. *To imitate respiration.* 5. Replace the patient on his face. 6. Turn the body gently but completely on the side, and a little beyond, and then on the face, alternately, repeating these measures deliberately, efficiently, and perseveringly, 15 times in the minute only. (This number of thoracic movements per minute agrees with the natural order of respiratory thoracic dilatations and contractions, corresponding with a slow movement of the heart, averaging something less than 60 pulsations per minute, and therefore merits due attention.) The rationale of the operation is this: When the patient reposes on the thorax, this cavity is compressed by the weight of the body, and expiration is promoted; when he is turned on the side, this pressure is removed, and inspiration is facilitated. 7. When the prone position is resumed, make equable but efficient pressure along the spine, removing it immediately before rotation on the side. (The first measure augments expiration, the second commences inspiration.) IV. *To induce circulation and warmth.* 8. Continuing these measures, rub the limbs upward, with a firm pressure and with energy, using handkerchiefs, &c. 9. Replace the patient's wet clothing by such other covering as can be instantly procured, each bystander supplying a coat or waistcoat. Meanwhile, and from time to time, proceed to the fifth rule. V. *To excite inspiration.* 10. Let the surface of the body be slapped briskly with the hand; or, 11. Let cold water be dashed briskly on the surface, previously rubbed dry and warm.

DROYSEN, Johann Gustav, a German historian, born at Treptow, Pomerania, July 6, 1808. He studied at Stettin and at Berlin, and between 1829 and 1840 was a teacher at a gymnasium in the latter city, and private tutor and professor at the university. In 1840 he went to Kiel as professor of history, and during a residence of ten years was an active partisan of the duchies of Schleswig and Holstein in the controversy with Denmark. He was the author of the "Kiel address" of 1844, and in 1846 took part in the preparation of the protest signed by nine professors of the university. On the establishment of the provisional government in Kiel in 1848, he was sent as a plenipotentiary to the diet at Frankfort, where he advocated the rights of the duchies. Subsequently he was a member of the Frankfort parliament. In 1851 he was called to Jena as professor of history, and in 1859 to the same chair at Berlin. Among his earlier works are translations of *Æschylus* and *Aristophanes*, a history of Alexander the Great (1833), and a history of Hellenism (2 vols., Hamburg, 1836-'43). Turning his attention to modern history, he published *Vorlesungen über die Geschichte der Freiheitskriege* (Kiel, 1846); *Leben des Feldmarschalls Grafen York von Wartenburg* (Berlin, 1851); and *Geschichte der preussischen Politik* (10 vols., Berlin, 1855-'70).

DROZ, François Xavier Joseph, a French author, born in Besançon, Oct. 31, 1773; died Nov. 4, 1850. In 1803 he removed to Paris, where he became acquainted with the prominent philosophers of the day. After a variety of smaller works which failed to attract attention, he published in 1806 an *Essai sur l'art d'être heureux*, which passed through numer-

ous editions, and was translated into English. In 1812 he published *Éloge de Montaigne*, in 1815 *Essai sur le beau dans les arts*, and in 1823 *De la philosophie morale, ou des différents systèmes sur la science de la vie*, which received the Monthyon prize, and paved the way to his admission to the French academy, Lammartine being his competitor. In 1825 he wrote a book on the application of morals to philosophy and politics. He is also the author of an essay on political economy, and of a work on Christianity, which derives interest from the personal religious experiences added to the book, under the title of *Œuvres d'un philosophe chrétien*, in which the author abandons his early theology and returns to the doctrines of the church of Rome. His most important work is his *Histoire du règne de Louis XVI.* (3 vols., Paris, 1839-42), with an introduction on the history of France from Louis XIV.

DROZ, Gustave, a French author, born in Paris, June 9, 1832. He studied at the colleges of Stanislas and Henry IV., and received subsequently instruction in drawing and painting at the school of École des arts. In 1864 he joined Marcellin in editing the journal *La vie parisienne*, and published in it a series of works, under the pseudonym of Gustave Z., which passed through 20 editions within two years, as separate volumes entitled *Monsieur, Madame et Bébé; Entre nous; and Le cahier bleu de Mlle. Cibot*. His style presents a strange mixture of malice, skepticism, and mirth, though he describes the miseries and sorrows of life with great delicacy and deep feeling. He has since published *Autour d'une source* (1869) and *Un paquet de lettres* (1871). His works have been translated into English.

DROZ. I. Pierre Jacquet, a Swiss mechanician, born at La Chaux-de-Fond, July 28, 1721, died at Bienné, in the canton of Bern, Nov. 28, 1790. In the divinity school of Basel he prepared for the church, but on his return home his attention became directed to the manufacture of watches and clocks, for which his native town is celebrated. He eventually perfected the different parts of clockwork, and supplied common timepieces with a musical machinery which imitated a chime of bells and the sounds of the flute. He made many experiments for the purpose of effecting perpetual motion. His most ingenious contrivance was a pendulum composed of two metals of unequal dilatibility to counteract the effects of heat and cold. This was purchased by the king of Spain, who bestowed a pension upon the inventor. His most celebrated production was a writing automaton, which moved its fingers and hands, and formed letters. At the time of his death he was engaged upon the fabrication of a new astronomical clock. **II. Henri Louis Jacquet**, son of the preceding, born Oct. 13, 1752, died in Naples, Nov. 18, 1791. In 1774 he removed to Paris, and became celebrated for his mechanical productions, especially an automaton representing a young

lady playing on the harpischord, following the music with her eyes and the movements of her hands, and, when done playing, rising and bowing to the audience. The most famous specimen of his inventive genius in this respect was a pair of artificial hands which he devised for La Raynière, who had lost his hands during a hunting expedition.

DRUIDS, an order of priests which in ancient times existed among certain branches of the Celtic race. The name has been variously deduced from the Saxon *dry*, a magician; from the Greek *δρυς*, and the Celtic *deru*, an oak; from the Irish *drui* or *draui*, a sacred person, &c.; but the most probable derivation seems to be that given by the abbé Pierre de Chiniac, who refers it to the old Celtic compound *derouyd*, from *De*, God, and *rouyd*, speaking, a participle of the verb *rouyddim*, to speak. The origin of the institution is no clearer than

A Druid Priest.

the etymology of the name. The druids did not allow their tenets and history to be committed to writing, and the ancient Greek and Roman authors describe them only in the vaguest language. It seems to be generally conceded that they were of eastern origin, because of the many and striking analogies between what we are told of their belief and practices, and what we know to be characteristic of the oriental nations. At the time when this mysterious order became known more clearly to history, *i. e.*, in the first century before and after Christ, they inhabited chiefly Gaul and the islands of Britain. In Gaul their principal seats were in the west and centre, in modern Brittany and along the Loire, while beyond the channel they were found in Wales and Ireland, and afterward in the island of Mona or Anglesea. According to

some writers Brittany was their cradle; but the Welsh traditions relate that they entered Gaul from the remote east at the same time with that branch of the Celtic race which is denominated the Kymric or Cymraeg. At least it is evident that they did not prevail among the Belgic branches of the people of Gaul at the north, nor yet among the Aquitanian or Basque branches at the south. Their capital in Gaul was in the territory of a tribe called the Carnutes, corresponding nearly to the province of Orléanais. Julius Cæsar is the ancient writer who has given the clearest account of the druids, and Godfrey Higgins, in his "Celtic Druids," the modern who has most elaborately investigated their faith; but the Welsh triads are regarded by many as the most authentic sources of information in regard to them. Their characteristics, in the view of Mr. Higgins, consisted in the adoration of one Supreme Being, in the belief of the immortality of the soul and a future state of rewards and punishments, taking the form of a species of metempsychosis, in the use of circular temples open at the top, in the worship of fire as the emblem of the sun, in the celebration of the great Tauric festival (when the sun entered Taurus), and in the knowledge of an alphabet of 17 letters, though their instructions were always oral. If they acknowledged but one supreme God, they admitted other inferior deities, such as Hesus, Tarann, Belen, &c., to whom they paid a qualified worship. In their sacrifices to these the bodies of human victims often smoked on the same altars with the carcasses of beasts. Their objects were apparently moral, for they professed "to reform morals, to secure peace, and to encourage goodness;" yet with these high aims they connected pernicious superstitions and pretences to a magical knowledge. They assumed, says Cæsar, to discourse of the hidden nature of things, of the extent of the universe and of the earth, of the forms and movements of the stars, and of the power and rule of the gods. On all these subjects their instructions were conveyed orally, and by means of verses, which required a novitiate of 20 years before they could be well committed to memory. The triads of the Welsh bards are supposed to be specimens of this species of verse. They undoubtedly possessed some knowledge of the movements of the heavenly bodies, beyond what simply pertained to the regulation of their religious festivals, inasmuch as they composed the year by lunations, which supposes an acquaintance also with the solar year. Various relics found in Ireland among the druidical remains, thought to be astronomical instruments designed to show the phases of the moon, are described by Sir William Betham in the "Transactions of the Royal Irish Academy." At the same time not a little of astrology, divination, and magic was mixed up with their purer science. In their doctrine of medicine particularly there was far more of superstition than of knowl-

edge. To a great many plants they attributed a mystic sacred character; and most of all to the mistletoe, which they esteemed an antidote to all poisons and a cure for all diseases. It was gathered at certain seasons, with the most formal and pompous ceremonies. As soon as it was discovered, twining the no less sacred oak, the druids collected in crowds about the tree, a banquet and a sacrifice were prepared, a priest in white vestments cut the twig with a golden sickle, two other white-robed priests caught it in a white cloak, two milk-white heifers were instantly offered up, and the rest of the day was spent in rejoicing. Under similar mystic faith they plucked the *samolus*, or marshwort, with the left hand, fasting, and without looking at it; and the *helago*, or hedge hyssop, after ablutions, or offerings of bread and wine, barefooted, and without a knife. The vervain likewise demanded distinct ceremonials. All these plants were regarded as powerful prophylactics and remedies, not only in respect to physical diseases, but to the dark workings of evil. They were carried about as charms, as well as amber beads, which the druids manufactured for warriors in battle, and which are still found in their tombs. A more potent talisman was the serpent's egg, which, according to Pliny, oozed out of the mouths of serpents when knotted together, and which they supported in the air by their hissings. That was the moment to seize it; and he who attempted to do so must suddenly dart from his hiding place, catch it in a napkin, and mounting a horse gallop off at full speed, to escape the pursuing serpents, until he had put a river between him and them. Among the druids, as among the Romans, auguries of the future were made from the flight of birds, and from an inspection of the entrails of sacrificed animals. Their profounder ceremonies, performed in the depths of the oak forests or of secluded caves, are known to us only through the vaguest traditions, and in the stupendous but dilapidated stone monuments which strew the surface of France and Britain.—The druids were organized into a regular hierarchy, consisting of a triad, like almost everything else among them, viz.: the bards, the vates or prophets, and the priests proper. The bards were poets not only of a religious but of a martial and satirical class. (See BARD.) The vates were the diviners or revealers of the future, who were charged with the conduct of sacrifices and other external ceremonies, and who, mingling in almost every event and relation of common life, stood as mediators or interpreters between the people and the more mysterious hieropants. These were the druids proper, or the priests, who dwelt in the depths of the oak forests, preserving the mystic doctrines of the faith, and consulting more directly the secret will of the divinity. They were the teachers of the youth, who resorted to them in great numbers; and they also exercised the judicial

function. All men, whether in a public or private capacity, had to submit to their decisions, for the recalcitrant was condemned to excommunication, which rendered him an outcast and an outlaw. Over the community or college of druids an arch-druid presided, whose authority was supreme and irrevocable, although his office was elective. The election was made by the suffrages of the whole body, but sometimes, in the rivalry of factions, led to serious conflicts of arms. At a fixed period every year they assembled at a consecrated spot in the territory of the Carnutes, which passed for the centre of Gaul, whither all resorted who had disputes to settle or decrees to solicit. The entire priesthood were exempted from all taxation or imposts, and from every burden of war or peace.—Affiliated to these three orders, without sharing their prerogatives, were prophetesses, or sorceresses, apparently divided into three orders also, according to their degrees of sanctity. Their rules were whimsical and contradictory, but their influence over the fears of the people was powerful. One branch of them could declare the secrets of futurity only to those who had polluted them; another was devoted to perpetual virginity; a third to long periods of celibacy, or they were allowed to visit their husbands but once a year; while others had to assist at nocturnal rites with their naked bodies painted black, their hair dishevelled, and abandoning themselves to transports of fury. Their favorite resort was the island of Sena, where the nine Senes dwelt, and the nameless islet opposite the mouth of the Loire, where once every year, between sunrise and sunset, they pulled down and rebuilt the roof of their temple; but if any one by chance let fall a particle of the sacred materials, she was torn to pieces, amid frantic dances, in which the Greeks saw the rites of their own Bacchantes, or the orgies of Samothrace.—The druids attained to an almost absolute rule, which was in many respects beneficial, but it also inevitably degenerated into tyranny. They sooner or later, therefore, aroused the jealousy of another order in society, which Cæsar designates the *equites* or warriors, who had taken the lead in the political conduct and constitution of the tribes. It is supposed that these gradually overthrew the power of the druids in Gaul. When that country was subdued by the Romans, the druidical religion gradually retired before the classic heathenism, and withdrew, at first into Armorica, and then into Britain, where in the time of Nero it was assaulted and mostly suppressed. It lingered as a public worship longest in the island of Anglesea, whence it was finally driven out by the Romans with great fierceness. As a private superstition it continued to hold sway for many years thereafter over the minds of the Celtic tribes and their descendants. The only modern remains of druidism are the immense structures of stone, the menhirs, cromlechs, dolmens, and

avenues, which are found in the immense ruins at Stonehenge, Avebury, and Carnac, as well as in many smaller forms throughout Great Britain and western France.—See Barth, *Ueber die Druiden der Celten* (1826); G. Higgins, "Celtic Druids" (1827); and the first volume of Henri Martin's *Histoire de France* (1833).

DRUM (Dan. *trom*; Ger. *Trommel*), in music, a hollow cylinder of thin wood or brass, covered at each end with vellum or parchment, the tension of which is regulated by small cords or braces on the outer side of the instrument acted upon by sliding knots of leather. The common drum is suspended at the side of the drummer, whence it is called the side drum, and is beaten upon at one end with sticks. An instrument similar in shape, but on a much larger scale, called the base drum, is beaten at both ends with drumsticks having leather pads on the knobs. Both kinds are highly effective in military bands. Another species, called the kettle drum, consists of a thin copper basin, nearly hemispherical, the parchment covering of which is held by an iron rim, and tightened or relaxed by screws. Kettle drums are always in pairs, one instrument being tuned to the key note, and the other to the fifth of the key. They are generally supported on iron tripods. Instruments of percussion of the drum species have been familiar in the East from remote ages, and among savage races in all parts of the world are used in the celebration of religious rites as well as for the performance of music. They were common among the Egyptians, chiefly for military music, as early as 1600 B. C., some being long cylinders, similar to the tomtoms of India, which were beaten with the hand, while others were of a barrel shape and were beaten with sticks. Among the Greeks and Romans the drum, called the *tympanum*, had the form of the modern kettle drum or of the tamborine. The drum was probably introduced into Europe by the Saracens and Moors, by whom it was called the *tumbur*, whence the Spanish *tambor* and the French *tambour*; and in the first half of the 14th century it was generally adopted for military music.

DRUMMOND, Thomas, a British naval officer and inventor, born in Edinburgh in October, 1797, died in Dublin, April 15, 1840. While a cadet at Woolwich he displayed unusual mathematical ability, and attracted considerable attention by rejecting as unsatisfactory a standard demonstration in conic sections, and supplying a new and original one, which was adopted in future text books. In 1820 he was employed in the trigonometrical survey of the United Kingdom. He had given considerable attention to chemistry, and conceived the idea that the incandescence of lime might be put to use for illuminating distant stations in the survey, as a substitute for the argand lamp. In 1824 he was transferred to the survey of Ireland, in which some improved method of illumination was still more a necessity, and there constructed his lamp. Its first trial was

at Slieve Snaught, Donegal, and it was distinctly seen by the engineers at Devis mountain, 66 miles distant. Subsequently it was said to have been visible at a distance of 112 miles. Drummond described his invention in the "Philosophical Transactions" for 1826. When quicklime is subjected to intense heat, such as is produced by the oxyhydrogen blow-pipe, the light emitted is exceedingly powerful and dazzling; the lime itself is slowly volatilized, and the surface around is covered with its sublimate. Drummond placed the light thus produced in the focus of a parabolic mirror, which reflects the rays in parallel lines, thus directing the entire light toward a single point. Many experiments have been made to adapt the Drummond light to lighthouses; but the deficiency of divergence in the rays, and the difficulty of maintaining a regular supply of gases for the blow-pipe, have thus far proved insurmountable. It has been applied to the gas microscope, in which it gives the prismatic colors almost as bright as in the solar spectrum. In 1825 Drummond invented a heliostat, which is still employed in the government survey of Great Britain. He made a large collection of scientific instruments, and carried on extensive experiments for their improvement; but the entire collection and the observatory that contained it were destroyed by a storm in a single night. In 1835 he was appointed under secretary for Ireland. In 1836 he was placed at the head of a commission to plan a railway system for Ireland, and his scheme has been substantially followed. The oft quoted words, "Property has its duties as well as its rights," are from a letter which he wrote to the magistrates of Tipperary in 1838. He was a favorite with the Irish people, who erected a statue to his memory in the royal exchange of Dublin. A memoir of his professional life, by Capt. Larcon, was published in 1841, in the 4th volume of "Papers on Subjects connected with the Duties of the Corps of Royal Engineers."

DRUMMOND, William, a Scottish poet, born at Hawthornden, Edinburghshire, Dec. 13, 1585, died Dec. 4, 1649. He spent about eight years on the continent of Europe engaged in study, travel, and the collection of books; but passed most of the remainder of his life on his estate at Hawthornden, devoting himself to literature. He wrote a history of Scotland from 1423 to 1542; but the work is of little value, and he is chiefly remembered for his poetry and for his "Notes of Ben Jonson's Conversations with William Drummond of Hawthornden, January, 1619." His versification sometimes bears a striking resemblance to that of some of Milton's poems. His sonnets, which form a considerable part of his works, are especially elegant. An edition of his poems, with a life by Peter Cunningham, was published at Edinburgh in 1852.

DRUMMOND, Sir William, a British author and diplomatist, born in Scotland about 1760, died in Rome, March 29, 1828. In 1794 he

published "A Review of the Government of Sparta and Athens," and in the following year was elected to parliament. He sat also in the parliaments of 1796 and 1801, and was sent on diplomatic missions to Naples and Constantinople. He published a number of works, among which are: "Academical Questions" (4to, 1805), containing an attack on all kinds of dogmatism, embracing an exhibition of insoluble problems, and tending to show the weakness of the human intellect; and "Origines, or Remarks on the Origin of several Empires, States, and Cities" (4 vols. 8vo, London, 1824-'9). A work written by him, printed for private distribution, and entitled "The *Œdipus Judaicus*" (1811), brought upon its author much censure and criticism, because of its attempt to explain away some of the narratives of the Old Testament as astronomical allegories. He was an accomplished scholar, and made an excellent translation of the satires of Persius.

DRUSES, or Druzes, a race and religious sect of Syria, chiefly in the southern ranges of Lebanon and Anti-Libanus. Their name is derived from Derazi or Durzi, who, according to the Arabic historian Makrizi, appeared in Cairo A. D. 1019, as a missionary of the Batenian sect, an offshoot from the Moslem stock. The Druses regard him as a heretical pupil of Hamza, the Messiah of their system, and look upon the title which has been fastened upon them as a stigma, the only name they acknowledge being that of Muahids or Unitarians. The proper era of the Druses begins in 1020, when Hamza, a wandering fanatic, persuaded Hakem, the Fatimite caliph of Egypt, to declare himself a manifestation of God. The caliph was assassinated the next year, and Hamza, retiring into Syria, continued to propagate the new faith among the mountain tribes. He and one of his followers, Muktana Boha ed-Din, committed their doctrines to writing, and enjoined the strictest secrecy as to their nature. No member of another sect and no uninitiated Druse was to be permitted to see the sacred writings, and no revelation is to be made until the second advent of the lord Hakem and Hamza his minister. The imperial library of Paris contains five volumes of the sacred writings, the Vatican contains one, the imperial library at Vienna one, the library of the Leyden university two, and the Bodleian library at Oxford four. There are also several less important MSS. in the hands of private individuals; some are owned by the American missionaries in Syria. The first three volumes in the Paris library were brought from Syria in 1700 by the physician Nasr-Allah, and presented to Louis XIV. The fourth volume was procured from the private library of M. Piques, who died in Paris in 1699. These volumes contain the exposition of the doctrines of the sect by Hamza and Boha ed-Din; they were translated into French by Petis de la Croix in 1701. The Vienna, Vatican, and Leyden MSS., with two of the Bodleian, are

duplicates of parts of the Paris MSS. Two of the Bodleian MSS. are supplementary, and contain matter not found in the writings of Hamza. From a careful study of these sources, Sylvestre de Sacy (*Exposé de la religion des Druzes*, 2 vols., Paris, 1838) systematized the Druse theology. It is principally drawn from the Batenian and Ismaelite heresies, which arose within the Shiite division of Islam, in the 3d century of the Hegira, and were brought to Egypt by the invasion of the Fatimite caliphs. Traces of Gnosticism and of the Magian system of Persia are also found in the Druse writings. The characteristic dogma of the sect is the unity of God. His attributes are created and subordinate beings. He is incomprehensible, supreme, invisible, pure, the essence of true life. He can be known to his accepted children only through human manifestations. The ten Druse forms under which God has appeared are Ali, in India; Albar, in Persia; Alya, in Yemen; Moil and Kaim, in eastern Africa; Moes and Hadi, in Asia; Albu Zachariah, Mansour, and finally Hakem, in Egypt. The names are sometimes varied, but all the authorities hold that Hakem was the tenth and last earthly manifestation of God, and that no other is to be expected. He left the care of the faithful to five principal ministers, who are to direct them till the return of their divine lord. The chief of these is Hamza. His spiritual title is the "Universal Intelligence." This Intelligence, the first born of Deity, was incarnated in the person of Hamza, at the same time that Deity himself was incarnated in the person of Hakem. To him was committed the task of creation. From him comes all wisdom, all truth. He is the medium by which the Lord communicates with the lower ministers, and through them with the human family. He dispenses power, and adjusts duties in the world; and he in the last day shall be the judge and the avenger. Boha ed-Din calls him Messiah. Next to Hamza is Ismail, the "Universal Soul." His origin was the rebellion of the "Rival," which made it necessary that the Intelligence should have a supporter in the world. His office is to inspire and sanctify souls. Next to Ismail is Mohammed, the "Word," born of the union of Intelligence with Soul. He has charge of Unitarian missions, and is the spiritual cadí, the chief bishop of the sect. The functions of the fourth minister, Selama, the "Preceding," seem to have been much the same with those of the fifth minister, Moktana Boha ed-Din, the "Following;" for Selama is called the "right wing," Boha ed-Din the "left wing." Both these ministers were called three years after Hakem's disappearance. They were probably intrusted with the charge of all knowledge and teaching except that of the Unitarian religion, which must come from the higher ministers. Boha ed-Din had the special duty of organizing the Unitarian sect; he knew the retreat of Hamza, consulted with him, and

from time to time produced his commands and directions. Below these five superior ministers are three styled the "Application," the "Opening," and the "Phantom;" these ministers have each his earthly figure; they are the three feet of the candlestick which holds the candle of five elements. Beneath these are three still lower classes, called Dars, Madhums, and Mokassers, who hold their dignity only by virtue of their character and abilities; they have commission to destroy false doctrine and to communicate the truth. —The Druses hold that the most precious of substances were used for the composition of man's body, and that the world at the beginning had its perfect form. Men were made male and female, young and old, in a fixed number, and no more souls have since been created. The minister of sin, the Rival, stands between the Intelligence and the Soul, and his work of temptation is hindered by the counter work of both these celestial powers. The Druse reproduction of the story of paradise makes Enoch and Seth to be the rebellious pair whose sin entailed woe upon the race. Sin broke the unity of mankind, which the Druse religion aims to restore. The mediator is Hamza. The change which he works is not in the mind of God, but in the condition and spirit of men. He baffles Satan and remits sin, but does not strictly make an atonement. Transmigration of souls is maintained, but not through the bodies of the lower animals, as in the Indian and Pythagorean systems. In passing from body to body, good men become continually better, bad men continually worse, though it is possible for them to change and become better. Ismail Temeami, the Soul, was formerly John the Baptist, and still earlier Elijah, while the soul of Hamza was once in the body of Jesus. The souls of men until the resurrection keep the embodied form, except a few whose superior excellence permits them to exist as pure spirit. At the resurrection the bodies of the faithful will be absorbed into God's own being, and transformed into spirit; all else will be destroyed. Moral teaching is summed up in seven commandments: 1, "truth in words," meaning in practice only truth to the religion and to the initiated; it is lawful to act and to speak falsehood to men of another creed, and in defence of the Unitarian faith; 2, mutual help, watchfulness, and protection; 3, to renounce all other religions; 4, to be separate from infidels of every kind, not externally, but only in heart; 5, 6, and 7, the believer must "recognize God's eternal unity," be "satisfied with God's acts," and "be resigned to God's will." Under these seven commandments numerous minor moral precepts are given, and special crimes are prohibited. Chastity, honesty, meekness, and mercy are Druse virtues; murder, theft, covetousness, cruelty, are sins. It is the opinion of intelligent writers, who have lived with them, that the average morality of the Druses is as high

as that of any other eastern religious sect.—Of the character of the Druse worship there is but little precise information in their writings. That they have no prayer or preaching to which unbelievers can listen has given rise to the report that they are without a religion. They are divided into two classes, the *ukkal* and *juhal*, the initiated and uninitiated. The former constitute the clergy, doctors, and elders, and their chief is required to observe celibacy. They superintend the ordinances of worship and instruct the children in the elements of religion. At their meetings in the *hulwehs* (meeting houses), generally on an elevation and at a distance from the villages, they invariably place a sentry to warn them of the approach of strangers. If Moslems be present, they will produce the Koran; if Christians, the Bible; and their own religious books after the infidels are gone. Women are admitted

Druse Man and Woman.

into the order if they possess the requisite intelligence. The *ukkals* are extremely simple in their dress, wearing no silk or gold. They will not touch any money or food in any other Druse's house, from fear of its having come into his possession by unfair means. They are not salaried, but subsist by their own labor. The revenue of the estates belonging to the *hulwehs* is devoted to charity. The *ukkals* are bound to peace, although some of them will fight in war. They are generally the arbitrators in disputes, and after death the saints of their people. Their proportion to the Druse population is about one to five. The *juhals* constitute the mass of the Druses, and are instructed only in the elements of the faith. The form of government among the Druses is half feudal, half patriarchal. They are divided into three classes or ranks, the *emirs* (princes), the *sheiks* (chiefs), and the

zlaam (people). The emir appoints the *cadis* (judges), and has exclusive power over life and death; he collects the tribute, of which he pays a stated sum to the Porte, and keeps the surplus as his own. The emir's family never intermarry with the people. The sheiks direct almost despotically the government of the tribes within their jurisdiction. Some of them live in comparative state, but often their fare and habits are those of the common people, and they labor with the rest. They are often at strife with each other, but in foreign wars all the tribes unite under the leadership of the emir. It is a league of mountain barons, supporting a king elected without suffrage and governing without statute. The villages are usually placed near the entrance of passes, where they can be defended easily. The houses rise in terraces, till in some instances they reach the top of the mountain. The habits of the people are simple and primitive. Most of them till the soil; a few are artisans; the spinning and weaving are done by women in their houses, and the children of both sexes are kept at school. The method of fighting is not in masses so much as by ambush and in small bands. The Druses, if not the most numerous, are acknowledged to be the most warlike and courageous people inhabiting the Lebanon. Their code of martial honor is very precise; deceit between comrades is lasting shame, and cowardice is never forgotten. The relation of the sexes is far more honorable than among the Turks or Arabs. There is but one wife in the house, and her rights are admitted and protected; she can own personal property, retain the half of her dowry money after divorce, and is not compelled to marry against her inclinations.—The number of Druses in the whole of Syria, from the plain east of Damascus to the western coast, is reckoned to be about 70,000. Some of these dwell in scattered families in the larger towns, and in the villages of the Maronites. In the towns at the foot of Mount Hermon they make a considerable part of the population and have great influence. The Druses of the Anti-Libanus are more warlike and restless than their brethren beyond the Litany (Leontes). But the proper home of the Druse people is in the Lebanon mountains, from the latitude of Beyrout to that of Tyre. The principal towns are Deir el-Kamr, once the capital; Shweifat, near Beyrout; Heittat and Allaye; Abeh, where the American Protestants have a mission; Baklin, Mukhtara, Baruk, and Ainshalti, where also there is a missionary station.—The Druses first appear in history under their founder, Hakem (996–1021). They lived under the government of sheiks who acknowledged no superior, and made frequent raids into the neighboring countries. They were engaged in almost perpetual conflict, now with the Franks as allies of the Damascus sultan, now with the sultan himself for their own independence. In 1588 Amurath III. sent an expedition against them, under

Ibrahim Pasha, who subdued them, and one of them was appointed emir, with viceregal powers, and tributary to the sultan. These emirs gradually became more formidable, till in the beginning of the 17th century the power and ambitious policy of the emir Fakhr

policy was influenced by their dictation. Their most powerful sheik, Beshir Jumblat, was his ally, adviser, and almost his rival. The alliance between these two powerful chiefs was broken about the close of 1824, when the extortions of the emir drove the Druses into revolt, and sent Jumblat into voluntary exile. The sheiks of the various tribes rallied to avenge his cause, but were defeated. Ibrahim Pasha, son of Mehemet Ali of Egypt, attempted to invade them in their fastnesses, without success; hundreds of his soldiers fell in trying to force one of the passes. The Druses bore a part in the strife which resulted in the restoration of Syria to the Turkish sultan. In 1842 they were again in insurrection against the Turks; and more recently they have waged a harassing warfare against their rivals the Maronites. In 1860

Deir el-Kamr.

ed-Din roused the Porte to action. Fakhr ed-Din fled to Italy with a large retinue, and resigned the authority to his son Ali. A palace at Pisa was appropriated to his use, and he resided there five years, at the expiration of which he was reinstated in authority over his tribe. He extended his jurisdiction until he became the virtual ruler of nearly the whole of Syria, but was finally subdued by the armies of the sultan, made prisoner and sent to Constantinople, where he was put to death, April 13, 1635. The districts of the mountain were finally parcelled to the various sheiks, as tributaries of the pasha. About 1771 these tribes made common cause against the Arab Metualis, whose rebellion against the Turks threatened to dislodge all the tributaries of the Ottoman power. In 1811 Topal Ali, then governor of a district on the banks of the Orontes, between Latakiah and Aleppo, penetrated the mountain recesses and expelled all the Druses dwelling there; 1,500 families, the survivors, fled to the Lebanon, where they were warmly received, especially as 600 families of the latter had just emigrated into the Hauran, bordering on the Syrian desert. Invaded by the Russians, the Egyptians, and by the formidable Daher, pasha of Acre, they were driven from their homes, plundered, and dispersed. Under the bloody pasha Jezzar, though the Druses suffered, yet on the whole their relative power was increased. The emir Beshir Shehaab, though a Christian by profession, belongs to the history of the Druses more than to that of the Christians in the Lebanon. His capital was in the heart of their mountains, and his

(May-July) a great massacre of the Christians by the Druses, seconded by the Turks, took place. Zahleh, the stronghold of the Christians, was taken by stratagem, and the inhabitants were slaughtered; 8,000 men are said to have fallen. At Deir el-Kamr the Turkish governor, who had promised to defend the Christians on condition of their surrendering, betrayed them to the Druses, who slew them to a man. Then followed the massacre of Christians by the Moslems at Damascus, Sidon, &c. Here the European powers interfered. A French army landed at Beyrout, an English fleet followed, and commissioners were sent to investigate these affairs. The ringleaders were executed, and a Christian governor was appointed in the Lebanon.—The fullest account of the Druses in English is contained in Col. Churchill's "Mount Lebanon" (4 vols. 8vo, London, 1855-'62). See also "Druses of the Lebanon," by the earl of Caernarvon (London, 1860), and *Théogonie des Druses*, translated from the Arabic by H. Guys (Paris, 1863).

DRUSES. I. **Claudius Nero**, commonly called Drusus Senior to distinguish him from his nephew, the son of Tiberius, born in 38, died in 9 B. C. His mother, Livia Drusilla, was divorced from Claudius Tiberius Nero and married to the emperor Augustus three months before the birth of Drusus; and the latter, on the death of his father, was committed to the guardianship of his stepfather. His noble bearing and the liberality of his political sentiments won him early popularity, which was increased by the exploits of his maturer years. After obtaining permission of the senate to

fill all offices five years before the legal age, he acted as prætor in place of his brother Tiberius during the latter's absence in Gaul. In 15 he was made quæstor, and in this capacity he was sent against the Rætians, who were accused of having plundered subjects and allies of Rome, and whom he defeated as they were about to make a descent upon the plains of Italy. He afterward joined his brother Tiberius, and in conjunction with him thoroughly subdued this formidable tribe. In 13 he was appointed governor of Gaul, and in the following year defeated the Sicambrians, and afterward the Frisians, penetrating during this expedition as far as the German ocean, which he was the first Roman to reach. He is supposed to have dug a canal from the Rhine to the Yssel, and thus to have opened a way by the Zuyder Zee to the sea. Returning to Rome in 11, he was made prætor urbanus; but in the spring he renewed his campaigns in Gaul, subdued the Usipetes and several other tribes, and again returning, was allowed a triumph by the senate. In 10 he won new victories over the German tribes, and in 9 he was elected consul. But even this office could not keep him at Rome. He returned to Gaul, defeated the Catti, Suevi, and Cherusci, and penetrated to the Elbe. Here he determined, ostensibly on account of certain portents and omens, to retreat. He set out, but between the Elbe and the Sala (probably the Thuringian Saale) he was killed by the falling of his horse. **II. Drusus Cæsar**, commonly called Drusus Junior, son of the emperor Tiberius by his first wife Vipsania, died A. D. 23. During the life of Germanicus the court was divided between the parties of Germanicus and Drusus, and Tiberius took care not to declare which should succeed him. Drusus had not the dissimulation of his father, but he equalled him in impurity and in cruelty. He was quæstor in A. D. 10, and on his return from Pannonia in 15, whither he had been sent to quell a mutiny of the legions, he was made consul. He degraded the dignity of his office by his excesses, and Tiberius sent him with the army to Illyricum to teach him the art of war and remove him from the dissipations of the city. He successfully interfered in affairs of neighboring Germanic tribes, and an ovation was decreed him by the senate. In 22 he was promoted to the *tribunicia potestas*, which indicated him as the successor to the empire. Regarding Sejanus as his rival, Drusus one day struck him in the face, and the former persuaded Livia, the wife of Drusus, whose affections he had seduced, to become his murderer. A poison was administered to him which terminated his life after a lingering illness, supposed at the time to be a result of his intemperate habits; but the crime was confessed eight years afterward by the wife of Sejanus, who was privy to it.

DRUZES. See DRUSES.

DRYADS (Gr. *δρυς*, an oak,) wood nymphs in the Greek and Roman mythology. They are

generally considered the same as the hamadryads, and, being attached to particular trees, their life was limited by that of the tree in which they lived. Another account is that the dryads were the patrons of forests, and trees in general, and were thus distinguished from the hamadryads, who inhabited each a particular tree.

DRYANDER, Jonas, a Swedish naturalist, born in 1748, died in London, Oct. 19, 1810. He was educated at the university of Gothenburg, and took his degree of doctor in philosophy at Lund in 1776, on which occasion he published a dissertation in opposition to the theory that fungi might be the production of animals. He became the friend and pupil of Linnæus; and visiting England as a private tutor, he resided with Sir Joseph Banks after 1782 as his librarian. He was also librarian of the royal and Linnæan societies, of the latter of which he was one of the founders. He wrote several papers on botanical subjects, and superintended the publication of the *Hortus Kewensis* and Roxburgh's "Plants of the Coast of Coromandel." He was an accomplished bibliographer, and his *Catalogus Bibliothecæ Historico-Naturalis Josephi Banks, Baroneti* (5 vols., London, 1796-1800), is a model of arrangement.

DRYDEN, John, an English poet, born in the parish of Aldwinckle All Saints, Northamptonshire, Aug. 9, 1631, died May 1, 1700. He belonged to a respectable Puritan family, and his father was a magistrate under Cromwell. He was the eldest of 14 children, and received a good education at Tichmarsh and at Westminster school. At the latter he showed his poetical gifts in a translation of the third satire of Persius and an elegy on the accomplished young Lord Hastings. He graduated at Trinity college, Cambridge, in 1654, and remained there till 1657. He then went to London, where his relative, Sir Gilbert Pickering, a member of Cromwell's council, gave him a petty clerkship. He celebrated the death of the protector in his "Heroic Stanzas;" but his connection with the Puritan party was the result of circumstances rather than sympathy. The restoration called forth his *Astræa Redux* in 1660, and the coronation of Charles II. another panegyric poem. At this period he eked out the pittance from his paternal estate by writing prefaces and other occasional pieces for the booksellers. The patronage of Sir Robert Howard improved his fortunes, and he soon became known as a ready versifier and a staunch royalist. His first play, "The Wild Gallant," produced in 1662, was not successful. It was followed by "The Rival Ladies" and "The Indian Emperor;" but the plague and the great fire of London put a stop to all theatrical representations, and drove him to a less profitable employment. He busied himself in composing his "Essay of Dramatic Poesy," in which he defends the use of rhyme in tragedy. In 1663 he

married Elizabeth, daughter of the earl of Berkshire, and sister of Sir Robert Howard, a lady who added little to his fortune and less to his happiness. His *Annus Mirabilis*, "The Year of Wonders" (1667), celebrates the great fire of 1666, the duke of York's victory over the Dutch, and other prominent events. His devotion to the court no less than the merit of his verse obtained for him the appointment of poet laureate, made vacant by the death of Davenant in 1668, with that of historiographer royal, the united salaries of which amounted to £200. On the revival of the drama he became a writer for the stage, and was soon engaged to furnish for the king's theatre three plays a year, for which he received a share of the profits of the company. Though he produced only 18 plays in 16 years, the actors seem to have valued his services too highly not to take them on his own terms. But his exaggerated style did not escape the wits of the court. George Villiers, duke of Buckingham, brought out in 1671 a comedy called "The Rehearsal," in which the poet laureate was satirized under the name of Bayes. Its brilliant wit won it an enthusiastic reception. An "Essay on Satire," written by Lord Mulgrave, and attributed to Dryden, who seems indeed to have revised it, gained him the enmity of the earl of Rochester; and on Dec. 17, 1679, he was set upon at night and cudgelled by three hired ruffians. In 1681 appeared his "Absalom and Achitophel," a satire on the plot for securing the succession of Charles's natural son the duke of Monmouth, in which, under the names of David, Absalom, and Achitophel, he represented the king, Monmouth, and Shaftesbury; while in *Zinri*, who

— in the course of one revolving moon
Was chemist, fiddler, statesman, and buffoon,

he drew his old enemy, the author of "The Rehearsal," and fully repaid the smart he had felt under his satire. A medal struck by the friends of Shaftesbury to commemorate the refusal of the grand jury to indict him for high treason, furnished the theme of a fresh political satire, "The Medal," which was answered by a score of rhymesters, one of whom, Elkanah Settle, by his "Medal Reversed," is said to have fairly divided with Dryden the praises of the town. "MacFlecknoe," published about 1682, was a biting satire on the poet Shadwell, and fell below Dryden's political writings in interest only because the subject was inferior. In 1682 were produced also the *Religio Laici*, a defence of the church of England, and the second part of "Absalom and Achitophel." Of this, however, the greater portion was written by Nahum Tate; Dryden contributed only 200 lines, but in these his rivals Shadwell and Settle were handed down to the ridicule of posterity under the names of Og and Doeg. A few classical translations, some miscellaneous poems, and two pieces for the stage were his

only compositions during the next three years, until he was called upon as poet laureate to mourn the death of Charles II. and celebrate the accession of James. Under the new monarch he made profession of the Roman Catholic creed. His sincerity, as the change suited so well his worldly prospects, is a moot point. He was sharply attacked by his contemporaries, and among the earliest of his pieces in defence of his faith appeared in 1687 "The Hind and the Panther," an allegory wherein the points of difference between the two religions are discussed. The revolution of 1688 deprived him of his place, and reduced him once more to the necessity of writing for bread. From 1690 to 1694 he composed four plays, and made several translations from French and Latin. During the next three years he was busy with his translation of Virgil, for which he is said to have received £1,300. In 1698 he began his adaptations of Chaucer, contracting with a bookseller to furnish 10,000 lines for £300. This bargain produced his "Fables," consisting of many of the choice stories of Homer, Ovid, Boccaccio, and Chaucer, translated or modernized in flowing verse. The noble ode for St. Cecilia's day, often called "Alexander's Feast," formed part of this collection. It was the last of Dryden's great works. He died of mortification of the leg, and was buried next to Chaucer in Westminster abbey, where John Sheffield, duke of Buckingham, erected a monument over his remains in 1720. His wife and three sons survived him.—Dryden was reserved in his habits, but kind and benevolent. At Will's coffee house he was the oracle by common consent. He was domestic in his tastes, an affectionate father, and, notwithstanding the bitter temper of his wife, a faithful husband. The licentious spirit of the time, which his dramas did everything to encourage, found no reflex in his private conduct. His rhyming tragedies have little to recommend them; his comedies, with the exception of "The Spanish Friar," are beneath his fame; and though he wrote 27 plays, only one or two are now spoken of. Many of his dedications are disfigured by abject flattery, and his early poems are marked by the false taste, Gallicisms, and unnatural conceits which characterized the period of the restoration. It was only with the production of his first political satire that he developed his full powers and marked out a new path in which he had no rival. His bold sketches of character, wanting often in polish, but alive with individuality, have never been surpassed. From the death of Milton to his own death he was confessedly the first of the English poets; but the harmony of his verse, the happiness of his illustrations, and the brilliancy of his wit, were often defiled by the coarseness of party rancor and the taint of a corrupt fancy. Dryden produced the first good English version of the *Æneid*. In prose he has left many specimens of strong, genuine English, mostly in the form of prefaces and dedications. Among the

principal editions of his works are his dramas (6 vols. 12mo, London, 1718); miscellaneous works (4 vols., 1760); prose works, edited by Malone (4 vols. 8vo, 1800); and a complete edition of all his writings, with notes and a memoir by Sir Walter Scott (18 vols. 8vo, Edinburgh, 1808). The "Fables," ornamented with engravings after the designs of Lady Diana Beauclerc, were published in folio (London, 1797). The life of Dryden has been written by Dr. Johnson, and forms the most eloquent and discriminating of all his "Lives of the Poets."

DRYING OILS. A number of vegetable oils, as linseed, nut, poppy seed, and some others, exhibit a strong tendency to absorb oxygen from the air, and, when exposed in thin layers, to dry into a resinous kind of varnish. The addition of a small quantity of oxide of lead greatly accelerates the process. These oils are consequently well suited for mixing with coloring matters to form paint for wood work. They impart no color of their own, and serve to bind and secure the color to the wood, which they also aid to protect by their resinous coat. The so-called greasy oils have no such tendency to dry by exposure, but become rancid.

DRY ROT, an affection of timber which is often very rapidly destructive to ships, and to damp, ill ventilated houses. A general characteristic is the development of fungi, especially the *polyporus hybridus*, *thelepora puteana*, and *merulius lachrymans*, and also of lower forms. These growths are at the same time accompanied, although not necessarily in a corresponding degree, by a slow decay, akin to *eremacausis*. The only practical means of arresting dry rot is to expose the fibres of the timber to the action of certain metallic salts, or other substances which have the power of depriving the fungi of life and of so fixing the organic constituents of the wood as to prevent their oxidation. An ordinary process, long practised, is that of kyanizing (so called from being extensively employed by Mr. Kyan, at the suggestion of Sir Humphry Davy), which consists in steeping the wood in a solution of corrosive sublimate. The success of this process has been questioned, and the use of other salts has been introduced. Sir William Burnet has proposed chloride of zinc for preserving not only wood, but also canvas and cordage. Carbolic acid has been successfully employed, as also creosote, gas tar, and other coal products. Sulphate of iron and calcium chloride, in Payne's process, are much used in Great Britain. This process is as follows: Into a large cylinder several pieces of timber are introduced; steam is forced in, by which most of the air is driven out; then a cold solution of sulphate of iron is let in, which, condensing the steam, produces a partial vacuum, which is completed by the air pump. The liquid flows into the pores, and is further forced into them by pressure. The iron solution is then allowed to flow off, when steam is again introduced and applied until all or nearly all moisture in

the timber is vaporized. A cold solution of calcium chloride is then allowed to flow in; a vacuum is again produced, and the calcium salt enters the pores, and forms, by double decomposition with the iron salt, ferric chloride and sulphate of lime, or gypsum. A variation of the process has been used to stain and prepare common woods in imitation of rarer and more durable kinds.

DRY TORTUGAS, a group of ten islets or keys forming part of Monroe co., Florida, at the extremity of the Florida Keys, 120 m. W. S. W. of Cape Sable, the S. point of the state; pop. in 1870, 237. They lie just within the gulf of Mexico, in about lat. 24° 37' N., lon. 83° W. The islets, which are of coral formation, are low and barren except where partly covered with mangrove bushes. On Bush or Garden Key is Fort Jefferson, which in 1870 was garrisoned by 98 men. A lighthouse has been erected on the same islet. During the civil war the fort was used as a penal station for confederate prisoners, and in 1865 O'Laughlin, Spangler, Arnold, and Mudd, found guilty by a military commission of participation in the assassination of President Lincoln, were sent thither to serve out their terms of imprisonment, but were pardoned by President Johnson, except O'Laughlin, who died there. Prisoners under sentence of court martial are occasionally confined at Fort Jefferson.

DUALINE. See EXPLOSIVES.

DUANE, William, an American politician and journalist, born near Lake Champlain, N. Y., in 1760, died in Philadelphia, Nov. 24, 1835. At the age of 11 he was taken by his mother to her native country, Ireland, and liberally educated; but having forfeited her protection by marrying against her will at the age of 19, he learned the art of printing, and in 1784 went to India. There he amassed property rapidly, and became editor of an Indian journal entitled "The World." Having taken sides against the local government in a dispute with some of its troops, he was seized and sent to England, and his large fortune was confiscated. After in vain petitioning parliament and the East India company for redress, he became editor of the "General Advertiser," siding in politics with the party of Horne Tooke and others. In 1795 he returned to America, and became editor of the "Aurora," published at Philadelphia, making it the most influential organ of the democratic party. The change of the seat of government to Washington caused the "Aurora" to decline in political importance. Duane retired from its editorship in 1822, and travelled through the republics of South America. On his return he published an account of these travels, and was appointed prothonotary of the supreme court of Pennsylvania for the eastern district, an office which he retained until his death. He served in the war of 1812, and published a "Military Dictionary" (Philadelphia, 1810), and a "Hand-book for Rifle-men" (1813).

DUBAN, Jacques Félix, a French architect, born in Paris, Oct. 14, 1797, died at Blois in September, 1870. He studied in the school of fine arts, which in 1823 awarded a prize to his design of a custom house. After spending about five years in Italy, he completed in Paris the palace of the fine arts, which had been begun by Debret. He restored the palaces of Blois and Dampierre, and executed many works for the embellishment of the Louvre, of which he was the architect from 1848 to 1854, when he became inspector general of public buildings, and member of the institute.

DU BARRY. See **BARRY.**

DUBLIN. I. An E. county of Ireland, in the province of Leinster, bordering on the Irish sea and the counties Meath, Kildare, and Wicklow; area, exclusive of Dublin city, 348 sq. m., of which 306 are arable; pop. in 1871, including the city, 405,625. It has a coast line, inclu-

ding windings, of 70 m., comprising the natural harbors of Dublin bay, Killiney, Malahide, Rogerstown, and Lough Shinney, with harbors constructed by art at Kingstown, Howth, and Balbriggan. The only river of importance is the Liffey. The county is generally level, but on the southern boundary rises a range of hills, culminating in the peak of Kippure at a height of 2,473 ft. Near these extend the Dublin mountains, the central group of which is 1,000 to 1,200 ft. high; toward the north are picturesque valleys and cultivated heights, and on the coast are many bold promontories. The geological formation is mostly mountain limestone, bounded S. by a ridge of granite. The soil is shallow, and in general not well adapted to agriculture, but careful drainage and manuring have rendered much of it productive. The principal crops are wheat, oats, barley, rye, potatoes, and turnips. Grazing and

View of Dublin from Phoenix Park.

the fisheries form important branches of industry. Lead and copper are mined to a small extent at Ballycorrus. The manufactures are limited to stockings, cotton, and a few other fabrics. The principal towns, besides the city of Dublin, are Kingstown and Rathmines. **II.** The capital of the county and of Ireland, a municipal and parliamentary borough and seaport, situated at the head of Dublin bay, on both sides of the Liffey, in lat. $53^{\circ} 23' N.$, lon. $6^{\circ} 20' W.$, 292 m. W. N. W. of London and 63 m. W. of Holyhead; pop. in 1871, with the suburbs, 295,841; without the suburbs, 245,722. The Liffey is navigable to the centre of the city, which is divided into two nearly equal portions. Its entrance is obstructed by a sand bar, on which at low ebbs there is not more than 9 ft. of water, although in spring tides it has 24 ft. At the mouth of this river in Dub-

lin bay lies the harbor, formed by two breakwaters, one projecting E. into the bay S. of the river, the other running out from the shore beyond Clontarf, N. E. of the city, and nearly meeting the former at an angle of 40° . The area thus enclosed at high water spring tides is 3,030 acres, and by systematic dredging the channel has been so deepened as to admit vessels of 1,400 tons. The wharves and docks connected with the custom house are extensive. There is a lighthouse at the end of the S. breakwater, and in other parts of the bay are two other lights. A harbor of refuge has been constructed at Kingstown. The entrances at the port in 1871 were 7,286 vessels, tonnage 1,299,644; clearances, 3,745 vessels, tonnage 992,126. The trade of Dublin is chiefly with the midland districts, which it supplies with tea, coffee, sugar, tobacco, tim-

ber, deals, wines, and other foreign products, and with the English markets, to which it exports cattle and agricultural produce. With the United States its commerce is small, and confined mostly to timber. It has but few manufactures, and those of trifling value. Iron casting, cabinet making, and manufactures of the minor articles of jewelry and apparel are thriving, but afford employment to a very small part of the population. The manufacture of silk poplins was introduced by Huguenot refugees, and still flourishes to some extent. The well known Dublin porter is an important item in the trade of the city. The number of hogsheads exported in 1855 was 87,905; in 1862, 156,077; in 1871, 281,301. The quantity of distilled liquors exported in 1869 was 2,196 butts and puncheons, 4,520 hogsheads, 1,193 casks, and 3,268 quarter casks.—The modern part of Dublin is regularly built, without much architectural display, but with an appearance of substantiality and comfort. The lower part is occupied by filthy streets of wretched tenements, inhabited by people as poor as their dwellings. In hardly any other city are wealth and poverty in such close and marked contrast. But the general aspect to strangers who follow the main thoroughfares is very favorable. The S. W. quarter is occupied by the poor, the N. W. by the middle classes, the S. E. and N. E. being the residence of the wealthy. The thickly populated part of the city has an extent of about $1\frac{1}{2}$ m. in each direction, but with the remainder it covers a space of $2\frac{1}{2}$ by 2 m. It is paved, lighted with gas, and supplied with water by works completed in 1868. Nine bridges, of which two are of iron, span the river, and an avenue called the Circular road, 9 m. long, encompasses the city. The public buildings are noted for their elegance. The bank of Ireland, in College green, was formerly used as the Irish parliament house. It is nearly semicircular with a fine Ionic colonnade. The chamber of lords remains as when last used. Immediately opposite the bank is Trinity college, an imposing Corinthian structure. It was founded under authority of Pope John XXII., closed in the time of Henry VIII., and reopened by Elizabeth, who incorporated it in 1592 as the college of the holy and undivided Trinity. It contains a small museum, and an extensive library, rich in ancient MSS. Trinity college has a large faculty and about 1,800 students. Roman Catholics were for the

first time admitted to scholarships in 1856. The queen's university, incorporated in 1850, with power to confer degrees on students of the queen's colleges of Belfast, Cork, and Galway, holds the meetings of its senate at Dublin castle. The Roman Catholic university in Stephen's green was founded in 1854. Among the other literary and scientific institutions are the colleges of physicians and of surgeons, apothecaries' hall, and medical societies; the royal Dublin society, having museums of natural history and of agriculture, a botanic garden, a gallery of statues, a library numbering over 30,000 volumes, a school of art, and free lectures; the royal Hibernian society of art, with an annual exhibition of paintings; the royal Irish academy of science, literature, and antiquities; the royal college of science, opened in November, 1868; the archæological society, society of engineers, mechanics' institute, statistical, geological, and zoölogical societies, nu-

Trinity College.

merous other associations and reading societies, upward of 200 charity schools, and several libraries. An agricultural college at Leopardstown, near Dublin, has a farm of 200 acres. An act of parliament was passed, Aug. 10, 1854, to provide for the establishment of a "national gallery of paintings, sculpture, and the fine arts," for the care of a public library, and the erection of a public museum; and the building was begun in 1859, and opened in 1864. It forms a northern wing to the premises of the royal Dublin society, its gallery end facing Merrion square, and the corresponding southern wing being devoted to the new museum. Although entitled the national gallery, it is also intended as a testimonial in commemoration of Mr. William Dargan's exertions in behalf of the great Dublin industrial exhibition of 1853. The cost of construction was £26,739. Thirty newspapers and periodicals were published in Dublin in 1873,

among which were eight dailies. The castle, the residence of the viceroy, stands on an elevation, but is not an imposing edifice. The Four Courts are a pile of building of Corinthian architecture, with a frontage on the Liffey of 500 ft., and occupied by the courts of queen's bench, chancery, exchequer, and common pleas. The custom house is of the Doric order, and is surmounted by a cupola 125 ft. high. Other noticeable structures are the general post office, with an Ionic front, of considerable elegance; the city hall and exchange; the magnificent freemasons' hall, erected in 1868; commercial buildings, in which is the chamber of commerce; the queen's inns, linen hall, the weavers' hall, corn exchange, conciliation hall, the theatre, several barracks for constabulary and troops; Stephen's hospital for 300 patients; the Meath, city of Dublin, Sir Richard Dun's, and Richmond surgical hospitals, and royal hospital, designed by Sir Christopher Wren,

Wesleyan, 2; Wesleyan Methodist, 8; Friends', 2; Baptist, Moravian, Catholic Apostolic Church, Welsh Presbyterian, and Jewish, each 1. Among the chief streets and public places of Dublin are Grafton street, passing into College green, in which is an equestrian statue of William III., and connecting by Carlisle bridge with Sackville street, containing a column to the memory of Nelson; Dame street, containing many of the finest shops; St. Stephen's green, a square one mile in circumference, tastefully planted, and having a statue of George II.; College park, Fitzwilliam, Rutland, and Mountjoy squares. The celebrated Phoenix park comprises an area of 1,752 acres. A granite obelisk has been erected to Wellington on the left of the entrance. There is a statue of Thomas Moore, erected in 1857; and a colossal statue of Daniel O'Connell has been placed in the city hall. Among the public testimonials more recently erected in Dublin are: a fountain

St. Patrick's Cathedral.

for disabled soldiers; and St. Patrick's hospital, erected from a legacy left by Dean Swift. The county jail stands W. of the suburbs, at Kilmainham. Within the city are the Newgate, city and four courts, and marshalsea prisons, the bridewell or house of correction, Smithfield penitentiary, penitentiary for females, and house of industry. Dublin is the seat of a Protestant and a Roman Catholic archbishop, and has two ancient cathedrals of the Anglican church, those of St. Patrick and of the Holy Trinity, and a modern Catholic cathedral. St. Patrick's cathedral was thoroughly restored in 1865, at a cost of £150,000, which was defrayed by Sir B. L. Guinness. The Anglican church has 20 parish churches and 20 non-parochial places of worship; the Roman Catholics have 9 parochial places of worship, 6 friaries, a Jesuits' church, 3 monasteries, and 8 convents; the other places of worship are: Presbyterian, 6; Unitarian, 2; Independent, 3; Primitive

Wesleyan, 2; Wesleyan Methodist, 8; Friends', 2; Baptist, Moravian, Catholic Apostolic Church, Welsh Presbyterian, and Jewish, each 1. Among the chief streets and public places of Dublin are Grafton street, passing into College green, in which is an equestrian statue of William III., and connecting by Carlisle bridge with Sackville street, containing a column to the memory of Nelson; Dame street, containing many of the finest shops; St. Stephen's green, a square one mile in circumference, tastefully planted, and having a statue of George II.; College park, Fitzwilliam, Rutland, and Mountjoy squares. The celebrated Phoenix park comprises an area of 1,752 acres. A granite obelisk has been erected to Wellington on the left of the entrance. There is a statue of Thomas Moore, erected in 1857; and a colossal statue of Daniel O'Connell has been placed in the city hall. Among the public testimonials more recently erected in Dublin are: a fountain with a bust of the eminent surgeon Sir Philip Crampton, erected in 1862, at the end of College street; a full-length statue of Oliver Goldsmith, in front of Trinity college, by Foley, in 1863; statues of the earl of Eglinton, on the N. side of Stephen's green, in 1866; of Edmund Burke, by Foley, in 1868; of Smith O'Brien, by Farrell, in 1870; and of Prince Albert, by Foley, in 1872. Glasnevin is a pleasant suburb, containing the botanic garden of the royal Dublin society, and was the favorite residence of Addison, Steele, Swift, and Sheridan; and Glasnevin cemetery contains

the tombs of O'Connell, "Tom Steele," and Curran. The Royal and Grand canals flank the city N. and S., and four railways give communication with Galway, Cork, Belfast, &c. Steam packets ply regularly to Holyhead, Liverpool, London, Bristol, Cork, Glasgow, &c. The environs of Dublin are remarkably beautiful. The bay, one of the finest in the United Kingdom, is 7 m. wide at its entrance, between Howth head on the north and Kingstown on the south, and extends inland about the same distance, with a somewhat increased width. The civic government is by the municipal reform act vested in a corporation consisting of a lord mayor chosen annually from among the aldermen or town councillors, 15 aldermen, and 45 councillors, there being one alderman and three councillors from each of the 15 municipal wards. The corporate income amounted in 1871 to £196,175, the expenditure to £192,577, and the debt to £782,-

609. The city sends two members to parliament, and Trinity college two.—Dublin claims a high antiquity. Curious Celtic remains were found in 1856 within the town walls of ancient Dublin. It is the *Eblana* of Ptolemy; Irish *Dubh-linn* (black pool); Danish *Dyflin* and *Dyccelin*. About the middle of the 9th century it was taken by the Danes. The records of the next three centuries are little else than a succession of bloody battles. In 1170 it was taken by the English under Strongbow, who died and is buried there. In 1205 the castle was built; in 1190, 1283, 1301, and 1304, the city was burned; in 1405 the citizens made a descent on Wales for Henry IV. During the first half of the 16th century it was troubled by the Kildare family, one of whom, Lord Thomas Fitzgerald, among other exploits, murdered the archbishop. During Richard Cromwell's feeble protectorate the city was seized by the cavaliers, recovered by the parliamentarians, and again captured by the partisans of the king. In 1798 a conspiracy to seize the city and castle was frustrated by the arrest of Lord Edward Fitzgerald and others. In 1803 occurred Emmet's insurrection.

DÜBNER, Friedrich, a German philologist, born at Hørselgau, near Gotha, Dec. 21, 1802, died Oct. 13, 1867. In 1826 he was appointed professor in the gymnasium at Gotha, and during the five years that he held this post published philological articles in the periodicals, and especially became known by his edition of Justin. His principal studies were upon the ancient comic authors, and he resigned his professorship in order to visit Italy and collate the original manuscripts. At this time Didot invited him to Paris to assist in preparing a new edition of Stephens's *Thesaurus*, a call which the valuable manuscripts contained in the Parisian libraries induced him to accept. He was employed on the *Bibliotheca Græca* which Didot had undertaken, and contributed the critical editions of the *Moralia* of Plutarch, of Arrian, Maximus Tyrius, and Himerius, and the scholia to Aristophanes and Theocritus. He also took part in preparing the Parisian editions of St. Augustine and St. Chrysostom. In 1855 he published an elementary Greek grammar, and in 1860 a French-Greek lexicon, besides some works on education.

DUBNO, a town of European Russia, in the government of Volhynia, on the Ikva, 36 m. N. E. of Brody; pop. in 1867, 7,628. It has narrow, crooked, and unpaved streets, and belongs to the princes Lubormirski, whose residence is here. The town contains several Greek and Roman Catholic churches, a Greek abbey, and a grammar school. Its trade is chiefly in grain, flax, tobacco, cattle, and fish.

DUBOIS, a S. W. county of Indiana, bounded N. by the E. fork of White river, and intersected by Patoka creek; area, 420 sq. m.; pop. in 1870, 12,597. It has a slightly diversified surface, and is covered with thick forests; the soil is good, and coal is abundant. The

chief productions in 1870 were 120,636 bushels of wheat, 373,817 of Indian corn, 110,868 of oats, 24,796 of potatoes, 45,738 lbs. of butter, 34,738 of wool, and 358,948 of tobacco. There were 3,428 horses, 3,061 milch cows, 6,081 other cattle, 12,730 sheep, and 21,782 swine; 2 breweries, 2 saw mills, and 3 manufacturing factories of carriages. Capital, Jasper.

DUBOIS. I. Antoine, a French surgeon, born at Gramat in 1756, died in Paris, March 30, 1837. He went to Paris at the age of 20 and attended the philosophical course at the Mazarin college, supporting himself meanwhile by giving lessons in writing and by copying for lawyers. He then studied medicine under Desault, who made him his assistant. He advanced rapidly, and in 1790 became a professor in the royal college of surgery, a position in which, although he published no works, he acquired a reputation all over Europe. Bonaparte selected him as one of the corps of savants who accompanied him to Egypt, and in 1811 intrusted him with the *accouchement* of the empress Marie Louise, a service which he performed with so much skill that both mother and child probably owed their lives to him. Under the consulate and empire he was also made surgeon-in-chief of a newly established hospital, still known as the hospital Dubois, and professor of obstetrics in the maternity hospital, besides receiving the title of baron. He devised new processes in many operations, and invented and perfected a great number of instruments, among others the forceps which bears his name. His publications were confined to articles contributed to periodicals, mostly to the *Dictionnaire des sciences médicales*. **II. Paul Antoine**, a French obstetrician, son of the preceding, born in Paris, Dec. 7, 1795, died there in December, 1871. In 1823 he succeeded his father at the maternity hospital, and in 1830 was appointed professor of obstetrics in the faculty of medicine, and soon became distinguished for his skill in diagnosis, his clear and eloquent manner of lecturing, and a peculiar facility for imparting knowledge. His lectures and clinics were widely known and very fully attended. He became dean of the faculty in 1852, and in 1863 he was compelled to retire from active occupation, owing to a failure of memory, the first symptom of a mental disorder which became confirmed, and continued during the remainder of his life. His writings consisted entirely of contributions to medical journals.

DUBOIS, Guillaume, a French cardinal and statesman, born in Brive-la-Gaillarde, Limousin, Sept. 6, 1656, died in Versailles, Aug. 10, 1723. He was the son of an apothecary, went at an early age to Paris, studied in one of the colleges, and became a private teacher, and eventually tutor to the duke of Chartres, afterward duke of Orleans. He flattered his young pupil, persuaded him to marry Mlle. de Blois, a natural but legitimized daughter of Louis XIV., and was rewarded with a rich abbey in

Picardy, and sent on a mission to England. On his return to Paris he acted as private secretary to the duke; and when on the death of Louis XIV. in 1715 the duke was invested with the regency, Dubois became a member of the council, and exerted a prominent influence on foreign affairs. He concluded in 1717, in concert with Lord Stanhope, the famous triple alliance of France, England, and Holland against Spain, subsequently made a quadruple alliance by the adhesion of Austria. After becoming minister of foreign affairs, he baffled the conspiracy of the Spanish ambassador Cellamare, instigated by the Spanish prime minister Alberoni, to make Philip V. of Spain regent of France in place of the duke of Orleans. A war with Spain ensued, which resulted in the fall of Alberoni and the submission of Philip to the stipulations of the quadruple alliance. Dubois was appointed archbishop of Cambrai, and eventually cardinal, prime minister, and member of the French academy. His administration was marked by a certain degree of vigor, and he unquestionably had great ability; but his life on the whole presents a hideous array of selfishness and shameless vices. When the operations of the Scotch financier Law brought the country to the verge of bankruptcy, and while the regent was spending his time in debauchery, Dubois availed himself of the opportunity to amass an immense private fortune, derived from regular revenues, an English pension, and the benefits accruing from the six abbeys of which he was the incumbent, independent of the see of Cambrai. A record of his private life appeared in 1789, and his memoirs in 1817. Those published in 1829 are not authentic.

DUBOIS, Jean Antoine, a French missionary, born at St. Remèze, Languedoc, in 1765, died in Paris, Feb. 7, 1848. He spent 32 years in the East Indies, and on his return published "Letters on the State of Christianity in India" (London, 1823), which produced much controversy in England, because it expressed his disbelief in the possibility of the conversion of the Hindoos. He wrote several remarkable works relating to the religion and the traditions of India, and many contributions to the *Bulletin des sciences*, and to the journals of the Asiatic societies of London and Paris, of which he was a member. His most celebrated work, "Description of the Character, Manners, and Customs of the People of India, and of their Institutions, religious and civil," was published by the East India company in London in 1816, and an enlarged edition was published in French under the title of *Mœurs, institutions et cérémonies des peuples de l'Inde* (Paris, 1825).

DU BOIS-REYMOND, Emil, a German physiologist, born in Berlin, Nov. 7, 1818. He studied under Johannes Müller, succeeded him in 1858 as professor of physiology in the university of Berlin, and became in 1867 perpetual secretary of the academy. He stands at the head of the German physiologists and of the

school of positive science, and counts many distinguished savants among his followers. He is an especial authority on animal electricity. His principal work is *Untersuchungen über thierische Elektrizität* (2 vols., Berlin, 1848-'60). His *Gedächtnissrede auf Johannes Müller* (1860) contains an interesting summary of the recent progress in anatomy and physiology. Among his other works is *Voltaire in seiner Beziehung zur Naturwissenschaft* (1863).

DUBOS, Jean Baptiste, a French critic and historian, born in Beauvais in December, 1670, died in Paris, March 23, 1742. The best known of his numerous works is his *Histoire critique de l'établissement de la monarchie française dans les Gaules* (3 vols. 4to, Paris, 1734). The theory which he maintains in this work, that the occupation of Gaul by the Franks was a settlement and not a conquest, has been contested by Montesquieu and others. Of his *Réflexions critique sur la poésie et la peinture* (2 vols. 12mo, 1719; 6th ed., 1755), there is an English translation (London, 1748).

DUBOSARY, a town of southern Russia, in the government of Kherson, on the Dniester, 85 m. N. W. of Odessa; pop. in 1867, 5,547. It has two churches and a synagogue. Its trade is largely in tobacco, raised in the vicinity.

DUBOVKA, a town of southern Russia, in the government and 180 m. S. S. W. of the city of Saratov, on the Volga; pop. in 1867, 13,676. It carries on a brisk river trade in wood, grain, iron, oil, and some manufactures; much of the produce of northern Russia intended for the southern provinces is shipped here.

DUBS, Jakob, a Swiss statesman, born at Affoltern, canton of Zürich, in 1822. He studied law at the universities of Bern, Heidelberg, and Zürich, and was elected in 1847 a member of the grand council, and subsequently held various offices in his native canton. He became in 1855 a member, and in 1857 president of the federal court. He was president of the confederation in 1864, and again in 1870, having served meanwhile in the federal council. He belongs to the liberal party, and is distinguished for the reforms which he inaugurated in the administration of justice and in education. He has written *Entwurf eines Strafgesetzbuches für den Canton Zürich* (1855), *Entwurf eines Gesetzes über den Unterricht* (1857), and *Die schweizer Demokratie in ihrer Fortentwicklung* (1868).

DUBUFE. I. Claude Marie, a French painter, born in Paris about 1790, died there, April 21, 1864. He studied with David, and for many years attempted historical paintings on a grand scale, which met with little favor. In 1827 he exhibited two sentimental pictures entitled "Souvenirs" and "Regrets," which, in spite of much hostile criticism, became very popular through the medium of engravings. After executing several similar works, he turned his attention to portraits, by which he acquired reputation and fortune. He painted the likenesses of many distinguished persons, inclu-

ding Louis Philippe and his daughter, the queen of the Belgians. In 1850 two large pictures by Dubufe, representing the temptation and expulsion of Adam and Eve from paradise, were extensively exhibited in the United States. **II. Édouard**, son of the preceding, born in Paris about 1818. He studied under his father and Paul Delaroche, and for some years followed successfully the sentimental style of his father's "Souvenirs" and "Regrets." Afterward he painted Scriptural subjects, but later, following the example of his father, he confined himself more to portrait painting. Among his most successful works are portraits of the empress Eugénie, Rosa Bonheur, and the members of the congress of Paris. Two paintings called "The Conscript's Departure" and "The Soldier's Return," and a large painting of "The Prodigal Son," have been exhibited in the United States, and the last has been engraved.

DUBUISSON, Paul Ulrich, a French author, born in Laval in 1746, guillotined March 23, 1794. He went when young to Paris, and wrote for the stage with small success. He was one of the most jealous of authors, and was accustomed to fill his prefaces with abuse of the contemporary writers who surpassed him, the actors who refused to flatter him, the journalists who jested at him, and the public who neglected him. He went to America, thence to Belgium, and returned to France a few years before the outbreak, of 1789. He embraced the cause of the revolution with enthusiasm, became associated with the Jacobin club, and having taken part in the schemes of Hébert, Ronsin, and Anacharsis Clootz, he shared their fate. He published tragedies and comedies, *Abrégé de la révolution des États d'Amérique* (1778), and *Lettres critiques et politiques sur les colonies et le commerce des villes maritimes de France* (Paris, 1785).

DUBUQUE. I. An E. county of Iowa, bordering on Illinois and Wisconsin, bounded N. E. by the Mississippi, and watered by the N. and S. forks of the Maquoketa; area, 600 sq. m.; pop. in 1870, 38,969. It is hilly and well timbered, with a fertile soil. Limestone underlies the greater part of the surface. It is very rich in lead, and about 100 mines are in operation throughout the year, while in the winter three times that number are worked. The chief productions in 1870 were 495,244 bushels of wheat, 1,311,789 of Indian corn, 834,320 of oats, 75,739 of barley, 163,881 of potatoes, 37,393 tons of hay, 437,149 lbs. of butter, and 31,384 of wool. There were 8,425 horses, 10,434 milch cows, 15,034 other cattle, 9,682 sheep, and 37,232 swine. **II.** The chief city of Iowa in population, capital of the county, situated on the right bank of the Mississippi, directly opposite the boundary of Illinois and Wisconsin, and 460 m. by river above St. Louis; pop. in 1850, 3,108; in 1860, 13,000; in 1870, 18,434, of whom 6,524 were foreigners; in 1873, 22,151. The city is built partly on a terrace

20 ft. above high-water mark, and partly on the bluffs, which rise about 200 ft. The lower or business portion is regularly laid out and compactly built, while in the upper portion the streets rise picturesquely one above another. The United States building, accommodating the custom house, post office, and federal courts and officials for the northern district of Iowa, is of marble, three stories high, and cost over \$200,000. The central market building, a three-story brick edifice, surmounted by a cupola, serves both for market purposes and city offices and council chamber; the third story consists of a single room, 45 by 145 ft., known as the city hall. Three of the ward school houses are each 52 by 80 ft., three stories high, with a basement, and wings on either side, 10 by 30 ft., and cost \$25,000 each. The fourth ward school house is 70 by 50 ft., two stories high, with a basement and a large hall, and cost \$18,000. The Methodist Episcopal, one of the Presbyterian, the Universalist, the Congregational, and St. Mary's (German Catholic) churches, and the cathedral, are imposing structures, the three last being surmounted by lofty spires. The Dubuque and Sioux City, the Dubuque Southwestern, the Chicago, Dubuque, and Minnesota, the Chicago, Clinton, and Dubuque, and the Illinois Central railroads furnish means of communication to all parts. The city was made a port of delivery in 1854. In 1872 there were 62 vessels, with an aggregate tonnage of 3,606, belonging to the port, of which 17 of 1,517 tons were steamers, and 45 of 2,089 tons canal boats. Dubuque is the commercial centre of the great lead region of Iowa, N. W. Illinois, and S. W. Wisconsin. From 10,000,000 to 20,000,000 lbs. of lead, worth from \$500,000 to \$1,000,000, are shipped annually. Some of the mines are within the city limits, and the best within a few miles of it. Extensive warehouses have been erected on the levee, and large elevators for the grain trade. There are 3 national banks, with an aggregate capital of \$500,000, and 3 savings institutions, with \$350,000 capital. In 1870 Dubuque county contained 297 manufacturing establishments, chiefly in the city, employing 1,780 hands; capital invested, \$1,636,775; annual value of products, \$3,308,399. The most important were 5 manufactories of agricultural implements, 14 of carriages and wagons, 15 of clothing, 6 of furniture, 2 of iron castings, 1 of japanned ware, 1 of bar and sheet lead, 2 of pig lead, 1 of shot, 2 of engines and boilers, 4 of sash, doors, and blinds, 3 of soap and candles, 9 of tin, copper, and sheet-iron ware, 1 of tobacco and snuff, 4 planing mills, 6 saw mills, 14 breweries, 2 distilleries, and 16 flour mills. The machine shops of the Chicago, Dubuque, and Minnesota railroad, situated here, are among the most extensive in the west.—Dubuque is divided into five wards, and is governed by a mayor and a board of two aldermen from each ward, together constituting the common council. There

are also a treasurer, auditor, assessor, recorder, city attorney, and city marshal. The streets are all macadamized, provided with gutters and sidewalks, and lighted with gas, and pure spring water is carried to every part of the city from a reservoir containing 3,000,000 gallons, through 10 m. of mains. The amount in the treasury, March 1, 1872, was \$34,252 83; receipts for the year ending March 1, 1873, \$183,724 12; total, \$217,976 95. The disbursements were \$205,782 80, including \$81,088 40 on principal of debt, \$38,685 92 for interest, \$7,032 96 for poor relief, \$7,378 08 for gas, \$27,684 42 for streets, \$5,160 84 for fire department, \$5,246 20 for water department, and \$10,049 56 for salaries. The city debt is about \$900,000; the assessed value of property about \$17,000,000; true value, \$23,000,000. The schools are under the management of a board of seven directors. There are ten school houses, including one for colored children, and a high school; number of pupils enrolled in 1873, 2,880; average attendance, 2,117; teachers, 66, of whom 7 are males. The school expenditure in 1872 was \$44,132 85, which includes \$30,317 75 for teachers' wages. The German theological seminary (Presbyterian) in 1872 had 2 professors, 17 students, an endowment of \$15,000, and a library of 600 volumes. There are three daily newspapers and five weekly (two German). There are 14 churches, viz.: Congregational, Methodist Episcopal, Universalist, Roman Catholic (3), Lutheran, Dutch Reformed, Presbyterian (2), Episcopal, Christian, Old School Methodist, and one unknown.—Dubuque is the oldest settlement in the state, and derives its name from Julien Dubuque, a French Canadian, who established himself here in 1788; its permanent settlement, however, dates only from 1833, when the Indian title to the land was extinguished. It was incorporated as a town in 1837, and in 1840 a city charter was granted.

DUC, Joseph Louis, a French architect, born in Paris, Oct. 25, 1802. He entered the school of fine arts in 1821, where he took the grand prize in 1825. With Alavoine he built the column of July, and he was associated with Vaudoyer in the construction of the cathedral of Marseilles. His most noted work is the enlargement and restoration of the palace of justice in Paris, in which he was assisted by Domney. For this he was awarded by his colleagues of the academy in 1869 the grand prize of 100,000 francs, offered by Napoleon III. in 1864 for the greatest work of painting, sculpture, or architecture which should be produced within the ensuing five years. His principal competitor for the prize was M. Lefuel, the architect of certain parts of the Louvre. Out of the 100,000 francs he paid 40,000 into the treasury of the institute of France, to found an annual prize for the encouragement of architecture.

DU CAMP, Maxime, a French artist and author, born in Paris, Feb. 8, 1822. On leaving college he travelled extensively in the East in

1844-'5, and again in 1849-'51. During his last journey he made a large collection of photographic negatives of scenes in Egypt, Nubia, Palestine, and Asia Minor, which he has since published in connection with descriptive texts, in several volumes. In 1851 he was one of the five founders of the *Revue de Paris*, and he contributed to it both in prose and verse until its suspension in 1858. Besides his works of travel in the East, he has published *Les chants modernes*, poems (8vo, 1855); *Mes convictions*, poems (8vo, 1858); *En Hollande, lettres à un ami* (12mo, 1859); *Expédition des Deux-Siciles* (18mo, 1861); *Paris, ses organes, ses fonctions et sa vie* (1869). The last was contributed to the *Revue des Deux Mondes*. He has also written several romances.

DU CANGE, Charles du Fresne, sieur, a French historian and philologist, born in Amiens, Dec. 18, 1610, died in Paris, Oct. 23, 1688. He was educated in the Jesuits' college in his native city, and at the age of 13 spoke and wrote Greek and Latin freely. In 1631 he was admitted as an advocate before the parliament. But from that time he devoted himself to the study of history, and produced the *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (3 vols. fol., Paris, 1678; new and enlarged edition, 7 vols. 4to, 1844). As a companion to this, he published a glossary of the impure Greek of the middle ages (2 vols. fol., 1688). Both are works of the highest value to the student of mediæval history, and to the former the Benedictines added at different times seven volumes. Du Cange also produced a *Traité historique du chef de Saint Jean Baptiste* (4to, 1665); an annotated edition of De Joinville's *Histoire de Saint Louis IX.* (fol., 1668); and *Historia Byzantina illustrata* (1680). His published works comprise but a small part of his labors. His MSS., the number and amount of which are almost incredible, have been collected and catalogued in the university of Paris. A monument was erected to him at Amiens in 1849, and a medal was struck in his honor in 1850.—See *Essai sur la vie et les ouvrages de Du Cange*, by Léon Feugère (Paris, 1852).

DUCAREL, Andrew Coltée, an English antiquary, born in Normandy in 1713, died in London, May 29, 1785. He was educated at Eton, and at St. John's college, Oxford, and made a journey to Normandy in 1752, which supplied materials for his "Anglo-Norman Antiquities" (4to, London, 1754; enlarged, fol., 1767). This was received with great favor, and though subsequent researches have proved the inaccuracy of some of its statements, yet it is still valued for its materials, especially its descriptions and representations of some monuments since destroyed. In 1762 he was elected a member of the royal society, and the next year he was appointed, with Sir Joseph Ayloff, to put in order the state papers at Whitehall. He annually travelled with one of his friends during August, taking with him Camden's "Britannia" and a set of maps, and ex-

amined minutely all places of interest. Among his other publications were "A Series of more than 200 of the Anglo-Gallic Coins of the Ancient Kings of England, illustrated in 12 Letters" (4to, 1757); "The Histories and Antiquities of the Archiepiscopal Palace at Lambeth;" and numerous papers in the "Philosophical Transactions."

DUCAS, Michael, a Byzantine historian of the 15th century. He was a descendant of the family of the emperor Michael VII. (Ducas), and held a high position at the court of Constantine Palæologus, the last emperor of Constantinople. After the conquest of that city by Mohammed II. he took refuge with the prince of Lesbos, Dorino Gateluzzi, and by him and his successors was employed in diplomatic missions. He accompanied Domenico Gateluzzi, Dorino's son, to Constantinople, and his prudence and skill saved the independence of Lesbos. But under Nicholas Gateluzzi, the son of Nicholas, the wrath of Mohammed was called down upon the island, and it was united in 1462 to the Ottoman empire. Though Ducas survived this event, nothing more is known of his life. It is probable that he retired to Italy, and wrote in his old age the history which has come down to us. This work begins with an outline of universal chronology, and does not become detailed and truly instructive till the reign of John Palæologus I., and it terminates in the middle of a sentence at the capture of Lesbos in 1462. It is written in a barbarous style, but is judicious and impartial. It was printed at Paris in 1649, and translated into French by the president Cousin, and published in his history of Constantinople (Paris, 1672-74), and reprinted in Holland in 1685. It was edited by Bekker at Bonn in 1834.

DUCAT, a gold coin, which has been long in circulation in a large part of Europe. The first ducats are said to have been struck in the 12th century in Sicily by Roger II., and to have received their name from the device inscribed upon them: *Sit tibi, Christe, datus, quem tu regis, iste ducatus*. A little later ducats of various kinds became current in Italy, and especially in Venice; and they spread thence through Switzerland, the Germanic states, Sweden, Denmark, Holland, Spain, and Russia. In Spain, however, at present, the ducat is only a money of exchange. In Germany the ducats, being made in 1559 a legal coin of the empire, soon displaced the gold florins, and generally bore the likeness of the sovereign princes. The ducats of Austria and Holland are the only ones which have acquired a very extensive circulation. Those of Holland are the most widely spread, bearing an emblem of a knight armed cap-à-pie. This emblem was for a short time exchanged for the likeness of King Louis of Holland. The value of the ducat varies somewhat in different countries, but it is about 2½ American dollars. There are also silver ducats in France and Spain, having half this value. (See COINS.)

DUCCIO DI BUONINSEGNA, an Italian painter, flourished in the early part of the 14th century. He was a contemporary of Giotto, and one of the celebrities of the Siennese school of painting. His masterpiece, representing the Virgin and several saints, was painted for the cathedral of Siena. Among his other works was the mosaic pavement of the cathedral, part of which remains. He also excelled as an architect.

DU CHAILLU, Paul Belloni, an American traveller, born in Paris, July 31, 1835. He early went to live in the French settlement at the mouth of the Gaboon, on the west coast of Africa, where his father was a merchant, became familiar with the neighboring tribes, acquired their languages, and learned much of their habits and modes of life. In 1852 he came to the United States (of which he afterward became a naturalized citizen), and soon after published in the "New York Tribune" a series of articles on the Gaboon country, which elicited much interest. In October, 1855, he sailed from New York for Africa, with the intention of making a thorough exploration of the country on the west coast between lat. 2° N. and 2° S. He spent nearly four years, until June, 1859, among different tribes, penetrating to about lon. 14° 15' E., travelling on foot, unaccompanied by any white man, upward of 8,000 miles. During this time he shot and stuffed over 2,000 birds, of which 60 were previously unknown, and killed over 1,000 quadrupeds, among which were several gorillas, never before hunted, and probably never before seen, by a white man, and 20 other species of animals previously unclassified. He returned to New York in 1859, bringing a large collection of native arms and implements and numerous specimens in natural history. After subjecting his specimens to scientific examination in several cities, he carried them to England, where many of them were purchased by the British museum. The history of this expedition was published under the title of "Explorations and Adventures in Equatorial Africa" (8vo, New York and London, 1861; new ed., enlarged, 1871). This volume is a valuable contribution to the geography, ethnology, and zoölogy of western Africa; but many of its statements were received with distrust, principally because they were inconsistent with the maps of Barth and Petermann. A bitter controversy arose concerning Du Chaillu's truthfulness, Prof. Gray of the British museum and others attacking his veracity with much asperity, while Prof. Owen and Sir Roderick Murchison defended him. As Du Chaillu had made his observations from compass bearings only, their correctness could not be definitively proved, and he resolved to vindicate his accuracy and his reputation by a second expedition. For this he prepared himself by a course of scientific study, learned the use of astronomical and other instruments, and acquired the art of practical photography. Meanwhile his accuracy was vindicated by

the French travellers Serval and Griffon du Bellay, who, in charge of a government expedition, explored the Ogobai river and the neighboring country in 1862. His statements concerning the Fan tribe were verified by the English traveller Burton. Du Chaillu, notwithstanding his vindication, determined to prosecute his expedition, for which he had made thorough preparation. He freighted a schooner with goods for presents to the natives, and sailed from England, Aug. 6, 1863. He reached the mouth of the Ogobai Oct. 10, and there met with a severe loss by the swamping of the canoe containing his scientific and photographic apparatus. Obligated to send to England for a new supply, he occupied his time in hunting excursions, during which he again had an opportunity of studying the habits of the gorilla. In September, 1864, his instruments having arrived, he set out for the interior, accompanied by ten Commi negroes. He revisited some of the scenes of his former explorations, took many accurate observations, and penetrated among tribes and through portions of country previously unknown. He was forced to return to the coast in September, 1865, in consequence of an unfortunate conflict with the natives, in which he lost everything but his journals. These contained all of his astronomical observations, which verified his previous statements, and added much to the geographical knowledge of western Africa. He published an account of this expedition under the title "A Journey to Ashango Land" (8vo, London and New York, 1867). After spending some years in the United States, where he appeared as a public lecturer, he visited Sweden, Norway, Lapland, and Finland in 1872-3, returning to New York in December, 1873. Besides the above named works, Du Chaillu has written the following, intended for youth: "Stories of the Gorilla Country" (1868); "Wild Life under the Equator" (1869); "Lost in the Jungle" (1869); "My Apingi Kingdom" (1870); and "The Country of the Dwarfs" (1871). These narrate in detail incidents which had been more briefly mentioned in his two previous books.

DU CHÂTELET, Gabrielle Émilie le Tonnelier de Breteuil, marchioness, a French authoress, born in Paris, Dec. 17, 1706, died in Lunéville, Aug. 10, 1749. She was married at an early age to the marquis du Châtelet-Lomont, and afterward divided her time between science and dissipation. Not even a love affair with the duke de Richelieu could withdraw her from her studies. In 1733 she became the mistress of Voltaire, and the next year removed with him to Monjeu near Autun, and afterward to the château of Cirey, in which the marquis du Châtelet also resided. Here they passed several years in unrestrained freedom, actively engaged in literary pursuits, especially in the study of Newton and Locke, and the marchioness composed her *Dissertation sur la nature et la propagation du feu, Institutions de phy-*

sique, a synopsis of Leibnitz's philosophy, and various other essays. During a stay at the court of Stanislas, the ex-king of Poland, at Lunéville, she fell in love with the marquis de Saint-Lambert, by whom she had a daughter, and a few days after giving birth to this child she died in the palace of Lunéville. Several of her works were published posthumously, including *Principes mathématiques de la philosophie naturelle*, a translation of Newton's *Principia*, with a commentary (1756); *Doutes sur les religions révélées, adressés à Voltaire* (8vo, 1792); and *Lettres inédites à M. le comte d'Argental* (12mo, 1806).

DUCHÉ, Jacob, an American clergyman, born in Philadelphia in 1739, died there in January, 1798. He graduated at the college of Philadelphia in 1757, and completed his education at Cambridge, England. In 1759 he was ordained an assistant minister of Christ church in Philadelphia, of which in 1775 he became rector. By sermons delivered before congress and before the patriots of the army, he established his character both for eloquence and patriotism; and being in 1776 chosen chaplain to congress, he gave his salary for the relief of the families of those who had fallen in battle. But in 1777 he addressed a letter to Washington in which he pictured the hopelessness of resistance, and urged him to cease his desperate and ruinous efforts. Washington transmitted the letter to congress. Duché fled to England, and his estate was confiscated. He returned to America in 1790, but never regained influence or position. He published while in London two volumes of sermons, written in an easy and elegant style, which passed through several editions.

DUCHESNE, André, a French historian, born in Île Bouchard, Touraine, in 1584, died in 1640. He was geographer and historiographer to the king. On his way from Paris to his country seat he was run over by a cart and killed. Besides his published works he left more than 100 volumes in manuscript. Among the most important of the former are *Historia Normannorum Scriptores Antiqui* (fol., Paris, 1619); *Historia Francorum Scriptores* (3 vols. fol., 1636-'41); and some genealogical histories.—His son **FRANÇOIS**, born in Paris in 1616, was also historiographer to the king, and wrote a history of the popes (2 vols. fol., 1653). He died in 1693.

DUCHESNE DE GISORS, Jean Baptiste Joseph, a French miniature and enamel painter, born in Gisors, Dec. 8, 1770, died there, March 25, 1856. He removed to Paris at an early age, and after the restoration of the Bourbons became court painter. His miniatures of Napoleon I. and of the duchess de Berry are remarkable specimens of the art. He was much employed by the royal families of England and Belgium, and between 1840 and 1848 was engaged in continuing the series of paintings on enamel in the Louvre commenced by Petitot. He also executed a series in enamel for Queen

Victoria after the miniatures of Sir William Ross. Some of the latter, painted in his 82d year, are of the highest excellence.

DU CIS, Jean François, a French poet, born in Versailles, Aug. 22, 1733, died there, March 31, 1816. His first publication was the unsuccessful tragedy of *Amélie*. He afterward adapted several of the plays of Shakespeare to the French stage with considerable success. Of his original dramatic works the best is his *Abufar, ou la famille arabe*. In the latter part of his life he wrote some shorter poems. He refused the place of senator offered him by Napoleon, though he was at the time in great poverty. His works were published in Paris in 1819, in 3 vols.

DUCK, a name applied to birds of the family *anatidæ*, of the order *natatores*, and suborder *anseræ*. They have the bill large and flattened, covered with a soft epidermis rather than horn, and with its sides armed with small tooth-like processes; the tongue is fleshy, with dentated margins; the wings are moderate; the feet at or near the centre of equilibrium; the anterior toes joined by a web; the neck is long. The number of vertebræ is large, especially in the neck; the sternum and pelvis are large and wide, the former with a well developed keel, and posteriorly with two openings or deep indentations; the fibula is somewhat movable. The gizzard is fleshy and large; the intestines are about five times as long as the bird, and the caecal appendages often one third as long as the body; the trachea and inferior larynx generally bulbous. The ducks are divided into three subfamilies. I. The *anatinae*, or river ducks, have the bill equal in width and height, depressed at the tip, which has a hard nail, and the inner portion of the lateral margins lamellated; the tarsi are compressed, and generally as long as the inner toe; the hind toe is bordered with a slight membrane from base to tip. These ducks prefer fresh water, feeding along the edges of streams, eating small mollusks and soft aquatic plants; some feed on the land, and roost and build their nests in trees; they are powerful fliers, and have a wide geographical range. In the genus *dafila* (Leach) is the pin-tail duck (*D. acuta*, Jényns), having the bill lead-colored with a black spot at the tip, a long slender neck, the wing speculum of a purple or coppery red with deep green reflections and black border, the feathers with broad white tips, and a long and pointed light gray tail, dark brown in the middle; in the adult male the head, cheeks, throat, upper part of front neck, and sides are dark brown; a small part of hind neck dark green, almost black; the upper parts in general undulated with narrow bars of brownish black and yellowish white; wings grayish; upper tail coverts cream-colored; an oblique white band on the side of the neck; lower parts white, undulated like the back or the sides, and lower tail coverts black, white-edged at the side. The female and

young are variegated with brown and brownish white; the speculum is dusky green, and the long tail feathers are wanting; they are sometimes called gray ducks. The male is about 29 in. long to end of tail, extent of wings 36 in., weight about 2 lbs.; the females are smaller. It is most commonly seen on the inland ponds of the west and south of the United States from early autumn to spring, in company with teals, widgeons, and mallards; the breeding place is in the far north, in passing to and from which the birds are seen on the coast. They are very graceful on the water, rarely dive, and are less shy than most others of the family. A favorite article of food is the beech nut; they will also eat tadpoles, leeches, insects, and even dead animal matter; the flesh is much esteemed for food. Several species are found in South America, Europe, Africa, and Asia, migrating to temperate regions from the north. The typical genus *anas* (Linn.) includes the mallard or common wild duck, the origin of the domesticated species. The

1. Scaup or Broad-billed Duck (*Fulix marila*). 2. Pin-tailed Duck (*Dafila acuta*). 3. Mallard Duck (*Anas boschas*).

mallard (*A. boschas*, Linn.) has a bright purple speculum with green reflections and black border, the secondaries broadly tipped with white, and the secondary coverts with white ends and black border; the head and neck deep green, a white ring around the middle of the neck; the breast reddish brown; fore part of back light brown, the rest darker, and rump black with green reflections; upper surface of wings grayish brown; sides and lower parts pale gray with dusky bars; the length is about 24 in., extent of wings 36, and weight 2½ to 3 lbs.; the females are smaller, brownish, with a less brilliant speculum and the head and neck with dusky streaks. This species is smaller but more beautiful than the domestic races which have sprung from it; the wild bird may be known from the tame by its soft and pliable feet, which in the latter become hard and wider from walking over gravel and roads. The mallard is abundant from New York southward and west-

ward, being replaced to the northward, according to Audubon, by the velvet duck (*oidemia fusca*, Sw.); it is rarely seen on salt water, except when migrating. The flight is strong and rapid, easily commenced from land or water; when alarmed it utters many loud quacks. It devours anything eatable, even carrion and small animals that come in its way. Besides man, its principal enemies are hawks and owls, the raccoon, the lynx, and the snapping turtle. The flesh of the young birds is much esteemed; the large hybrids from the mallard and Muscovy duck are excellent for the table; this species also breeds with the black duck and the gadwall, the latter hybrid being very handsome, retaining the yellow feet and barred plumage of the one and the green head of the other parent. In the black or dusky duck (*A. obscura*, Gmel.) the speculum is green, with purple reflections and black border, and the secondaries are tipped with white. In shape and habit it resembles the mallard; the flesh of the young birds is excellent, and the feathers are soft and elastic. The shoveller duck (*spatula clypeata*, Boie), or spoon-bill, has the bill twice as broad at the end as at the base, much rounded, the sides at the base resembling the teeth of a fine comb; the head and neck are glossy green, upper part of breast white, rest of lower parts chestnut, except the lower tail coverts, and a black band across the vent; sides yellowish with dark pencillings; secondaries greenish, the inner with terminal white spots; primaries dark brown, with white shafts; lesser wing coverts light blue; speculum golden green; rump greenish black, white at the sides; tail dark brown, with pointed feathers broadly edged with white; length about 21 in., extent of wings 32, weight $1\frac{1}{2}$ to $1\frac{3}{4}$ lb. It associates with teals, mallards, and gadwalls, and is omnivorous; its flesh is much prized, and Audubon says that no sportsman who is a judge will pass a shoveller to shoot a canvas-back; it is comparatively rare, and is most common in the southern and western states. The Australian genus *malacorhynchus* (Sw.) is nearly allied to the shoveller. The Muscovy (*Cairina moschata*, Flem.), more properly called musk duck, is distinguished by the red tubercle or carbuncle on the top of the bill at the base; the color is glossy black with the wing coverts white; by its lobed hind toe it connects the river ducks with the next subfamily. It is about 33 in. long; it has an odor of musk, proceeding from the coccygeal glands, which is communicated to the flesh; in its pure state it is difficult to raise, but it breeds well with the mallard, and in this domesticated state its plumage is more white, and the musky odor is absent. It is supposed to have come originally from South America, whence it has spread over the world. To the river ducks belong the genera *tadorna* (Leach), the European sheldrake, this name in America being applied to a merganser; *Aix* (Boie), the wood or summer duck; *mareca*

(Steph.), the widgeon; *querquedula* (Steph.), the blue-winged teal; *nettion* (Kaup), the green-winged teal; and *chaulelasmus* (Gray), the gadwall. These will be described under their respective common names. II. The sea ducks, or *fuligulinae*, have the bill higher than broad, depressed at the tip, which is armed with a broad strong nail; the wings are moderate and pointed, the tail generally short and wedge-shaped, the tarsi compressed and much shorter than the middle toe; the toes long and united by a full web, the outer as long as the middle; the hind toe short, with a deep membranous web. These ducks are generally marine, feeding on mollusks and small fish, which gives to their flesh a strong flavor; most are excellent fliers. The genus *fulix* (Sundev.) includes the scaup duck and the ring-neck. The scaup duck (*F. marila*, Baird) has the head, neck, fore part of back, and breast black, glossed with purple and green, and the last two tinged with brown; the rest of the upper parts and abdomen brownish black; the middle back, scapulars, secondaries, front of abdomen, and sides grayish white, with undulating fine black lines; middle of breast white; wings light brownish gray; speculum on the brownish black secondaries white; the length is about 17 in., extent of wings 29, and weight $1\frac{1}{2}$ lb.; the females are brown and white. This duck, which is called broad-bill and blue-bill, is found along the Atlantic coast and also on the western rivers; it arrives from the north in October in large flocks, which at first may be easily decoyed; when wounded, it is very difficult to obtain on account of its diving, and from its fishy taste is hardly worth shooting; its flight is rapid and high. The ring-necked duck (*F. collaris*, Baird) has a tufted head, which with the upper neck is greenish black, with purple reflections; on the neck is

1. Old Wife (*Harelda glacialis*). 2. Buff-necked Duck (*B. albeola*). 3. Harlequin Duck (*Histrionicus torquatus*).

a brownish red ring, widest in front; a triangular white spot at the base of the lower mandible; upper parts generally brownish black, lower parts grayish white; outer secondaries

with slate-colored webs, tipped with white; tail brownish gray; the length is about 18 in., and the extent of wings 28. The female has a white band on the forehead, upper parts brownish, below white. It is met with on the coast and in the interior; it swims, dives, and flies well; its flesh is said to be excellent. Other species are found in the northern parts of Europe and Asia, and one in New Zealand; the European tufted duck is the *F. cristata*. The genus *aythya* (Boie), including the canvas-back (see CANVAS-BACK), which by some authors is put in the preceding genus, is represented here also by the red-head (*A. Americana*, Bonap.); this species has a bluish bill, black toward the end; in general appearance it resembles the canvas-back, except that the head and upper neck all round are dark chestnut, and the back is grayish brown, barred with fine white lines; the length is 20 in., extent of wings 33, and weight 2½ lbs.; in the female the head and neck are brown like the back. The red-head, like the canvas-back, is very common in the Chesapeake, but is rare north of New York; its flesh is as good as that of the canvas-back, and it is often sold for it to the inexperienced; it arrives about November, leaving for the north to breed in early spring. The genus *bucephala* (Baird) contains several well known species, among them the golden-eyed duck (*B. Americana*, Baird); this bird has a black bill, with a white spot between the base and eye; head with a crest of feathers more than an inch long; iris bright yellow; head and upper neck rich green with purple reflections; rest of neck and plumage generally white; back and wings blackish, with a patch of white on the latter formed by the secondaries and tips of the coverts; sides of rump grayish; the length is 20 in., extent of wings 31, and weight about 2½ lbs.; the female is dull brown above, white below, with dusky wings. This species arrives with the other sea ducks in the autumn from their breeding places in the north; it is found from high arctic latitudes to Florida, both on the coast and in the interior; its food consists of mollusks, crustaceans, and small fish, which it procures by diving. Its flight is strong and very rapid, accompanied by a sound which has caused this bird to be called whistler; the flesh has a fishy taste, which is relished by some; though shy and difficult to approach, it will generally alight at the decoys of the gunner on the coast. The buff-head or spirit duck (*B. albeola*, Baird) is a miniature representative of the golden-eye; the bill is blue; the head crested; a patch behind the eye, going over the head, and band on the wings, white; rest of head and hind neck glossy green, with purple reflections; fore neck, breast, and sides pure white; abdomen dusky white; tail and upper coverts grayish brown; back and wings black, the latter with a white patch; length 14½ in., extent of wings 23, weight 1 lb.; the female is sooty brown above, breast and abdomen soiled

white, fore neck ash-colored, with a white band on the sides of the head. This duck receives its common name from the disproportionate size of the head compared with the body; from its diving habits it is also called dipper; the flight is very rapid, and its distribution extensive; its flesh is fishy. The harlequin duck (*histrionicus torquatus*, Bonap.), beautiful and singularly marked, is much prized as a cabinet specimen; the bill is yellowish olive; a broad black streak passes over the top of the head, margined with reddish brown; front of the eye and a spot behind it white; a slightly curved white line on the neck; sides of head and neck purplish blue; a complete ring of white below the middle of the neck; a band of white in front of the wing, passing on the breast, edged with black; fore back light blue, becoming black behind; scapulars white, and secondaries tipped with the same, forming a bar on the wings; fore breast light blue, abdomen brownish; quills dark brown, tail grayish black; under the tail at base a white spot; the length is 17 in., extent of wings 26½, and weight 1½ lb.; the female is grayish brown. It is rare on the coast south of Massachusetts, but common to the north, especially in the British provinces; it is shy, an excellent flier and diver, difficult to obtain, and not much prized as food. The long-tailed duck (*harlelda glacialis*, Leach), called also "old wife" and "old squaw," has the bill black at the base, orange yellow at the end, with a bluish gray nail; iris carmine; a grayish white patch from the bill to behind the ear; upper part of head and nape black, narrower in front; neck all round and fore breast chocolate-brown; back and wing coverts brownish black; scapulars margined with light brown. This is the male summer plumage; in winter, the head, neck, fore back, and scapulars are white; upper parts brownish black, as are the four middle tail feathers; lower parts and the outer tail feathers white. The two median tail feathers extend several inches beyond the others; length to end of tail feathers 23 in., and extent of wings 30. The feathers are dense and blended; in the winter it is found in all the Atlantic districts; it is timid, a swift flier and ready diver; the flesh is tough and fishy. The pied duck (*camptolemus Labradorius*, Gray) has the wing coverts and secondaries white, forming a large patch on the wings; the cheeks are furnished with bristly feathers; the bill is orange at the base, black at the end, with the sides of the upper mandible very thin, and the under deeply serrated; a black band on the top of the head; rest of head and upper neck white; in the middle of neck a broad black ring, the same color passing down the back; lower neck white; upper breast and sides black; lower plumage brownish black, as are the primaries and their coverts; the length is 20 in., extent of wings 30, and weight nearly 2 lbs.; the female is bluish gray above, ash-gray below, with secondaries and sides

of head white. This species, called the skunk and sand-shoal duck, does not seem to go further south than Chesapeake bay; it is essentially marine, rarely entering rivers; it procures by diving over sand bars shell-fish and small fry; its flesh is not considered a delicacy. The genus *somateria* (Leach) contains the eider and the king duck, which will be described under the former title. The genus *oidemia* (Flem.) includes those sea ducks which are erroneously called coots in New England. The velvet duck (*O. fusca*, Sw.) has the plumage generally black, with a spot under the eye and a large patch on the wings, formed by the secondaries, white; hence the name white-winged coot; the base and sides of the bill black, the sides bright red, and the nail orange or flesh-colored; iris bright yellow; the length is 22 in., extent of wings 39, and weight about $3\frac{1}{2}$ lbs.; the female is sooty brown, the lower parts lighter. These birds are seen in large flocks in autumn along

general color of the plumage is black, bluish on the hind neck, the scapulars tinged with green; tail graduated; the length is 19 in., and the extent of wings about 32. This associates with the other species of the genus. The *O. nigra* (Flem.) is a European bird. It is probable that the American scoters, like other birds breeding in the far north, are occasionally seen in Europe. III. The spiny-tailed ducks, *erismaturinae*, have the bill elevated at the base and depressed at the tip, with a nail; the wings are short and concave, with the ends of the quills incurved; the tail is lengthened, of narrow, rigid feathers, slightly protected with coverts above and below; the tarsi are shorter than the middle toe, compressed; the toes long, united by a full web, the hind toe long, with a broad web. These ducks are short fliers from the smallness of their wings, and their geographical distribution is not extensive. In the genus *biziura* (Leach), peculiar to Australia, a large compressed wattle hangs from the lower mandible; the wings are very short, and furnished with two blunt tubercles at the shoulder. The best known species is *B. lobata* (Shaw). The ruddy duck (*erismatura rubida*, Bonap.) has a grayish blue bill, the iris hazel, and the eye situated very high up; upper part of the head black, terminating in a point behind; sides of the head white; chin with a yellowish brown tinge; upper parts and sides reddish brown; lower parts white, with dusky bars; the tail black, short, and rounded; wings blackish brown; the length is 15 in., extent of wings 22, and weight $1\frac{1}{2}$ lb. The plumage varies much at different ages. It is common in Chesapeake bay, where it is called salt-water teal; it is found all along the coast and on the Ohio and Mississippi rivers. It is an excellent diver, but is by no means shy; when young and fat the flesh is tender and of good flavor. The saw-bill ducks will be described under MERGANSER, to which subfamily they belong.—The domestic duck is derived principally from the mallard, mixed in some cases with the musk duck and the gadwall, and perhaps the black duck. The variety considered the best here is the Aylesbury duck, from the town of that name in Buckinghamshire, England; many thousand pounds sterling worth of ducks are sent annually to London from this place, and almost all the broods are hatched under hens, as being more certain sitters; the most prized are pure white, with pale bill and legs. The advantages of this breed are their great size and productiveness; they are early layers and good hatchers, and easily raised; besides they are ornamental, with fine, white, downy feathers, pure skin, and white, delicate, and savory flesh; at the age of 8 months a pair should weigh from 10 to 12 lbs. The large Rouen duck, originally from France, very prolific in eggs, is about 30 in. long; the back is sooty black; it is generally believed to be a half domesticated species escaped from man's restraint, and again subjected to him; it breeds readily with the

1. Pied Duck (*Camptolemus Labradorius*). 2. Ruddy Duck (*Erismatura rubida*). 3. Surf Duck (*Oidemia perspicillata*).

the Atlantic coast, when they are shot in great numbers from boats near the shore; on account of the density of the plumage they require a heavy charge to kill them; though breeding in lakes and rivers, they are rarely seen during migration away from the sea. The flesh is dark, with a fishy flavor. The surf duck (*O. perspicillata*, Linn.) has a bill of a reddish orange color, paler on the sides, with a black patch at the side of the base of the upper mandible; the plumage is black, except a white patch on the crown and hind neck; the eyes white; legs and feet reddish orange; the length is 20 in., extent of wings 33, and the weight $2\frac{1}{2}$ lbs.; the female has a brownish tinge to the black plumage. This also is called coot, and associates with the preceding species, which it resembles in its habits; it is frequently called black duck; it is shy, and difficult to shoot except on the wing; the flesh is tough and fishy. The American scoter, or butter-bill coot (*O. Americana*, Sw.), has a bill of a deep orange color at the base and black at the end; the

common variety. Other varieties are the Flemish crested, black and white Poland, and Silesian ducks; the musk duck is a distinct species. The Chinese rear immense numbers of ducks, which are hatched by artificial heat applied to the eggs placed in boxes of sand; they are fed with boiled crawfishes and crabs cut in small pieces and mixed with boiled rice; they are kept in boats, 300 or 400 in each, going out to feed in the morning, and returning when wanted at the voice of their master.

DUCK HAWK. See FALCON.

DUCLOS, Charles Pineau, a French author, born in Dinan, Brittany, Feb. 12, 1704, died in Paris, March 26, 1772. The first work which gained him reputation was his *Histoire de la baronne de Luz* (1741). His *Histoire de Louis XI.* was suppressed by the government in 1745. In 1750 he became historiographer of France. A collection of moral essays, entitled *Considérations sur les mœurs de ce siècle*, is the chief basis of his reputation. His writings have been collected and several times republished (10 vols. 8vo, Paris, 1806; 3 vols. 8vo, 1821).

DU CORNET, Louis César Joseph, a French artist, born in Lille, Jan. 10, 1806, died April 27, 1856. He was born without arms, but learned in childhood to make his feet perform all the ordinary offices of hands. He had conceived a taste for painting, and so much astonished Watteau, professor at the school of design in Lille, by the drawings which he executed with his toes, that at the age of 13 he was received into the school as a pupil. Three years later he obtained the first prize for a drawing of the human figure from nature, on which occasion his native city settled upon him a pension of 300 francs, which was increased by the government to 1,500. Pursuing his studies in Paris, he produced in 1828 his "Parting of Hector and Andromache," which he presented to the city of Lille. After the revolution of 1830 his pension was withheld. One of his last works, "Edith finding the Body of Harold" (exhibited in 1855), was painted for Napoleon III. Ducornet was not only destitute of arms, but there were certain malformations in his lower limbs which seemed to present insurmountable obstacles to the acquisition of proficiency in his art. He nevertheless used his brushes with remarkable dexterity, passing them from one foot to the other with rapidity, and making the most delicate strokes with perfect ease and accuracy. He had but four toes on each foot, but the wide space thereby left between the great toe and the next one rather facilitated the operation of painting. He was vivacious, and in an animated conversation was in the habit of gesticulating with his legs.

DUCROT, Auguste Alexandre, a French general, born in Nevers in 1817. After receiving his education at St. Cyr, he served for many years in Algeria, and subsequently in Italy. In 1865 he was promoted to the rank of general of division, and in 1869 was put in command of the 6th division, quartered at Strasburg. Du-

ring the ensuing war he was attached to the forces of MacMahon. In the attempt at effecting a junction with Bazaine in Metz, he was the first to reach the Meuse. On Sept. 1 he fought valiantly at the battle of Sedan, and when MacMahon was wounded he received from him the command in chief. He intended to retreat toward Belgium, but was prevented by the arrival of Gen. Wimpffen, who took command in accordance with precautionary orders brought from the minister of war. After the surrender Ducrot refused to accept the favors extended to the French officers, and was put under arrest at Pont-à-Mousson. He escaped soon after, and reaching Paris obtained command of the 13th and 14th corps, with which he fought the bloody but indecisive battles of Rueil, La Jonchère, and Buzenval. At the close of November and the beginning of December he operated with the second army in the great sorties S. of Paris and on the Marne, but failing in his enterprises, he withdrew to the woods of Vincennes. He also participated in the last and disastrous sortie of Jan. 19, 1871. After the capitulation he was elected to the national assembly, but was not reelected. In 1872 he was made commander-in-chief of the 8th army corps. In 1871 he published *La journée de Sedan, De l'état-major et des différentes armées*, and *La vérité sur l'Algérie*.

DUCTILITY (Lat. *ductilis*, easily led, from *ducere*, to draw), one of the specific properties of solids, which allows them to be drawn into wire or filaments. Malleability is often regarded as a modification of ductility, but the more ductile metals are not always the most malleable. Iron, for instance, is very ductile, standing near the head of the list, but its order of malleability is much lower. The following eight metals are named in the order of their ductility: gold, silver, platinum, iron, copper, zinc, tin, lead. The same metals have the following order of malleability: gold, silver, copper, tin, platinum, lead, zinc, iron. Platinum is sometimes spoken of as the most ductile metal. This is because it is practicable, by enclosing it in a cylinder of silver, drawing the two together, and then dissolving away the silver with nitric acid, to obtain a finer wire than by any other process. Wollaston obtained in this manner a wire of platinum only $\frac{1}{30,000}$ of an inch in diameter.

DUDDON, a river of England, rises near the stones which mark the junction of Cumberland, Lancashire, and Westmoreland, flows 10 m. in a S. direction, and falls into the Irish sea by a broad estuary, forming at low tide an immense surface of land flats.

DU DEFFAND, Madame. See DEFFAND.

DUDEVANT, Amantine Lucille Aurore Dupin, a French novelist, better known as George Sand, born in Paris in July, 1804, died June 8, 1876. Her father, Maurice Dupin, died when she was scarcely four years old, leaving her to the care of her grandmother, the countess de Horn, who was the illegitimate daughter of

Marshal Saxe, the illegitimate son of Augustus II., king of Poland, and of the countess Aurora de Königsmark. She received her first education at the family country seat of Nohant, near La Châtre, where she led a somewhat eccentric life. After spending about two years at a boarding school in Paris, she returned to Nohant in 1820, and on the death of her grandmother a few months later lived with friends in the vicinity of Melun. Here she became acquainted with Casimir Dudevant, whom she married in September, 1822. The young couple took up their abode at Nohant, but found that their tempers, habits, and tastes could not harmonize, and the estrangement was embittered by pecuniary embarrassments. In 1831 Mme. Dudevant, desirous of trying her fortune as a writer, obtained permission of her husband to pass three months out of every six in Paris. She contributed a few articles to *Figaro*, but not possessing the extemporaneous facility requisite for a journalist, she found herself dependent upon the allowance of 1,500 francs paid by her husband. In order to reduce her expenses, and to visit unnoticed the public galleries, libraries, and theatres, she assumed male attire. Meanwhile she wrote a novel in conjunction with her friend Jules Sandeau, entitled *Rose et Blanche*, and bearing the name of Jules Sand, which was received favorably enough to encourage the publisher to take another from the same hands. Sandeau had nothing ready, but his associate had just completed *Indiana*, which appeared in May, 1832, under the name of George Sand, and had a brilliant success. A rumor that the author was a woman added to the interest created by *Indiana*. This was soon followed by *Valentine*, a more perfect production, which was also eagerly received. "George Sand" became then a favorite novel writer for the *Revue des Deux Mondes*. In 1833 she produced *Lélia*, which caused a profound sensation by seeming to advocate principles of infidelity and social disorder; and from this time the author was looked upon with suspicion by many of her former admirers. To recruit her health, she now started for Italy in company with Alfred de Musset, the poet; but they separated in Venice, he returning to France and she remaining and writing *Jacques, André*, and *Les lettres d'un voyageur*. On her return to France in the beginning of 1835, she met the eloquent lawyer, Michel de Bourges, who drew her into politics, Lamennais, with whom she debated questions of religion, and Pierre Leroux, who initiated her into the doctrines of socialism. Their influence was perceptible in several of her works, such as *Simon, Spiridion*, and *Consuelo*, and the continuation of the last named work under the title of *La comtesse de Rudolstadt*. The difficulties with her husband had increased, and she obtained a decree by which she was separated from him and restored to the management of her own fortune and the guardianship of her children; after which she

made Nohant a resort for her friends, and attended to her children's education. In 1838 she spent a winter in Majorca, where she was accompanied by the pianist Chopin, her relations with whom continued till 1847. In 1845 she began to write pastoral novels, including *François le Champi* (first produced as a play in 1849), *La petite Fadette*, and *La mare au diable*. The revolution of February, 1848, brought her again into the political arena, and she is said to have upheld with her pen many of the measures of Ledru-Rollin, then a member of the provisional government; but a few months afterward she returned to her country seat and her wonted occupations. In 1854 she published in the *Presse* newspaper an autobiography, entitled *Histoire de ma vie*, which contains few incidents of her life, but is a history of her mind and heart. She published, either in book form or in journals, about 60 novels, more than 20 plays, some of which are adaptations from her novels, and many minor works. Her plays have met with less favor than her novels; but *François le Champi*, *Le mariage de Victorine* (1849), *Les beaux messieurs de Bois-Doré* (1862), and especially *Le marquis de Villemer* (1864), have been very successful. Many of her novels have been translated and published in the United States. Among her latest publications are *Journal d'un voyageur pendant la guerre* (1871), a highly interesting diary, first contributed in parts to the *Revue des Deux Mondes* during the late war, and *Impressions et souvenirs* (1873).

DUDLEY, a town, parish, and parliamentary borough of Worcestershire, England, but locally comprised in Staffordshire, which entirely surrounds it; pop. in 1871, 43,781. The town stands on a hill about 8 m. W. N. W. of Birmingham, and contains four churches and a number of chapels. The charitable foundations, such as free schools, infirmaries, and industrial schools, are numerous. In addition to these it has a grammar school founded in the reign of Elizabeth, many literary and scientific societies, and a museum of natural curiosities. The neighborhood furnishes abundance of coal and almost inexhaustible supplies of iron. Iron founderies, blast furnaces, and iron mills are numerous, employing many thousand persons. The chief manufactures are chains, anvils, vises, fire irons, grates and fenders, edge tools, files, nails, and agricultural implements. There are also brass founderies, glass works, brick and cement works, tanneries, and an extensive brewery. The limestone quarries of the neighborhood are remarkable. The stone is usually excavated from the solid rock, leaving vast caverns, the roofs of which are supported by limestone pillars. One of these caverns is 2 m. long, and traversed by a canal by which the stone is conveyed away. On an eminence near here are the ruins of a strong castle, said to have been built in the 8th century by Dudo, a Saxon prince. In 1644 it was garrisoned by a

body of royalists under Col. Beaumont, and held out for three weeks against the parliamentary forces.

DUDLEY, the name of an English historical family, descended from John de Somerie, who acquired the castle and lordship of Dudley in the reign of Henry II. The barony passed by marriage from the house of Somerie to that of Sutton in the reign of Edward II. John Sutton (Lord Dudley, died in 1487) was distinguished in the wars of the roses, and left two sons, Edward and John. A grandson of the latter was Edmund Dudley, the extortionary minister of Henry VII., who was executed for high treason under Henry VIII. (Aug. 18, 1510). His son John Dudley (1502–1553) was created Viscount L'Isle by Henry VIII. (1542), earl of Warwick by Edward VI. (1547), and after effecting the ruin of the duke of Somerset was made duke of Northumberland (1551). He persuaded the young king Edward to set aside his sisters Mary and Elizabeth from the succession, and bequeath the crown to Lady Jane Grey, who belonged to a branch of the royal family, and had married Lord Guilford Dudley, a son of Northumberland. The attempt proved a failure, and Northumberland perished with his son and daughter-in-law on the scaffold. His son Ambrose (1530–1589), usually called the good earl of Warwick, to which dignity he was restored by Elizabeth (1561), served in youth in the Netherlands, and was a distinguished ornament of the English court. He died childless. — **ROBERT**, earl of Leicester, younger brother of the preceding, the favorite of Queen Elizabeth, born about 1531, died in Cornbury, Oxfordshire, Sept. 4, 1588. He came early into the service of Edward VI., by whom he was knighted. In 1550 he married Amy, daughter and heiress of Sir John Robsart, the nuptials being solemnized in presence of the young king. In the first year of Mary he was imprisoned and condemned with his father for the attempt to transfer the succession to Lady Jane Grey; but the sentence of death was soon remitted, and he was afterward restored in blood. On the accession of Elizabeth he met with rapid preferment, his elegant and courtly address winning for him the chief place in the affections of the queen. He was made master of the horse, knight of the garter, and privy councillor, and was enabled to maintain the splendor of his station by grants of manors and castles. His intimacy with the queen was the occasion of scandal, and of a belief that he was encouraged to aspire to the hand of his sovereign. In 1560 his countess died, not without suspicion of violence, in the lonely mansion of Cumnor, in Berkshire, where she was living in retirement. In 1564 he was created baron of Denbigh and earl of Leicester, and other important offices were conferred upon him. Lady Douglas Howard, widow of Lord Sheffield, bore him a son, and claimed to have been privately married to him. In 1575 he was at the height of his power, and

entertained the queen for 17 days at his castle of Kenilworth in Warwickshire, on the decoration of which he is said by Dugdale to have expended £60,000, and the pageants and festivities were hardly surpassed in magnificence even in that splendid reign. In 1576 he secretly married the countess of Essex, immediately after she had become a widow. When this marriage was revealed to Elizabeth, she was with difficulty dissuaded from committing him to the tower. A virulent and skillfully written book against him, entitled "*Leicester's Commonwealth*," was published in 1584, and was many times reprinted under different titles. In 1585 he commanded the English forces in the Netherlands, and received from the United Provinces the office of captain general, and the whole control of their army and finances. This offended Elizabeth, and his ill success in the field disappointed the Hollanders. In 1586 he was called back to England to advise in the case of the queen of Scots, and recommended that she should be secretly despatched by poison; and in 1587 he returned to Holland, where his administration was so unpopular that he was soon recalled. In 1588, when the Spanish armada menaced the kingdom, he was nominated to the new office of lord lieutenant of England and Ireland; and he commanded the forces at Tilbury for the defence of the capital. He set out thence for his castle of Kenilworth, but was attacked with a violent malady, and died on the way. Notwithstanding his dissolute life, he maintained a show of respect for religion. He erected the hospital at Warwick, and gave its mastership to a Puritan divine. — **SIR ROBERT**, son of the preceding by Lady Sheffield, born in Sheen, Surrey, in 1573, died near Florence in 1639. He fitted out a maritime expedition at his own expense, with which he sailed to America in 1594, and captured some Spanish vessels. In 1596 he distinguished himself at the taking of Cadiz. On his return to England he attempted to establish his legitimacy and secure his paternal estates, but was defeated by his father's widow, the countess of Essex. He fled with the daughter of Sir Robert Southwell to Florence, and, assuming the title of earl of Warwick, was made chamberlain to the grand duchess of Tuscany and duke of the holy Roman empire. Meanwhile his estates in England were confiscated, and he was outlawed, but at the Tuscan court his honors increased. By draining a vast morass between Pisa and the sea he made Leghorn a large and beautiful town. He improved its harbor, caused the grand duke to declare it a free port, drew many English merchants to settle there, and having received a liberal pension, built a noble palace in the capital, and beautified his country seat of Carbello, three miles from Florence. He was the author of several works, the best known of which is *Dell' arcano del mare*, a remarkable collection of tracts relating to commerce and navigation (Florence, 1630, 1646; there is a copy in the

British museum dated 1661).—The castle of Dudley belonged to the family of Sutton till in 1697 it passed by marriage to that of Ward. John Ward (died in 1774) was created (1763) viscount of Dudley and Ward, and this viscounty continued till it became extinct at the death of John William Ward (1781–1833), who entered the house of commons in 1802, and became secretary of state under Canning.

DUDLEY, the name of several royal officers of Massachusetts. **I. Thomas**, governor of the province, born in Northampton, England, in 1576, died in Roxbury, Mass., July 31, 1652. In 1630 he came to Massachusetts with the commission of deputy governor, and he was governor from 1634 to 1640, and again from 1645 to 1650. He was a man of integrity and piety, though intolerant. **II. Joseph**, governor of the province, son of the preceding, born Sept. 23, 1647, died in Roxbury, April 2, 1720. He graduated at Harvard college in 1665, served in the Indian war in 1675, was sent to England as agent for the province in 1682, appointed president of New England in 1685, superseded by Andros a few months later, and made chief justice in 1687. He went to England again in 1689, was chief justice of New York from 1690 to 1693, then eight years lieutenant governor of the Isle of Wight, and finally governor of Massachusetts from 1702 to 1715. He was a man of high moral character, and a scholar. **III. Paul**, chief justice of the province, son of the preceding, born Sept. 3, 1675, died in Roxbury, Jan. 21, 1751. He graduated at Harvard college in 1690, studied law in London, and returned to Massachusetts in 1702 with the commission of attorney general. In 1718 he was appointed judge, and in 1745 became chief justice. He bequeathed £100 to Harvard college for the support of an annual lecture. This lecture is called from its founder the Dudleian lecture, and, according to the direction of the founder, is delivered on one of four subjects which are treated of in succession. The first of these is natural religion; the second, the Christian religion; the third, the errors of the Roman Catholic church; and the fourth, to explain and maintain the validity of the ordination of ministers according to the ancient custom in New England. He was a fellow of the royal society, and besides 12 treatises, chiefly on natural history, in the "Philosophical Transactions," published a work against the church of Rome.

DUDLEY, Benjamin Winslow, an American surgeon, born in Spottsylvania co., Va., in 1785, died at Lexington, Ky., Jan. 20, 1870. He received his education at Transylvania university, Lexington, Ky., and took his medical degree at the university of Pennsylvania in 1806. In 1810 he went to Europe and studied four years under the most eminent physicians. On his return he settled in Lexington, Ky. He operated for stone in the bladder 207 times and lost only five patients, and had occasion to repeat the operation in but one instance. He

also successfully applied a ligature to the carotid artery for aneurism within the skull, where trephining had been tried by another surgeon for supposed water on the brain. He retired from active practice in 1854. He published several medical essays, and on the organization of the medical school of Transylvania university became professor of surgery.

DUDLEY, Charles Edward, an American senator, born at Johnson Hall, Staffordshire, England, May 23, 1780, died in Albany, N. Y., Jan. 23, 1841. After the death of his father he came with his mother to Newport, R. I., in 1784. He entered into trade in that town, and made at least one voyage to the East Indies as supercargo. He subsequently removed to New York, where in July, 1809, he married Blandina, daughter of Rutgers Bleeker. Two years later he removed to Albany. He was elected state senator for three successive terms in 1820–25, mayor of the city in 1821 and 1828, and in 1829 United States senator to serve out the unexpired term of Martin Van Buren. He was particularly fond of astronomical science, and his widow contributed \$70,000 to the erection and endowment of the Dudley observatory. (See ALBANY.)

DUDWEILER, or **Duttweiler**, a town of Prussia, in the province of the Rhine, 10 m. N. E. of Saarbrück; pop. in 1871, 8,920. Near it are large coal mines.

DUEL, a premeditated combat between two persons, with deadly weapons, for the purpose of deciding some special difference. Single combats are of ancient date. Many are recorded in the Iliad; and the story of David and Goliath shows that duels were known to the Hebrews and other Asiatics, as they were also to the Arabs of the time of Mohammed. T. Manlius Torquatus fought with a gigantic Gaul in the war of 361 B. C. The barbarians who overran the Roman empire gave to single combats a new character, starting with the idea that the wager of battle is an appeal to the decision of God, and that success is a proof of right; hence the ordeal was accompanied with religious solemnities. Tacitus mentions it among the Germans, and it was formally legalized by Gundebald, king of the Burgundians, about 500. During the middle ages duels multiplied greatly, and as a judicial ordeal were approved by jurists and churchmen, and patronized by monarchs. The laws of the time show the excessive prevalent abuse of the ordeal. By the truce of God of 1041, duels were not permitted between Wednesday and Monday, the days intervening being sacred to Christ's passion. Louis IX. tried to restrain duels, and succeeded in reducing their number. Philip the Fair framed laws against them in 1296 and 1303, but in 1306 allowed them in criminal cases which could be reached in no other way. In 1315 Louis X. restored the judicial ordeal in civil cases. In 1386 Jacques Legris was accused of violence to a lady. He denied the crime, was forced to the

ordeal of battle, was overcome, and being adjudged guilty was hanged; but subsequently another person confessed that he was the criminal. This made a profound impression, and caused the abolition of the judicial ordeal. It was not formally abolished in some other countries for many years; but from this time it practically ceased.—The duel is no longer an appeal to the judgment of God, but is an attempt to secure satisfaction for an injury, especially for an insult. This idea owes its prevalence largely to Francis I., who laid down the principle "that the lie was never to be put up with without satisfaction, but by a base-born fellow;" and lies were divided into 32 classes, each having its own mode of satisfaction. Duelling at this time became a custom in France, whence it spread all over Europe, becoming especially popular in England and Ireland. In 1560 the states general prayed Charles IX. to punish duelling, and he issued an ordinance, which is the basis of the laws of Henry IV. and Louis XIV. This law, however, was ineffective. When Henry III. died, one of his courtiers, L'Isle Marivaux, swore not to survive him, and threw a challenge into the air; another lord picked it up, and sent him to join his master. Henry IV. fought not in person but by deputy, although he was constrained to legislate against duelling in 1602. But he practically nullified his law by granting thousands of pardons. Duelling in France reached its height under Louis XIII. Two gentlemen held each the other's left hand, and with the right stabbed each other with daggers. Two others in a close room cut each other's throat. In this reign several edicts were issued against duelling, and, thanks to Richelieu, were not a dead letter, as was seen in the beheading of François de Montmorency, count de Bouteville, in 1627. Louis XIV. opposed duelling, and lessened its frequency. Under the regency it revived, and Louis XV. could do little against it. Saint-Evremond and Saint-Foix, and especially the duke de Richelieu, were noted duellists. Under the next reign there were many duels, one of the most famous being that of the count d'Artois, afterward Charles X., with the duke de Bourbon-Condé. The first tendency of the revolution was to suppress duelling. It was looked upon as aristocratic, and the life of every man was said to belong to his country. When the reaction commenced duelling was revived, because of the ascendancy of the military class. Napoleon was averse to duelling, but had to tolerate it, even while expressing his contempt for duellists. The most celebrated duels in France since the revolution were between Gen. Gourgaud and Count Ségur, Col. Pepe and Lamar tine, Bugeaud and Dulong, Armand Carrel and Émile de Girardin (in which the former lost his life), Thiers and Bixio, and Proudhon and Félix Pyat. Since 1837 duellists and their seconds are liable to the criminal law in France

for any homicide resulting from the duel, but much discretionary power is left to the prosecuting magistrate. There have been female duels in France; a celebrated one was fought under the regency between Madame de Nesle and the countess de Polignac, for the possession of the duke de Richelieu. Duelling is still common in France, having raged in the latter part of the second empire chiefly among journalists.—In Spain the duel, though common, has been less frequent than in France. Charles V. issued an edict in 1519 for its suppression, but his conduct in his dispute with Francis I. nullified his edict. On March 12, 1870, Prince Enrique de Bourbon, brother of the king consort and infante of Spain, was killed in a duel with the duke de Montpensier.—Duels were favored by the northern races. In Denmark women were not allowed champions as in other countries, but were compelled to do their own fighting, though certain advantages were permitted them. In Norway this species of combat was held in high honor, but in Sweden it was nominally forbidden under severe penalties. Gustavus Adolphus was especially opposed to duelling, and once prepared a gallows for that party who should survive a particular combat; yet he offered the "satisfaction of a gentleman" to an officer whom he had struck. In Germany duelling is much less in vogue than in France, excepting among students in the universities. In Austria the ancient laws inflicting long imprisonment upon those who kill or maim their antagonists are still in force. Tribunals of honor for military men have existed in Prussia since 1843, for reconciling the contending parties when it can be done without prejudice to the military code of honor. If reconciliation is impossible, the duel takes place; if no injury is done, the imprisonment never exceeds six months; and if it prove fatal, never more than four years. Among the students of the German universities duels are fought with swords, and the combatants wear a complete defensive armor, consisting of thickly padded gauntlet and breastplate, the head and face only being exposed. These duels are rarely fatal, but often result in disfiguring cuts on the head and face. Russia has known little of the duel; but Russians have shown a readiness to fight in single combat quite equal to their steadiness in the battle field. The Poles have proved themselves staunch duellists, and the judicial combat was frequent in independent Poland. The Netherlands have closely imitated France, both in duelling and in attempts to suppress it.—It has been asserted that single combats were introduced into England by the Normans. They are said to have instituted the wager of battle, from which duelling proceeded, and which it is believed was unknown to the Saxons. Yet Lappenberg asserts that "William the Conqueror speaks of the judicial combat as a known English custom." It was not formally abolished until the last year of the reign of George III.; and as late as 1774 it

was defended by some of the greatest men of England. In the reign of James I. there were many duels, one of the most noted of which was between Lord Bruce and Sackville, afterward earl of Dorset, in which the former was killed. A sermon delivered by Chillingworth before Charles I. contains a warm expostulation against duelling. Cromwell was a foe to the practice. After the restoration it became more common, from the spread of French ideas. Some of the English duels of that time were in keeping with its loose morality. The duke of Buckingham killed Lord Shrewsbury; Lady Shrewsbury, on whose account the duel was fought, attending the duke as a page, and then passing the night with her lover. In Anne's reign, the duel between the duke of Hamilton and Lord Mohun, in which both fell, caused much feeling, from its political character, and the atrocities that marked it. Duels became more numerous as society became more orderly, and many of the most distinguished Englishmen took part in them. William Pulteney, leader of the opposition, fought Lord Hervey. Wilkes was engaged in two duels. Throughout the reign of George III. duels were frequent; among those who fought in England were Charles James Fox, Sheridan, Pitt, Canning, Castlereagh, the duke of York, the duke of Richmond, Sir F. Burdett, and Lord Camelford; the last named was the great duellist of the time, and fell in a duel in 1804. During the reigns of George IV., William IV., and Victoria, there were some noted duels, among which was that between the duke of Wellington and Lord Winchelsea, in 1829, the duke challenging the earl because of the latter's reflections on his conduct at the time he determined upon emancipating the Roman Catholics. The duke fired at his antagonist, who fired in the air, and then apologized. In 1835 Benjamin Disraeli challenged Morgan O'Connell. Among the most conspicuous duels in England of late years was that between the earl of Cardigan and Capt. Tuckett in 1840.—Ireland is that part of the British empire in which duelling has always been most in vogue. In the latter part of the last century there was scarcely an Irishman of note who had not been "out," and many of them had fought often. Grattan, Curran, Lord Clare, Flood, Burrowes, Barrington, Toler, and many others, men of high positions, were among the Irish duellists of those times. In 1815 Daniel O'Connell fought with and killed Mr. D'Este, a member of the Dublin corporation, which the former had stigmatized as a "beggary" body. In Scotland duels have not been so common as in Ireland. In 1822 James Stuart, known by his work on the United States, killed Sir Alexander Boswell in a duel, which grew out of gross newspaper attacks on the former. Stuart was tried and acquitted. Francis Jeffrey, who was of counsel for the defence, went almost the entire length of upholding duelling, and boldly assumed that

the man who slew another under the circumstances that caused Stuart to slay Boswell was not guilty of murder in any sense. The court, while it charged that killing in a duel was murder, declared that there was no evidence of malice on the part of Stuart, and praised his conduct on the ground; and when the acquittal was given, the court congratulated him on the result. It is a singular fact that Boswell, when a member of parliament, took the principal part in getting two old Scotch statutes against duelling repealed, one of which made the mere fighting of a duel, though it should have no evil result, punishable with death.—The first duel in America took place in 1621, at Plymouth, between two serving men. They were sentenced to be tied neck and heels together for 24 hours, but a portion of the punishment was remitted. In 1728 a young man named Woodbridge was killed in a duel on Boston common, by another young man named Phillips. They fought without seconds, in the night and with swords. Phillips got on board a man-of-war and escaped to France. A great sensation was caused, and a new and severe law against duelling was enacted. There were some duels in the revolution, the most noted being those between Charles Lee and John Laurens, in which the former was wounded, and between Cadwalader and Conway, in 1778, in which the latter received a shot in the head from which he recovered. Button Gwinnett, one of the signers of the Declaration of Independence, was killed in a duel with Gen. McIntosh, in May, 1777. In 1785 Capt. Gunn challenged Gen. Greene twice, and threatened a personal assault when the latter refused to meet him. Greene wrote to Washington, acknowledging that if he thought his honor would suffer from his refusal he would accept the challenge. Washington approved of his course. Alexander Hamilton was killed in a duel with Aaron Burr in 1804, the latter being vice president and the former the leader of the opposition. This duel is allowed the first place in the history of American private combats. Next stands that between Capts. Barron and Decatur, the latter being killed and Barron severely wounded. Henry Clay and John Randolph fought in 1826. Andrew Jackson killed Charles Dickinson in a duel, and was engaged in other "affairs." Thomas H. Benton killed a Mr. Lucas, and had other duels. In 1841 Henry Clay was on the eve of fighting with William R. King, then a senator from Alabama. Mr. Cilley of Maine fought with Mr. Graves of Kentucky in 1838, near Washington, and the former was killed. This duel caused nearly as much excitement as that between Hamilton and Burr. Both parties were members of congress. Formerly duels were very common in the United States navy, and valuable lives were lost. Richard Somers, who is said to have been a mild man, fought three duels in one day. In 1830 President Jackson caused the names of four officers to be struck

from the navy roll because they had been engaged in a duel. In the northern states public opinion has always been against duelling; yet at the beginning of the century duelling was common there, and several duels were fought in New England, while the "code of honor" was in full force in New York and New Jersey. Five shots were exchanged between De Witt Clinton and John Swartwout in 1802; and a challenge passed between Mr. Clinton and Gen. Dayton of New Jersey in 1803. Duels have been not infrequent in the different parts of British America.—By the common law, when one of the parties to a duel is killed, the survivor and the seconds are guilty of murder; and the participation in a duel, either as principal or second, where there is no fatal result, is regarded as a misdemeanor. Many of the states have modified this rule; in some the killing of a man is punishable with death, in others a term of imprisonment with forfeiture of political rights is substituted. Some states require certain officers of state to make oath either that they have not within a certain time been, or will not be, concerned in a duel; and in nearly all the duellist and his abettors are disqualified from holding office or exercising the elective franchise for life, or for a term of years, according to the issue of the duel. In the American naval and military service, an officer implicated in a duel with another, either as principal or second, is liable to be cashiered; and an equally stringent provision exists in the British service.—See J. G. Millingen, "The History of Duelling" (2 vols., London, 1841); Lorenzo Sabine, "Notes on Duels and Duelling, with a preliminary Historical Essay" (12mo, Boston, 1855).

DUER, John, an American jurist, born in Albany, N. Y., Oct. 7, 1782, died on Staten island, Aug. 8, 1858. He was the son of Col. William Duér of the revolutionary army, and on his mother's side a grandson of Gen. William Alexander, the claimant of the Scottish earldom of Stirling. In his 16th year he entered the army, but after two years left the service for the study of law. He commenced practice in Orange co., N. Y., whence about 1820 he removed to the city of New York, where he resided until his death. In 1825 he was appointed one of the commissioners to revise the statute law of the state, and afforded valuable assistance in the preparation of the first half of the work. In 1849 he was elected a justice of the superior court of New York city, and in 1857 he became the presiding justice of the court. In 1845 he published a "Lecture on the Law of Representations in Marine Insurance," and in 1845-'6 a treatise on the "Law and Practice of Marine Insurance" (2 vols. 8vo), which has become a standard authority in the United States. In 1848 he delivered a discourse on the life of Chancellor Kent, and at the time of his death was editing "Duér's Reports" on the decisions of the superior court. The 6th volume, which he

did not live to complete, he revised while confined to his bed by a fracture of the thigh.

DUFAURE, Jules Armand Stanislas, a French statesman, born at Saujon, Dec. 4, 1798. He studied at Paris, practised law at Bourges, was elected deputy for Saintes in 1834, and was continually reelected till 1848, acting with the liberal constitutional party, and exercising great influence, especially in regard to public works and finances. He was nominated councillor of state by Thiers in 1836, and became minister of public works in 1839 under Soult, but vacated his office in the following year on the return of Thiers to power. In 1844 he was elected vice president of the chamber, and after the revolution of February, 1848, a member of the committee on the constitution, and minister of the interior under Gen. Cavaignac. Under the presidency of Louis Napoleon he held the same office for a short time in 1849, and after the *coup d'état* he retired to private life. In 1871 Thiers appointed him minister of justice, and a special decree conferred on him the vice presidency of the council of ministers, which offices he lost on the accession of MacMahon in 1873.

DU FAY, Charles François de Cisternay, a French savant, born in Paris, Sept. 14, 1698, died July 16, 1739. He made new researches concerning phosphorus, the barometer, the refracting power of crystals, the magnet, and electricity. He introduced the theory of two kinds of electricity, the vitreous and the resinous. He spent ten years in rearranging and improving the *jardin des plantes*, and made it the first establishment of the kind in Europe.

DUFF, Alexander, a Scottish missionary, born in Perthshire in 1806, died in February, 1878. He entered the university of St. Andrews at the age of 15, and while there became intimate with Dr. Chalmers. In the summer of 1829 he was licensed to preach. During the later years of his academical studies he was the associate of John Adams and John Urquhart, afterward known in connection with missions. These young students spent much of their leisure time in visiting the poor, distributing tracts, and conducting prayer meetings and Sunday schools in destitute parts of the surrounding country. The churches in Scotland had not yet undertaken any mission to the heathen. When a mission to India was resolved upon, Mr. Duff was selected as the first missionary, and he set sail toward the close of 1829. During his voyage he was shipwrecked on a reef while rounding the cape of Good Hope, and again on the coast of Ceylon. By the first of these mishaps he and his wife lost everything that belonged to them; his plans of operation, his library, and papers were all lost. In India he was kindly received, but not encouraged by his countrymen. Rammo-hun Roy, however, who had considerable influence over the natives, entered warmly into the views of Duff, and with his assistance a school was commenced under a banian tree

with five young men. The shade of the banian was soon too narrow. The studies of the school were accompanied with the daily reading and exposition of the Scriptures. The value of Mr. Duff's labors was very soon apparent both to the native population and their British rulers. His honesty, perseverance, and zeal, in connection with his varied gifts and talents, soon gave a commanding influence to him and the Scottish college which he had established, which ultimately became the largest institution of its kind in India. When intelligence of the disruption of the church of Scotland in 1843 reached Calcutta, Dr. Duff and his brethren at once and unanimously declared their adherence to the Free church, and vacated their institution, with all its valuable library and apparatus. Dr. Duff returned to Europe in 1851 to recruit his health; but he entered on the revival of the missionary spirit among the British people, visiting the churches even in the remotest British isles. In 1854 he made a voyage to America, visited the principal cities in the northern and western states, and passed through Canada. In 1855 he returned to India, but finally left it in 1863 on account of ill health, and was made professor of evangelistic theology by the general assembly. An endowment of £10,000 had been raised for this professorship, but he refused to accept any salary, stipulating that the income should be given to the cause of missions. He published "New Era for the English Language and Literature in India" (Edinburgh, 1837), "India and India Missions" (1839), and "Letters on the Indian Rebellion" (1858).

DUFFERIN, Frederick Temple Hamilton Blackwood, earl of, an English statesman and author, son of the fourth Baron Dufferin and Helen Selina, granddaughter of Richard Brinsley Sheridan, born June 21, 1826. He was educated at Eton, and at Christchurch, Oxford. He succeeded his father July 21, 1841, as fifth Baron Dufferin and Clandeboye, and was made baron of the United Kingdom in 1850. In 1860 he was sent by Lord Palmerston as British commissioner to Syria, to inquire into the massacre of Christians there. In October, 1862, he married Harriet Georgina Hamilton, who is distinguished as the author of "The Hon. Impulsia Gushington," a lively satire illustrated from her own drawings, describing the tour of a fashionable lady in Egypt. He was under secretary of state for India 1864-'6, and for war 1866-'7; was made chancellor of the duchy of Lancaster in 1868; was created Viscount Clandeboye and earl of Dufferin in November, 1871; and was appointed governor general of the Dominion of Canada June 1, 1872. He is the author of "Letters from High Latitudes," a narrative of a yacht voyage to Iceland in 1859 (London, 1860), a new and enlarged edition of which was published at Montreal in 1873.

DUFFY, Sir Charles Cavan, an Irish politician, born in Ulster in 1816. He is the son of a

farmer, became a journalist at the age of 18, and for several years edited a newspaper at Belfast. While thus engaged he studied law and was called to the bar, but never practised. In 1842 he established the "Nation" in Dublin, a publication strongly in the interest of O'Connell and the advocates of repeal of the union; and in 1844 he was imprisoned with O'Connell and the prominent repealers. In 1848 he was tried with Smith O'Brien, Thomas Francis Meagher, and others, for sedition, but was acquitted. He then revived the "Nation," which had been suspended, and advocated various social reforms for Ireland, and between 1852 and 1856 represented New Ross in parliament. In the latter year he emigrated to Australia, where he has been a member of the colonial legislature, and of the ministry. In 1871 he became prime minister of the colony, and in 1873 was knighted. He is the author of "Ballad Poetry of Ireland."

DUFOUT, Guillaume Henri, a Swiss general, born in Constance, Sept. 15, 1787, died July 14, 1875. He was educated in Geneva and Paris, entered the French army in 1809, served in the last campaigns of Napoleon, and distinguished himself during the hundred days. When Geneva was restored to Switzerland, he became a citizen of the republic, and in 1831 was made chief of the staff of a corps destined to defend its neutrality. He was intrusted with the management of the military school at Thun, and with the survey of Switzerland. When the organization of the Sonderbund, and the apprehended intervention of foreign powers, seemed to threaten the existence of the confederation in 1847, he was chosen commander-in-chief of the federal forces, and rapidly suppressed the civil war. In 1864 he was president of an international council in regard to the treatment of the wounded, which resulted in the convention of Aug. 22 between 12 European states. He wrote *De la fortification permanente* (1824), *Géométrie perspective*, &c. (1827), *Mémoires sur l'artillerie des anciens et sur celle du moyen âge* (1840), and *Manuel de tactique* (1842).

DUFOUT, Léon, a French naturalist, born about 1782, died at St. Sever, Landes, in April, 1865. He studied medicine at Montpellier, and after taking part in the Spanish campaign of 1823 as army physician, he settled in St. Sever. Besides numerous articles scattered in periodical publications, he wrote *Relation de voyage dans les montagnes maudites* (1821); *Recherches anatomiques et physiologiques sur les hémiptères* (4to, 1833); *Essai sur quelques points de l'état actuel de la physique et de la chimie* (1853); *Propriétés des végétaux et leurs applications à l'alimentation, la médecine, la teinture*, &c. (1861).

DUFRENOY, Pierre Armand, a French geologist and mineralogist, born at Sevrans, Seine-et-Oise, in 1792, died in Paris, March 20, 1857. His mother Adelaide (1765-1825) was a poetess of merit. His first essay appeared in

1819, and was followed by a great variety of papers on mineralogy and geology, which gained him a high reputation. His explorations in southern France and in the Pyrenees led him to develop the theory of metamorphism. He explored the vicinity of Naples, and in his essay entitled *Des terrains volcaniques des environs de Naples* he maintains that Herculaneum and Pompeii were destroyed by a landslide from Vesuvius. With Élie de Beaumont he explored between 1823 and 1836 various parts of France, England, and northern Spain, the principal result of which was the great geological map of France, with 3 vols. of text, published in 1841. Another product of their common labors was the *Voyage métallurgique en Angleterre* (2 vols. 8vo, 1827; enlarged ed., 1837-'9). (See ÉLIE DE BEAUMONT.) He was one of the most active members of the academy of miners, director of the school of mines, and professor of mineralogy and geology. He introduced a new classification of minerals based upon crystallography, promoted in various other ways the study of mineralogy and meteorology, and published a *Traité de minéralogie* (2d ed., enlarged, 4 vols. 8vo and 1 vol. of plates, Paris, 1856-'9).

DU FRESNE, Charles. See DU CANGE.

DUFRESNOY, Charles Alphonse, a French painter and poet, born in Paris in 1611, died at Villiers-le-Bel, near Paris, in 1665. His pictures are correct, but not otherwise remarkable, and he is now chiefly remembered as the author of a Latin poem entitled *De Arte Graphica*, which has been translated into French by Roger de Piles, and by several since him, and three times into English, viz.: into prose by Dryden (4to, London, 1695) and by Wills (4to, 1754), and into verse by William Mason, with notes by Sir Joshua Reynolds (4to, York, 1783).

DUFRESNY, Charles Rivière, a French dramatist, born in Paris in 1648, died there, Oct. 6, 1724. He was descended from Henry IV. by one of the mistresses of that monarch, known as *la belle jardinière*. He enjoyed the favor of Louis XIV., wrote some excellent comedies, and had great skill as a landscape gardener. Among his most successful comedies are *L'esprit de contradiction*, *La coquette de village*, and *Le faux sincère*. His *Poésies diverses* are also praised. A selection of his works was published at Paris in 2 vols. in 1810.

DUGDALE, Sir William, an English antiquary, born in Shustoke, Warwickshire, Sept. 12, 1605, died there, Feb. 10, 1686. He was educated partly in the free school of Coventry, partly by his father, was made pursuivant at arms extraordinary under the title of Blanch Lyon in 1638, became garter principal king at arms in 1677, and was knighted. In 1641 exact drafts of all the monuments in Westminster abbey and in many of the churches of England, with copies of their inscriptions, were made under his superintendence and deposited in Sir Christopher Hatton's library. With Roger Dods-

worth he projected the publication of the charters and descriptions of all the monasteries of the kingdom; and he collected from the Bodleian and other Oxford libraries, from the tower records, the Cottonian library, and the papers of André Duchesne, materials for the work, the first volume of which, in Latin, was published in London in 1655, under the title of *Monasticon Anglicanum*; vols. ii. and iii. were issued in 1661 and 1673; a new enlarged and illustrated edition, in 6 vols. crown folio, was published in 1817-'30. This edition was reprinted at London in 8 vols. fol. in 1846. Several abridgments of the work have been made in English. Among Dugdale's other contributions to history are the "Antiquities of Warwickshire" (fol., 1656), one of the best works of the kind ever published; "History of St. Paul's Cathedral" (fol., 1658); "History of Imbanking and Draying of divers Fens and Marshes" (fol., 1662); "*Origines Juridicales*, or Historical Memoirs of the English Laws, Courts of Justice, Forms of Trial, Punishment in Cases Criminal, Law Writers," &c. (1666); "The Baronage of England, or an Historical Account of the Lives and most memorable Actions of our English Nobility" (3 vols. fol., 1675-'6); "A Short View of the late Troubles in England" (Oxford, 1681); "Ancient Usage in bearing of such Ensigns of Honor as are commonly called Arms" (Oxford, 1681); "A Perfect Copy of all Summons of the Nobility to the Great Councils and Parliaments of this Realme, from the XLIX. of Henry the III. until these present Times" (London, 1685). Dugdale also completed the 2d volume of Sir Henry Spelman's *Concilia*. His "Life, Diary, and Correspondence," with an index to his MS. collections, many of which are preserved in the Ashmolean museum at Oxford, was published at London in 1827 by William Hamper.

DUGONG, a herbivorous cetacean, of the genus *dugungus* (Lacépède) or *halicore* (Illiger), the only genus of its family, and the only undisputed species of the genus; the Malay name is *duyong*, and the scientific *halicore Indicus* (Desm.) or *H. dugung* (F. Cuvier). The general shape is fish-like; the head is small in proportion to the body, and separated from it by a slight cervical depression; there is no dorsal fin, and the horizontal tail is crescent-shaped; there are no posterior limbs, but the anterior are like cetacean paddles without any trace of nails or division into fingers. The upper lip is very large, thick, obliquely truncated, forming a blunt snout such as would be made by cutting off an elephant's trunk near the mouth; the anterior portion is covered with soft papillæ, with a few stiff bristles; the lips have a corneous edging which assists in tearing sea weeds from the bottom. In the old animal the incisors are two above and none below, large, but nearly covered by the tumid and movable lip; in the young, the upper permanent incisors are preceded by two deciduous ones, and there are six or eight lower incisors

which fall and are not succeeded by permanent ones. The molars in the adult are $\frac{3}{2}-\frac{2}{2}$, simple and elliptical, in the young $\frac{6}{2}-\frac{6}{2}$, far back on the horizontal portion of the jaw; the grinding surface presents an outer rim of enamel, with the central ivory portion slightly depressed; they have no proper roots, and grow as long as they can be of use to the animal. The skin is thick and smooth, with a few scattered bristles; the color is bluish above and white beneath; the mammae are two, and pectoral; the fins are used not only for swimming, but for crawling along the bottom. The cranial bones are dense and large, with loose connections where any sutures exist. The intermaxillaries are very large, extending back as far as the middle of the temporal fossae, and bent down at a right angle over the symphysis of the lower jaw, terminating nearly on a level with its lower margin; this is necessary for the accommodation of the incisors, one of which is in each intermaxillary; for this reason also the nostrils are displaced upward, dif-

Dugong.

ferent from the allied manatee, so that their opening is turned up as in the typical cetacea; indeed, this animal comes nearer than its congener to the whales in its forked tail, absence of nails, and superior opening of the nostrils. The whole skull (and especially the frontal bones) is comparatively short; the parietal crests are widely separated; there is no bony tentorium, no sella turcica, very few and small openings in the cribriform plate of the ethmoid bone, and the optic foramina are converted into a long and narrow canal. The lower jaw corresponds to the angle of the intermaxillaries, and is bent downward at the symphysis; on its anterior surface are three or four rough and shallow alveoli, sometimes containing rudimentary incisors. The cervical vertebrae are 7, separate; the dorsals 18, with spinous processes bent back and elongated from the first to the last, and of the same length as the transverse; the lumbar 3, with long spinous and transverse processes; one sacral, to which rudimentary pelvic bones are suspended; cau-

dals about 24, with chevron bones for the anterior three fourths, and becoming flattened posteriorly. The ribs are 18, less thick and dense than those of the manatee, the first 3 attached by cartilages to the sternum; the shoulder blade is large, with the anterior angle rounded, the posterior extended backward with a concave margin; the spine is prominent, and the acromion and coracoid processes are pointed; the humerus is short, thick, with a prominent deltoid ridge; the radius and ulna are very short, rounded, ankylosed at each end; the carpal bones are 4, in two rows; the thumb is rudimentary, its metacarpal bone small and pointed; the other metacarpals are flattened, with three-jointed phalanges. The tongue is thick, the anterior upper surface with cuticular spines, and on each side at the base a horny, retroverted, pointed process. The stomach is divided into two portions, the cardiac large and globular, the pyloric narrower; at the constriction between the two are two tubular caecal prolongations as in some pachyderms, and at the cardiac end is a rounded glandular mass as in some rodents; the intestines are 14 times as long as the body, and the caecum is simple and heart-shaped. The liver is transversely oblong, with one large and three small lobes; the gall bladder is present, elongated, receiving bile directly from the hepatic ducts; the spleen is very small and rounded. The heart has its ventricles deeply cleft, but not affecting the circulation; the capacity of the pulmonary artery is very great, to accommodate the delay of the blood in the lungs during submersion. The lungs are very long, flattened, one fourth as long as the body; the superficial air cells are large, the dorsal extent is great, the trachea divides high up, and the bronchi are long, as in marine turtles; the cartilages of the bronchial tubes are continued spirally into each other. The sense of smell must be dull; the eye is very small and convex, with a nictitating membrane beside the lids; the external orifice of the ear is hardly perceptible; the nasal openings are two parabolic slits, whose semilunar edge acts as a valve; the interior of the cheeks, according to F. Cuvier, is entirely covered with strong hairs. The usual length of the dugong is from 8 to 10 ft., though it has been seen as long as 20 ft.; it is found in the seas of the East Indies, especially in the Malayan archipelago, never on land, rarely if ever in fresh water, but generally in troops where the depth is not more than three fathoms. Its food consists of fuci and algæ, and it browses on the marine vegetation as a cow does on land. It yields little or no oil, but is hunted by the Malays for its flesh, which resembles young beef, and is tender and palatable. It is generally speared, and at night, especially during the northern monsoon, at the mouths of rivers, when the sea is calm. The affection of the mother for her young is very remarkable. In the Red sea is a species called *H. tabernaclorum* by Rüppell, from his be-

rief that the Hebrews covered with its skin their tabernacle and sacred ark; this is generally considered a mere variety. An allied fossil genus, *halitherium* (Kaup), is found in the tertiary calcareous deposits of Europe. (See MANATEE.)

DUGUAY-TROUIN, René, a French admiral, born in St. Malo, June 10, 1673, died in Paris, Sept. 27, 1736. He distinguished himself as commander of a privateer in the war against England and Holland, and Louis XIV. presented him with a sword, and in 1697 gave him the command of a vessel in the navy. In the war of the Spanish succession he captured more than 300 merchant ships and 20 ships of war. But the exploit which won him the most renown was the capture of Rio de Janeiro in 1711, which brought an immense sum of money to the French government. He was as generous and modest as he was brave.

DU GUESCLIN, Bertrand, constable of France, born near Rennes, Brittany, about 1314, died near Châteauneuf de Randon, Languedoc, July 13, 1380. He belonged to an ancient family, and though dull at his studies excelled in all sports and manly exercises. In the tournament given at Rennes in 1338 in honor of the marriage of Charles de Blois with Jeanne de Penthievre, he unseated the best knights of Brittany, and bore away the great prize. In the war between the rival claimants of the dukedom of Brittany, the count of Blois and Jean de Montfort, he joined the former, and put himself at the head of a band of adventurers. After the defeat and capture of Charles he was one of the Breton noblemen who went to England to treat for his release. After the battle of Poitiers in 1356, Rennes being besieged by the duke of Lancaster, Du Guesclin forced his way into the place with a few followers, and defended it till the siege was raised in June, 1357. Charles de Blois gave him in recompense the lordship of La Roche d'Airien. Charles V. sent him with a body of troops against the combined forces of England and Navarre, over which he gained a great victory at Cocherel, on the banks of the Eure, in May, 1364. For this he was made count of Longueville and marshal of Normandy. In the latter part of this year, however, he was defeated and taken prisoner by Sir John Chandos at Auray in Brittany. Peace being concluded with England, Du Guesclin's companies began to plunder the richest provinces of France; and to rid the kingdom of them Charles procured the release of their leader at a ransom of 100,000 crowns. Du Guesclin persuaded them to follow him in a crusade against the Moors of Spain, although his real object was to aid Henry of Trastamare in his struggle with his brother Pedro the Cruel for the throne of Castile. On their way southward they levied 100,000 francs upon the pope at Avignon, besides exacting from him absolution and his blessing. They found little difficulty in establishing Henry upon the throne, but Don

Pedro having secured the alliance of England, they were defeated by the Black Prince, and Du Guesclin was captured (1367). The conqueror, hearing it rumored that he feared to release his captive, offered to ransom him for 100 francs or less if he chose. Du Guesclin declared that he was worth 100,000 gold florins, and that if the kings of France and Castile would not ransom him there was not a woman in the kingdom who would not contribute to the sum. On his release he again joined Henry, whom he firmly placed on the throne, after defeating Don Pedro. He was created constable of France in 1370, and for several years was employed in the west and south against the English, regaining many places long occupied by them. The duke of Brittany, fancying himself threatened by Charles, sought the alliance of England, whereupon Charles invaded the province and declared its annexation to France. In consequence of this Du Guesclin resigned his office, and departed for the court of Castile. He paused before Randon, which was besieged by a French army under Marshal Sancerre, and there sickened and died the day before the capitulation. The commander of the garrison, marching out at the head of his troops, placed the keys of the fortress upon the dead body of the hero, who was finally buried in the chapel of St. Denis, by the side of the kings of France. Biographies of Du Guesclin are numerous. Among the more recent are those of Bouillé, *Histoire de Bertrand du Guesclin* (Paris, 1837; Tours, 1843), Fallet (Rouen, 1856-'63), Bérard (Dinan, 1862), and Jamison (London, 1864).

DU HALDE, Jean Baptiste, a French geographer, born in Paris, Feb. 1, 1674, died Aug. 18, 1743. In 1708 he became a Jesuit, and was afterward appointed to edit the letters of missionaries in various parts of the world, and especially in China. The result was two works which contributed largely to geographical knowledge: *Lettres édifiantes et curieuses écrites des missions étrangères*, edited by Du Halde from the 9th to the 26th volume inclusive; and *Description géographique, historique, chronologique, politique et physique de l'empire de la Chine et de la Tartarie chinoise* (4 vols. fol., Paris, 1735). An English translation of the latter was published in London (4 vols. 8vo, 1736, 1744; 2 vols. fol., 1742). The *Lettres édifiantes* have been translated into German, and a selection from the earlier volumes appeared in London in 1743, in 2 vols. 8vo, entitled "Jesuits' Letters."

DUHAMEL, Jean Marie Constant, a French mathematician, born in St. Malo in 1797, died in Paris in May, 1872. He was a graduate of the polytechnic school, and a teacher there for nearly 50 years. In 1840 he became a member of the academy of sciences, and in 1851 titular professor of the faculty of sciences. He was one of the best mathematicians of the century. His principal works are *Cours de mécanique de l'école polytechnique* (2 vols.,

1845-'6), and *Des méthodes dans les sciences de raisonnement* (1866 et seq.).

DUIDA, a remarkable and nearly isolated mountain in the state of Guayana, Venezuela, about 20 m. N. E. of the junction of the Casiquiare and the Orinoco; lat. 3° 10' N., lon. 66° 12' W. Although it is only about 8,000 ft. in height, it is so nearly perpendicular that its summit has never yet been reached by man. Its S. and W. sides are bare and stony to the top; the others, which are less steep, are covered with dense forests. At the beginning and end of the rainy season small shifting flames are seen to play about the highest peaks, inducing the belief that the mountain is a volcano; but they are probably due to gaseous exhalations. Its rock crystals and quartzes were once taken for diamonds and emeralds, to which error the mission of Esmeralda, a few miles from its base, owes its name. The mountain serves as a landmark to the traveller on the Orinoco for a great distance.

DULIUS, Caius Nepos, consul of Rome in 260 B. C., noted for his naval victory over the Carthaginians, the first success ever obtained by the Romans on the sea. The battle was fought off Mylæ in Sicily, and the triumph of Duilius is attributed to his invention of grappling irons, which enabled his men to fight the enemy hand to hand. On his return to Rome he was honored with a magnificent triumph, and a column was raised to commemorate the event.

DUISBURG, a town of Prussia, in the province of the Rhine, 15 m. N. by E. of Düsseldorf, near the confluence of the Ruhr with the Rhine, on the railway from Cologne to Minden; pop. in 1871, 30,520. It is surrounded with dilapidated walls, has a gymnasium, a female high school, a library, a botanic garden, and manufacturing of woollens, cotton, velvet, leather, tobacco, and porcelain. In the vicinity are extensive sugar refineries and iron forges.

DUJARDIN, Félix, a French naturalist, born in Tours, April 5, 1801, died April 8, 1860. He was the son of a poor watchmaker, and was dependent on his own exertions for his education. From 1827 to 1834 he had charge of the public course of lectures in Tours on geometry and chemistry as applied to the arts. In the latter year he went to Paris to prepare a geological description of Touraine, but was persuaded by Dutrochet to turn his attention to zoölogy. He devoted himself chiefly to investigations among the infusoria, and arrived at conclusions which led him to oppose the theories of Ehrenberg and to make a new classification. In 1839 he was appointed professor of mineralogy at Toulouse, and afterward of botany and zoölogy at Rennes. His principal works are: *Observations sur les rhizopodes* (1835); *Promenades d'un naturaliste* (1837); *Histoire naturelle des zoophytes infusoires* (1841); *Manuel complet de l'observateur au microscope* (1842); and *Histoire naturelle des helminthes* (1844). He left unfinished a work

entitled *Histoire naturelle des zoophytes échinodermes*, which was edited and published by M. Hupé in 1861. He founded in 1839 a scientific journal entitled *Hermès*.

DUJARDIN, Karel, a Dutch painter, born in Amsterdam about 1640, died in Venice, Nov. 20, 1678. He was a pupil of Berghem; studied in Italy, where his pictures were very popular; went to Lyons, got into debt, and married his landlady, whom he soon deserted, and returned to Amsterdam. To escape from his wife he again went to Italy. On his death the Venetian senate paid him unusual honors. In spite of dissipation, he left a great number of paintings, principally of pastoral scenes and animals.

DUKE (Lat. *dux*, a leader; Fr. *duc*), a title belonging originally to the commanders of armies. In the later periods of the Roman empire it designated the military governor of a district, and until the time of Theodosius the rank of dukes was esteemed inferior to that of counts. Subsequently their dignity greatly increased, several provinces often became subject to a single duke, and the title was not disdained by conquerors such as Alaric and Attila. The northern barbarians who invaded the territories of declining Rome adopted, if they had not before borrowed, the titles of duke and count; but among these martial tribes the dukes, as military chieftains, acquired a decided preëminence over the counts, who both in the Byzantine and western empires had been employed chiefly in civil offices. Under the successors of Charlemagne, the governors of provinces generally assumed the title of duke, and achieved an almost absolute independence. The kings of France finally reunited to the crown the dukedoms which had been severed from it; and the ducal sovereignty being extinguished, the name has remained in France only as a hereditary title of dignity. Prior to the revolution dukes were created by letters patent of the king, and were of three kinds, of which those designated as dukes and peers held the first rank, and had a seat in parliament, and certain honors and prerogatives at court. The dignity of the second class or hereditary dukes was transmissible to their male children, but that of the dukes by brevet ceased with themselves. The ducal and all other titles of nobility, abolished at the commencement of the revolution, were reëstablished in 1806. The rank of duke in the royal family of France was superior to that of prince, inferior sometimes to that of count, and always to that of dauphin. In other great families also the title was higher than that of prince. In Germany, where the idea of sovereignty is inseparable from the ducal dignity, this title (Ger. *Herzog*) comes immediately after that of royalty. Under the emperor Henry IV. dukes began to usurp those sovereign rights which they have since exercised, and six dukedoms were then established. Several of the primitive dukes have exchanged their title for that of grand duke. The princes of the house of

Austria bear the title of archduke. The title of duke, or properly prince (Russ. *Kniazh*), was originally borne by the czars of Russia, and that of grand duke or grand prince still distinguishes the princes of that house. The kings of Poland were grand dukes or grand princes of Lithuania. Italy until recently had several sovereign dukes, as the grand duke of Tuscany, and the dukes of Modena and Parma. The title exists also in the Netherlands, and in Portugal and Spain.—In England the dukedom is the highest dignity in the peerage. It was introduced by Edward III., who in 1337 created his eldest son, Edward the Black Prince, then earl of Chester, duke of Cornwall, and subsequently prince of Wales, when the dukedom merged in the principality, and has ever since been vested in the heir apparent to the crown. The second dukedom was conferred, March 6, 1351, upon Henry Plantagenet, son and heir of the earl of Derby, under the title of duke of Lancaster, which dignity expired at his decease without male issue, but was reconferred in 1362 upon John of Gaunt, who had espoused the duke's second daughter, and eventually sole heiress, the Lady Blanche Plantagenet. In the reign of Elizabeth, in 1572, the whole order became extinct; but it was revived about 50 years afterward by her successor in the person of George Villiers, duke of Buckingham. A duke is styled "his grace" and the "most noble," and is officially addressed by the crown as "our right trusty and right entirely beloved cousin and councillor." The present prince of Wales, besides being duke of Cornwall, is duke of Rothesay; his brother Prince Alfred is duke of Edinburgh; the grandson of King George III. is duke of Cambridge; and besides those of the royal family there are in Great Britain 21 English, 8 Scottish, and 2 Irish dukes.

DUKES COUNTY, a county of Massachusetts, consisting of a number of islands in the Atlantic ocean, with an aggregate area of 118 sq. m.; pop. in 1870, 3,787. Martha's Vineyard, the largest island, lies about 5 m. S. of Barnstable co., from which it is separated by Vineyard sound. The others are Chappaquidick island and No Man's Land, and the Elizabeth group. In 1872 there were 4 vessels, of 1,297 tons, engaged in the whale fishery, and 39 vessels entered and cleared in the coastwise and carrying trade. The county constitutes a customs district, of which the port of entry is Edgartown. For the year ending June 30, 1872, there were registered, enrolled, and licensed 20 vessels, with an aggregate tonnage of 2,611. Many of the inhabitants are engaged in foreign commerce. A great part of the surface is occupied by low forests, but there are cultivated tracts yielding good crops of potatoes, hay, and grain. The total value of agricultural products in 1870 was \$56,280; of live stock, \$63,555. Capital, Edgartown.

DUKINFIELD, or **Duckinfield**, a town of Cheshire, England, on the bank of the Tame,

opposite Ashton-under-Lyne, Lancashire, of which it is a suburb, 7 m. E. of Manchester; pop. in 1871, 26,329. There are extensive coal mines, one of which is 2,070 ft. deep. The growth of the town from a population of 1,737 in 1801 is due to its cotton manufactures.

DULAURE, **Jacques Antoine**, a French author and statesman, born at Clermont-Ferrand in 1755, died in Paris, Aug. 19, 1835. He studied architecture and engineering, but turned his attention to literature, and on the breaking out of the revolution joined the republican party. In 1792 he was elected member of the convention, in which he voted for the execution of the king, but afterward became connected with the Girondists. During the reign of terror he supported himself in Switzerland as an engraver. He afterward returned to France and was elected to the council of 500, but retired from public life after the revolution of the 18th Brumaire, 1799. Among his works are: *Histoire civile, physique et morale de Paris* (7 vols. 8vo, 1821; latest ed. by Leynadier, 8 vols., 1856), and historical sketches of the revolution (6 vols., 1823-'5). As a historian he has not the reputation of impartiality.

DULCAMARA, the name under which the dried young branches of *solanum dulcamara* (bittersweet or woody nightshade) are used in medicine. Its virtues, which are supposed to depend partly at least upon the alkaloid solania, are entirely extracted by water, and it is generally given in decoction. It is slightly narcotic and diuretic, but is not largely used. It is given also in solid extract, fluid extract, and infusion. The dose of the decoction is about four tablespoonfuls; of the fluid extract, half a teaspoonful to a teaspoonful.

DULCE. **I.** A lake of Guatemala, on the E. coast, near the gulf of Honduras, with which it communicates through a smaller lake, called the Golfete, and the river Dulce or Angostura. It is also called Lake Izabal. It is about 30 m. long by 12 broad, and has from 30 to 60 ft. of water in the deeper parts, shoaling gradually toward the shores. It is formed apparently by the expansion over a valley of the waters of the river Polochic, which enters it on the west. On its S. bank is the little village of Izabal. The Golfete is 15 m. long by 3 broad, and has a depth of from 12 to 15 ft. The Rio Dulce, through which both lakes reach the sea, is a narrow strait winding through densely wooded and almost perpendicular hills. A bar at its mouth prevents the entrance of vessels drawing over 6 ft. On the left bank is the little village of Livingston, named after the founder of the Louisiana code, which was once adopted in Guatemala. **II.** A gulf of Costa Rica, on the Pacific coast, formed by a peninsula whose point, Cape Matapalo, is in lat. 8° 3' N., lon. 83° 15' W. It covers an area of about 800 sq. m. A river of the same name flows into the gulf near its N. extremity, after a course of 75 m. **III.** A river of the Argentine

Republic, which rises in the mountainous district of the province of Tucuman, about lat. $25^{\circ} 45' S.$, lon. $65^{\circ} 50' W.$, and after a S. E. course of 400 m. loses itself in Lake Porongos. According to some authorities, it passes through the lake and empties into the Rio Salado. Its banks are low and are often inundated in the wet season. Above Santiago it is called the Hondo, and at its head the Tala.

DULCIGNO (Turkish, *Olgun*; anc. *Olcinium*), a town of Albania, European Turkey, on the Adriatic, 18 m. W. S. W. of Scutari, and 6 or 7 m. N. W. of the river Bojana; pop. about 8,000. It is on an isolated hill forming a cape which is united to the mainland by an isthmus. It contains a strong castle, has about 1,000 houses, and is the seat of a Roman Catholic bishop. It surrendered to the Romans at the commencement of the hostilities with Gentius, king of the Illyrians, in 167 B. C., and in consequence received the privilege of freedom and exemption from taxation. The Venetians suffered a great defeat here in 1718, their fleet and army being annihilated by a storm and the attack of the Turks. Its inhabitants were once known, under the name of Dulcignottes, as the most formidable pirates of the Adriatic. They now live mostly by agriculture.

DULCIMER, an ancient musical instrument, resembling, if not identical with, the psaltery or *nebel* of the Jews. The modern dulcimer consists of a small box, in shape a triangle or a trapezium, containing a number of wire strings stretched over a bridge at each end, and struck with little iron rods or wooden sticks in the hands of the performer.

DULONG, *Pierre Louis*, a French naturalist, born in Ronen, Feb. 12, 1785, died in Paris, July 19, 1838. He studied medicine, which he practised for some time, and then devoted himself to physical science. After numerous analyses and researches upon chlorine and ammonia, he was led in 1811 to the discovery of the chloride of nitrogen. He was twice injured by the explosions of this new compound, and lost an eye and a finger. In 1816 he discovered hypophosphorous acid, and introduced into the nomenclature the prefix *hypo*, to denote a less degree of oxidation. In 1820 he labored with Berzelius in the laboratory of Berthollet, and investigated the origin of animal heat. He found that in the carnivora the heat due to the transformation of oxygen into carbonic acid is not more than one half of the whole, and in the herbivora even a smaller proportion. In 1825 he was appointed on the commission to provide precautions against the explosion of steam boilers; and for four years he labored almost alone with Arago in determining the elastic force of steam at different temperatures. Dulong was a member of the academy of sciences, and in 1832 succeeded Cuvier as perpetual secretary for the department of physical sciences. His numerous works treat particularly of gases and heat.

DULSE. See *ALGÆ*.

DULUTH, a city, port of entry, and the capital of St. Louis co., Minnesota, at the S. W. extremity of Lake Superior, about 145 m. N. N. E. of St. Paul, opposite and 7 m. N. of Superior City, Wis., in lat. $46^{\circ} 48' N.$, lon. $92^{\circ} 6' W.$; pop. in 1870, 3,131, of whom 1,865 were foreigners; in 1873, over 5,000. It is picturesquely situated on the side of a hill which overlooks the lake and rises gradually toward the N. W., reaching the height of about 600 ft. at the distance of a mile from the shore. The buildings are of wood, but blocks of brick and brown stone are in process of construction. The average temperature for the year ending Sept. 30, 1872, was 38.7° , the coldest month being December (7.7°), and the warmest August (68.1°). The rainfall was 34.44 inches. From the hill, looking S., a fine view of the harbor may be obtained. On the extreme right are St. Louis river and bay, shut in by Rice's point on the Minnesota side and Connor's point in Wisconsin, between which there is a narrow outlet. On the left of these is a body of water dotted with islands, known at the N. end as Duluth bay or the inner harbor, and at the S. as Superior bay. Duluth bay is enclosed by Minnesota point, 7 m. long, which stretches nearly across the head of the lake, and has a lighthouse on its extremity; Superior bay is shut in by Superior or Wisconsin point, between which and Minnesota point there is a channel, called the "entry," 600 ft. wide, obstructed by shifting sand bars, which forms the only natural entrance to the inner harbor. On the left of Minnesota point is the outer harbor, protected by a breakwater about a mile beyond. The obstructions of the "entry" are avoided by a ship canal, 250 ft. wide and 16 ft. deep, through the upper part of the point, protected by piers, on the southern one of which a lighthouse is in course of erection. A dike, $1\frac{1}{2}$ m. long, was constructed in 1872 from Minnesota point to Rice's point, completely shutting in Duluth bay from the "entry," but a passage for vessels has been cut through it. The harbor is open about 200 days in the year. Several docks, besides the extensive works of the railroad companies, have been built, and when the improvements in progress and contemplated by the United States government are completed, the city will have a dockage front of 20 m., affording accommodation for the largest vessels. The Northern Pacific and Lake Superior and Mississippi railroads terminate here, and six regular lines of steamers run to Chicago, Cleveland, Canadian ports, and the ports on the S. shore of Lake Superior. The commerce of Duluth, situated as it is in the vicinity of the mineral districts on both shores of the lake, surrounded by a well timbered country, and offering the most convenient outlet for the products of the wheat region further W., is of growing importance. The number of vessels arriving in 1870 was 158; in 1871, 263, with an aggregate tonnage of 161,567; in 1872, 369 (217 Ameri-

can and 61 foreign steamers and 91 American sailing vessels), with a tonnage of 204,159; 76 were from foreign ports and 293 coastwise. The value of goods entered at the custom house in that year was \$1,205,722, of which \$676,-571 paid duties, \$141,018 remained in warehouse, and \$388,133 were bonded to Canada. One large grain elevator is in operation, and another is in process of construction, with a capacity of 1,000,000 bushels. Duluth is the seat of a United States land office. A dry dock, capable of accommodating the largest vessels, is in course of construction on Minnesota point. There are 3 large steam saw mills, 1 shingle mill, 2 planing mills, 1 iron foundry (manufacturing engines, boilers, cars, and stoves), 1 manufactory of sashes, doors, woodwork for cars, &c., 1 wagon factory, and 1 railroad machine shop. The total value of manufactures in 1872 was about \$450,000, including 7,500,000 feet of lumber, 1,000,000 shingles, and 1,500,000 laths. A blast furnace with capacity for the production of 6,500 tons of pig iron annually went into operation in November, 1873. The city contains a national bank, with a capital of \$100,000, a state bank with \$60,000, and a savings bank with \$50,000 capital. It is governed by a mayor and a common council of eight members (two from each ward). The assessed value of property in 1872 was \$1,927,120. The amount expended during the year in the erection of business houses and manufactories, and on public improvements, was about \$1,200,000, including \$70,000 on street improvements, \$80,000 on dike, \$75,000 on canal, \$135,000 on docks, \$75,000 in dredging, and \$55,000 on breakwater. There have been 20 m. of streets graded, and 10 m. of sidewalks built. There are a high school, six preparatory schools, two reading rooms, a library of about 1,000 volumes, two daily and three weekly newspapers, and 12 churches—Baptist, Congregational, Episcopal, German Lutheran, Methodist, Norwegian Lutheran, Presbyterian, Roman Catholic, Swedish Lutheran, and Swedish Methodist.—Duluth derives its name from Jean du Luth, a French officer, who visited the region in 1679. In 1860 there were only 71 white inhabitants, and the number had not much increased in 1869, when the place was selected as the eastern terminus of the Northern Pacific railroad.

DULWICH, a suburb of London, in Surrey, 4½ m. S. S. E. of St. Paul's cathedral, and near Sydenham; pop. in 1871, 4,041. It is chiefly remarkable for its college, founded and endowed in 1619 by Edward Alleyn, a distinguished actor. The college originally consisted of a master, warden, 4 fellows, 6 poor brethren, 6 poor sisters, 12 scholars, and 30 out members. Its income from endowment in 1626 was £800, but through the rise in the value of the estates this has increased to £14,000. The college was reorganized by act of parliament in 1857, and some gross abuses were corrected. One fourth of the revenue is now devoted to

the support of aged people, and the remainder to the educational department, to which boys are admitted on payment of a moderate fee. It supports 24 foundation scholars; and the master must always bear the name of Allen. It has a valuable picture gallery, mainly contributed by Sir Francis Bourgeois in 1810.

DUMANOIR, **Philippe François Pinel**, a French playwright, born in Guadeloupe in July, 1806, died at Pau in November, 1865. He received his education in Paris, and his first play, produced at the Variétés theatre, *La semaine des amours*, was received with favor. He left nearly 200 plays, most of which have been published. Among his most popular pieces are *Don César de Buzan* and *Les premières armes de Richelieu*. D'Ennery was his collaborator in the former, and Bayard in the latter. From 1836 to 1839 he was manager of the Variétés. His *Écoles des agneaux* obtained a gold medal from the minister of state in 1855.

DUMAS. **I. Alexandre Davy (de la Pailletterie)**, a French general, born at Jérémie, Hayti, March 25, 1762, died at Villers-Cotterets, France, Feb. 26, 1806. He was the son of the marquis de la Pailletterie by a negro girl, was sent to France to be educated, and at the age of 14 enlisted, under his mother's name of Dumas, in a cavalry regiment. He was noted for his vivacious temper, handsome figure, and prodigious strength, but at the end of 16 years he was merely a non-commissioned officer. Serving under Dumouriez, he performed several daring acts, and then rapidly passed through every rank, until in September, 1793, he was general of division. In 1796 and 1797 he served in Italy under Bonaparte, and at the battle of Brixen he alone defended a bridge against the enemy, giving the French time to come to the rescue. Bonaparte presented him to the directory as "the Horatius Cocles of the Tyrol." He served with distinction in Egypt, but upon some disagreement with Berthier departed for France. The ship being obliged to put into Taranto, he was arrested by the Neapolitan government and detained for two years. After his release the first consul declined to give him an appointment on account of his republican principles.

II. Alexandre Davy, a French dramatist and novelist, son of the preceding, born at Villers-Cotterets, July 24, 1803, died at Puy, near Dieppe, Dec. 5, 1870. After his father's death his mother sent him to school, where he became a good horseman, billiard player, fencer, and shot. At the age of 15 he was placed as copying clerk with a notary; at 18 he began to write for the stage, though none of the plays produced at this period were accepted; and at 20 the pressure of family difficulties sent him to Paris, where Gen. Foy procured for him a small office in the household of Louis Philippe, then duke of Orleans, with a salary of 1,200 francs. He devoted his leisure to completing his imperfect education, wrote some light poems, and in 1825 with MM. Rousseau and De Leuven produced a play called *La chasse et l'amour*.

His first pieces were mostly anonymous vaudevilles; tragedy engaged his attention for a while, but he soon abandoned it. His genius was awakened by the performances of an English company, which in 1827 presented some of Shakespeare's plays in Paris; in common with several of his contemporaries, he felt that the French stage needed reform, and he resolved to be one of the apostles of the new dramatic creed. He brought out on Feb. 11, 1829, a historical play, *Henri III. et sa cour*, constructed with utter disregard of the ordinary rules. It created a sensation, and though assailed by the critics was applauded by the public. Dumas realized from it 30,000 francs in a few months. *Christine, ou Stockholm, Fontainebleau et Rome*, another historical drama in verse, was also well received; and new pieces from him appeared in rapid succession, which, while eliciting severe criticism, drew crowded houses. *Antony* (produced in 1831), if not the best, is the most characteristic production of its author. *Richard d'Arlington* and *Térésa* followed. *Le mari de la veuve* appeared in April, 1832; and the *Tour de Nesle*, first represented in the following month, ran more than 200 successive nights; the germ of this piece had been furnished by Frédéric Gaillardet, but its details, character, and pathos belonged to Dumas. *Angèle* came out in 1833, *Catherine Hovard* in 1834, and *Don Juan de Marana*, a fantastic drama, and *Kean* in 1836; the last was written expressly for Frédéric Lemaître. A Roman tragedy, *Caligula*, and *Mlle. de Belle-Isle* followed. Dumas had meanwhile entered the field as a novelist, beginning in 1835 with *Isabelle de Bavière*, a romantic picture of France in the 15th century. His intention was to give, under the title of *Chroniques de France*, a series of novels treating of the most interesting incidents of French history. These, and his *Impressions de voyage*, narrating his travels through Switzerland and Italy, were eagerly read. *Les trois mousquetaires* and *Le comte de Monte Cristo*, both of which appeared in 1844, gave a new character to his reputation. The success of these and similar books was only equalled by the wonderful rapidity with which they were produced. In 1846 he made a contract to furnish two newspapers with an amount of manuscript equal to 60 volumes a year; and this exclusive of his plays and other occasional productions. Such fecundity raised the question whether he was really the author of the books bearing his name. A lawsuit in which he was involved in 1847 with the directors of the *Presse* and *Constitutionnel* brought to light the fact that he had engaged to furnish those journals with more volumes than a rapid penman could even copy; but though he made liberal use of the talents of assistants, he claimed sufficient share in the plan and execution of every work to make it truly his own. A judicial decision finally supported his claim. His daily work aver-

aged 32 pages of an ordinary octavo volume. Among his novels are *Les mémoires d'un médecin*, or rather *Joseph Balsamo*, *Le collier de la reine*, *Ange Pitou*, and *La comtesse de Charny*, a romantic review of the latter part of the 18th century. Novel writing did not withdraw Dumas from the drama; besides adapting for the stage some of his most successful romances, he wrote original pieces, such as *Un mariage sous Louis XV.*, *Les demoiselles de St. Cyr*, *Le comte Hermann*, *La jeunesse de Louis XIV.*, and *La conscience*. He also published historical books: *Louis XIV. et son siècle*, *Le drame de 93*, *Le régent et Louis XV.*, *Florence et les Médicis*. In 1852 he began the publication of his *Mémoires*, a curious autobiography, which also presents interesting sketches of literary life during the restoration. Though a republican, Dumas was on terms of friendship with the royal family of Orleans, used his influence to elicit from them acts of benevolence, and when they were exiled from France he was bold enough to praise the young princes in several public meetings. He tried now to acquire political importance through the publication of a daily newspaper, *La Liberté*, and afterward a monthly review, *Le Mois*; but failing in this attempt, he published for two or three years the brilliant *Mousquetaire*, which he revived in 1857 under the title of *Monte Cristo*, and in which he continued his romances, translations, *Mémoires*, &c. Previous to 1848 his pen procured him a very large income, and he had undertaken, near St. Germain, the building of a country seat, which became celebrated under the name of *château de Monte Cristo*. The revolution cutting short his means, the château, upon which he had expended 450,000 francs, was sold in 1854 at auction for less than a tenth of its original cost. Dumas married in 1842 Ida Ferrier, an actress of the Porte St. Martin. Three years afterward she went to Florence, and died there in 1859. In 1852 he went for a time to Belgium; in 1858 he travelled in Russia, the Caucasus, Greece, and Turkey, and returned to Paris in the spring of 1859. Among his works published in 1858 were *Le capitaine Richard* (3 vols.), *L'Horoscope* (3 vols.), *Les louves de Macheoul* (10 vols.), and *L'honneur est satisfait*, a prose comedy in one act. In 1859 appeared *De Paris à Astrakan*, a sketch of his recent travels. In 1860 he was attached to the expedition of Garibaldi, and published *Mémoires de Garibaldi* and *Mémoires d'Horace*. In the spring of 1870 he went to Madrid to collect materials for a work on Spanish history. A few weeks gave him all the information he cared for, and he returned to Paris. But the war having begun, his MS. could not be profitably used, and he left Paris for Dieppe, was there taken ill, and died on the day when the Prussians entered the city. His remains were removed from the cemetery at Puy, April 15, 1872, to a grave beside his mother's in his na-

time village. The science of gastronomy was one of his favorite pursuits, and his *Grand dictionnaire de cuisine* was published in 1873. The English translations of his principal novels have attained an immense circulation in the United States. The most popular are "The Count of Monte Cristo," "The Three Guardsmen," "Twenty Years After," "The Vicomte de Bragelone," "Margaret of Anjou," and "The Memoirs of a Physician" and its continuations. "The Life and Adventures of Alexandre Dumas," by Percy Fitzgerald (London, 1873), contains some characteristic anecdotes.

III. *Alexandre*, a French novelist and dramatist, natural son of the preceding, born in Paris, July 28, 1824. At 17 he published a volume of light poems under the title of *Péchés de jeunesse*; then he took to novel writing, and produced *Aventures de quatre femmes et d'un perroquet*, *Le roman d'une femme*, *Le docteur Servans*, *Trois hommes forts*, and *La vie à vingt ans*, which indicated neither extraordinary talent nor originality. But the *Dame aux camélias* (1848) showed him under a new aspect. This was the history, slightly embellished, of a woman of the town, Marie Duplessis, with whom he had been on intimate terms, and who had lately died of consumption. His following novels, *Diane de Lys*, *La dame aux perles*, &c., attracted no particular attention, and he then dramatized the *Dame aux camélias*. It drew crowded houses at Paris and all over France, and was set to music by Verdi in his *Traviata*. In the United States several versions were presented at once on the stage. *Diane de Lys* underwent a similar transformation, but not with the same success; and then Dumas wrote original pieces. *Le demi-monde*, performed in 1855, gave new evidence of acuteness of observation, dramatic power, and cutting wit. The same merits are perceptible in *Le fils naturel* and *La question d'argent*, the former a mere drama of the imagination, the latter a satire on the worship of money. *Le père prodigue* appeared in 1859, *L'ami des femmes* in 1864, *Le supplice d'une femme* (with M. de Girardin) in 1865, *Les idées de Mme. Aubray* in 1867, and a complete edition of his dramatic works in 1868. He has also published additional novels. His drama *La femme de Claude* was produced in 1872, and his *Homme-femme* has been translated by George Vandenhoff ("Man-Woman, or the Temple, the Hearth, and the Street," 1873). His new play *Monsieur Alphonse* (1873) was very successful. He was elected to the French academy Jan. 29, 1874.

DUMAS, Jean Baptiste, a French chemist and politician, born in Alais, July 14, 1800. Under the patronage of De Candolle, at Geneva, he early acquired considerable proficiency as a botanist and a chemist. In 1821 he went to Paris, married the daughter of Alexandre Brongniart, and was professor of chemistry in the polytechnic school, in the faculty of science, and in the school of medicine. After the revo-

lution of 1848 he was elected to the legislative assembly, and on Oct. 31, 1849, became minister of agriculture and commerce. After the *coup d'état* of Dec. 2, 1851, he was appointed a senator. In 1868 he was elected perpetual secretary of the academy; and in 1869 the London society of chemistry gave him the Faraday medal. He has published *Traité de chimie appliquée aux arts* (8 vols. 8vo, with 4to atlas, 1828-45), *Leçons sur la philosophie chimique* (1837), *Essai sur la statique chimique des êtres organisés* (1841), *Enquête sur les engrais* (1867), and other works.

DUMAS. I. Matthieu, count, a French soldier and historian, born in Montpellier, Nov. 23, 1753, died in Paris, Oct. 16, 1837. In 1780 he sailed from Brest as aide-de-camp to Rochambeau, commander of the French troops sent to assist the Americans, and participated in nearly all the important actions of the war, including the victory of Yorktown. He was afterward for two years employed in the exploration of the seacoasts and islands of Turkey. At the beginning of the revolution he sided with Lafayette and the constitutional party. When Louis XVI. was arrested at Varennes he commanded the troops who accompanied him to Paris. As a member of the legislative assembly he evinced wisdom, firmness of opinion, and considerable oratorical power. During the reign of terror he was sentenced to death, but escaped to Switzerland. After the 9th Thermidor he returned to France, and was afterward elected to the council of 500. Being proscribed as a monarchist on the 18th Fructidor, he fled to Germany, where he commenced his annals of military events. Returning to his country under the consulate, he was intrusted with several important missions. In 1806 he followed Joseph Bonaparte to Naples, was appointed by him minister of war, and organized the Neapolitan army. On the removal of Joseph to Spain he reentered the French army, and actively participated in the campaigns of 1808 in Spain and 1809 in Germany. He was superintendent of the administrative service of the Russian expedition in 1812, escaped the dangers of the disastrous retreat, was made prisoner in Germany in 1813, was liberated on the peace of 1814, and served the Bourbons during the first restoration. On the return of Napoleon from Elba he refused to join him; but yielding to the entreaties of Joseph Bonaparte, he superintended the organization of the national guards. For this he was placed on the retired list when Louis XVIII. resumed the crown. He now continued his *Précis des événements militaires*, giving a copious and lucid account of military operations from 1799 (19 vols., Paris, 1816-26). The almost total loss of his sight disabled him from completing his work, but did not prevent him from translating a portion of Napier's "History of the Peninsular War" as a supplement to it. He was elected to the chamber of deputies in 1827,

evinced decision and energy during the revolution of 1830, and was instrumental in the elevation of Louis Philippe to the throne. Besides the work above mentioned, he left some interesting personal memoirs, since published by his son under the title of *Souvenirs*. **II. Chrétien Léon**, count, a French soldier, son of the preceding, born in 1800, died at Passy, Feb. 20, 1873. He served in Spain in 1823, and subsequently in Algeria, was severely wounded at the siege of Constantine, and became the principal aide-de-camp of Louis Philippe. After the revolution of 1848 he joined the Orleans family in England, and attended the count d'Eu, son of the duke de Nemours, on his marriage, Oct. 15, 1864, with the princess Isabella of Brazil. He returned with the Orleans princes to France during the German invasion, and fought gallantly.

DUMBARTON, a royal, parliamentary, and municipal burgh and seaport of Scotland, chief town of Dumbartonshire, situated on the left bank of the Leven, near its junction with the Clyde, 13 m. N. W. of Glasgow; pop. in 1871, 11,414. It consists of one long semicircular street, and smaller streets and alleys diverging from it. On the opposite bank of the river is the suburb of West Bridgend, connected with it by a stone bridge. The principal business is ship building, both in wood and iron, there being five large yards employing over 3,000 men. A marine engine factory employs 400 men, and there are also two founderies, a forge, glass and bleaching works, a manufactory of patent windlasses, and a brewery.—Dumbarton is supposed to have been the Roman station Theodosia. At the confluence of the Leven with the Clyde, a mile below the town, is Dumbarton castle, famous in Scottish history, on an isolated precipitous rock upward of 500 ft. high and about a mile in circumference at the base. It is known to have been a stronghold 1,000 years ago, and it has sustained many sieges. Sir William Wallace was imprisoned here before being taken to London for execution.

DUMBARTONSHIRE, a W. county of Scotland, anciently called Lennox, consisting of two detached portions, the larger lying between Lochs Lomond and Long and the frith of Clyde, the smaller between the counties of Lanark and Stirling; area, including a portion of Loch Lomond, 320 sq. m.; pop. in 1871, 58,839. The surface is mostly mountainous, and the soil, except in the lowlands, is poor. The best land, however, is highly cultivated, producing potatoes, grain, beans, and turnips. Large tracts are devoted to pasturage, and there are several nurseries for raising timber. The principal minerals are coal, ironstone, limestone, and slate. Capital, Dumbarton.

DUMBUM, a town and military station of Bengal, British India, 6 m. E. N. E. of Calcutta. It is the headquarters of the Bengal artillery, and the seat of a training school for young officers and recruits from England. It

contains handsome establishments for the officers, a large church, a free school, a depot of musketry, and a cannon foundry.

DUMÉRIL. **I. André Marie Constant**, a French physician and naturalist, born in Amiens, Jan. 1, 1774, died in Paris, Aug. 2, 1860. From 1800 to 1818 he was professor of anatomy and physiology, and subsequently of pathology, in the medical faculty of Paris. In 1825, on the death of Lacépède, whose adjunct professor he had been for 22 years, he assumed his functions as professor of herpetology and ichthyology at the museum of natural history. During four years he also lectured on natural history in the central school of the Pantheon in place of Cuvier. In his most celebrated production, *L'erpétologie générale* (10 vols. 8vo, with an atlas of plates, 1835-'50), which contains the first attempt at a systematic description of all known reptiles, he had Bibron as collaborator. His other principal works are *Éléments des sciences naturelles* (5th ed., 1848), *Ichthyologie analytique* (1856), and *Entomologie analytique* (2 vols. 4to, 1860). **II. Auguste Henri Audré**, son of the preceding, born in Paris, Nov. 30, 1812, died there, Nov. 12, 1871. He studied medicine, taught natural history and geology at various colleges in Paris, and in 1857 succeeded his father as professor in the museum of natural history. In 1869 he was elected as a member at large of the academy of sciences. He wrote *Des odeurs, de leur nature et de leur action physiologique* (1843), *Histoire naturelle des poissons* (vol. i., 1865), and many disquisitions relating to reptiles and fishes.

DUMFRIES, a royal, parliamentary, and municipal burgh of Scotland, capital of Dumfriesshire, situated on the left bank of the Nith, 6 m. from its mouth and 64 m. S. by W. of Edinburgh; pop. in 1871, 15,435. It is irregularly built, but the streets are wide, well paved, and well lighted. Many of the houses, which are generally of red sandstone, are remarkable for elegance, and there are many handsome villas on the hills overlooking the town. There are 13 churches of different denominations, 4 endowed and 30 unendowed schools, and a number of charitable, literary, and scientific institutions. The chief manufactures are woollen cloths, hats, hosiery, shoes, and baskets. There are also large tanneries and breweries. Weekly cattle markets are held on an open space by the river called the "Sands," where large numbers of live stock are transferred to English dealers. Maxwelltown, a suburb on the opposite side of the river, is connected with the town by two bridges, one ancient, the other a handsome modern structure.—Dumfries dates as a burgh from the reign of David I. In 1306 John Comyn was stabbed here by Robert Bruce in the chapel of the Minorite convent. The town was often plundered and burned in the border wars. Robert Burns resided here for several years preceding his death, and his monument is in the burial ground of St. Michael's church.

DUMFRIESSHIRE, a S. county of Scotland, bordering on England and Solway frith; area, 1,098 sq. m.; pop. in 1871, 74,794. A large portion of its surface is mountainous, especially in the N. and N. E. parts, where there are summits nearly 3,000 ft. above the sea. There are many lochs, the principal of which are Castle loch of Lochmaben, and Loch Skene, 1,300 ft. above the sea, whose waters form the cascade called the Gray Mare's Tail. Three rivers, the Nith, the Annan, and the Esk, give their names to the three popular divisions of the county, Nithdale, Annandale, and Eskdale; and besides these there are a few smaller streams. Limestone is found in considerable quantities, and there are mines of coal and lead, and some manufactures; but agriculture, and especially the rearing of cattle, sheep, and pigs, are the principal occupations. The county was included by the Romans in the province of Valentia. Capital, Dumfries.

DÜMICHEN, Johannes, a German Egyptologist, born at Wissholz, Silesia, Oct. 15, 1833. He studied at the university of Berlin, went several times to Egypt, and each time made valuable discoveries relating to the ancient history and language of that country. He returned to Egypt in 1871 with the archaeological expedition sent out by the emperor of Germany. One of his remarkable discoveries is a history of the first foundation and successive restorations of the temple of Denderah, which he found in a secret passage, and of which he has given a translation in his *Bauurkunde der Tempelanlage von Dendera* (Leipsic, 1865). He has also published *Historische Inschriften altägyptischer Denkmäler, in den Jahren 1863-'75 an Ort und Stelle gesammelt* (1867-'70); *Altägyptische Tempelinschriften* (1867); *Die Flotte einer ägyptischen Königin aus dem 17. Jahrhundert vor unserer Zeitrechnung* (1868); *Der Felsentempel von Abu-Simbel* (1869); and *Photographische Resultate einer auf Befehl des Kaisers von Deutschland nach Aegypten entsendeten archäologischen Expedition, mit Erläuterungen* (Berlin, 1872).

DUMMER, Jeremiah, an American scholar, born in Boston about 1680, died in Plaistow, England, May 19, 1739. He graduated at Harvard college in 1699, where he was noted for the vigor and brilliancy of his genius. He studied theology, and afterward spent several years at the university of Utrecht. Soon after his return to America he was sent to England as agent of Massachusetts, and rendered important services. He was intimate with Bolingbroke, and adopted some of his views. He published theological and philosophical disquisitions in Latin while at Utrecht, and a "Defence of the New England Charters" (London, 1728; reprinted, 1765).

DUMONT, Pierre Etienne Louis, a Swiss scholar, born in Geneva, July 18, 1759, died in Milan, Sept. 30, 1829. He was ordained a minister of the Protestant church of Geneva in 1781, and distinguished himself as a preacher, at the

same time taking a warm interest on the liberal side in the political controversies of his native city. In consequence of the triumph of the aristocratic faction, he went in 1783 to St. Petersburg, where his father had formerly been court jeweller. Here he became pastor of the French Reformed church, and his eloquence attracted much attention; but after a residence of 18 months he went to London, and became in 1785 teacher of the second son of Lord Shelburne. Here he became acquainted with Romilly and Bentham, with the writings and ideas of the latter of whom he was so much impressed as to conceive the scheme of bringing them out in a French version. At the request of the Genevan exiles in London, Dumont in 1789 made a journey to Paris in company with M. Duroverai, ex-attorney of the republic of Geneva. Their object was to attain through their countryman Necker support for the revolution already commenced at Geneva, and an unrestricted restoration of Genevese liberty. He immediately entered into very close relations with Mirabeau, assisting him in the preparation of his speeches, writing his published letters to his constituents, and becoming joint editor with him of a journal called the *Courrier de Provence*. The pecuniary ill success of this publication, the abatement of Dumont's sanguine hopes of political regeneration, the character of Mirabeau himself, and the attacks levelled at Duroverai and Dumont in journals and pamphlets, as being his tools, determined Dumont to leave Paris in March, 1791; but he revisited it several times in that and the following year, finally accompanying Talleyrand's embassy to England, and remaining there. His *Souvenirs sur Mirabeau*, written some ten years after, but which appeared posthumously, contains a very interesting account of his observations and experiences in Paris. After his return to England he devoted himself to drawing from the manuscripts and printed works of Bentham a lucid and popular view of that philosopher's system of jurisprudence. In 1802 he published in Paris the first instalment of his labors, *Traité de législation civile et pénale* (3 vols. 8vo). The work attracted great attention throughout Europe; and in 1806, while Lord Henry Petty, Dumont's former pupil, was chancellor of the exchequer, the sinecure clerkship which he had long held was superseded by a pension of £500. In 1811 he published at London another instalment, *Théorie des peines et des récompenses* (2 vols.), of which two editions appeared at Paris. In 1815 he published at Geneva *Traité des assemblées législatives*; in 1823 at Paris, *Preuves judiciaires* (2 vols.); and in 1828, *Organisation judiciaire et codification*. All these treatises reappeared in a single collection edited by Dumont, and published at Brussels in 1828, shortly before his death. These works owed almost entirely to the dress in which Dumont clothed them the attention which

they attracted, and the impression which they made; and to his labors Bentham was indebted for his wide-spread reputation in Europe, into the principal languages of which, including the Russian, the *Traité de législation* were translated. When Geneva recovered her liberties in 1814, Dumont hastened thither. He carried with him a small fortune, married, and spent there most of the remainder of his life. He was chosen a member of the sovereign representative council, and did what he could to liberalize and improve the institutions of his native city. In 1817 he laid before the magistrates a draft of a penal code, borrowed principally from Bentham's manuscripts, and accompanied according to Bentham's system with a running commentary of reasons. This was referred to a commission, of which Dumont was a member, and occasioned long and fruitless discussions. He was more successful in obtaining the establishment of a penitentiary on Bentham's panopticon plan.

DUMONT D'URVILLE, Jules Sébastien César, a French navigator, born at Condé-sur-Noireau, May 23, 1790, died May 8, 1842. In 1819-'20 he visited the Grecian archipelago and the shores of the Black sea, collected a number of new plants, of which he published descriptions, and investigated the ruins of several ancient cities. In 1822 he accompanied Duperrey in his voyage round the world, and returned in 1825, bringing a rich collection of insects and plants. He went on a second expedition (1826-'9) as commander, and explored the Australian archipelago and the islands of New Zealand and Papua. He discovered several islands which Cook had not perceived, established the locality of the Loyalty isles, and brought home more than 4,000 sketches of scenery and natural history, 10,000 specimens of animals, and more than 6,000 species of plants. In 1837 he undertook, with the sloops of war *Astrolabe* and *Zélée*, his last voyage, to explore the antarctic regions, and circumnavigate the globe through the southern seas. On his return in 1840 he was made rear admiral, and went to Paris to superintend the publication of the account of this voyage at the expense of the government. The second volume had been published when the author was killed, with his wife and son, in a railway disaster on the line of Paris and Versailles. The work was completed under the supervision of M. Vincendon-Dumoulin, in 24 vols. 8vo, with 6 folio vols. of illustrations (Paris, 1841-'54). The departments of zoölogy, botany, anthropology, geology, &c., were treated by special writers attached to the expedition.

DUMOURIEZ, Charles François, a French general, born in Cambrai, Jan. 25, 1739, died near Henley-upon-Thames, England, March 14, 1823. He served with distinction and was frequently wounded during the seven years' war, and afterward engaged in the war and intrigues which brought on the annexation of Corsica to France, and in the affairs of Poland pre-

vious to the first partition of that country. After the accession of Louis XVI. he was put in command at Cherbourg, where important improvements were accomplished under his direction. In 1787 he was appointed brigadier general. During the first years of the revolution he maintained friendly intercourse with the court, while gaining popularity with the revolutionists. A member of the club of Jacobins, he became in March, 1792, minister of foreign affairs in the cabinet formed by the Girondists. His counsels displeased the king; he also disagreed with his colleagues, who were dismissed, and he himself resigned. Assuming command of the French army on the N. E. frontier in August, 1792, he stopped by a series of brilliant operations the advance of the Prussians, who were repulsed at Valmy, Sept. 20. He now crossed the frontier, routed the Austrians at Jemmappes, Nov. 6, took possession of Brussels, and within one month completed the conquest of Belgium. After a visit to Paris, during which he was denounced as secretly negotiating for the rescue of the king, he planned the conquest of Holland; but having been defeated at Neerwinden, March 18, 1793, he plotted with the enemy the overthrow of the republic. The convention summoned him to appear at their bar, and on his refusal the minister of war, Beurnonville, and four commissioners were sent to arrest him. Dumouriez had them seized by some of his hussars and delivered to the Austrians; but he had mistaken the sentiments of his own troops, and was obliged to fly. This he did in company with the young duke de Chartres, the future king Louis Philippe, the soldiers firing at them while they escaped. He was coldly received by the Austrians, and after wandering about the continent went to England, where, in consideration of some secret services, he received a pension of £1,200. He then published his *Mémoires* and a series of pamphlets on the affairs of France. He is charged with having devised plans of military operations against the French, and given directions in 1814 to the allied armies for the invasion of France. However this may be, he did not succeed in conciliating the favor of the Bourbons, and never returned to France.—See *La vie et les mémoires du général Dumouriez*, by himself (3 vols. 8vo, Hamburg, 1794), translated into German and English.

DÜNA, or Southern Dvina, a river of Russia, rises in the small lake of Dvinez, near the source of the Volga, in the government of Tver, flows about 600 m. with a very circuitous course, but with a general W. direction, separating the governments of Vitebsk and Livonia from Wilna and Courland, and discharges into the gulf of Riga near the town of the same name. The principal towns on its banks are Vitebsk, Polotzk, Dünaaburg, Jacobstadt, Friedrichstadt, and Riga. Navigation is obstructed by rocks and shoals. In spring it is covered with numerous rafts of timber. The river is

connected by canals with the Volga, the Dnieper, the Beresina, the Niemen, and Lake Ilmen. Its waters abound in fish.

DÜNABURG, or **Dvinaburg**, a fortified town of Russia, in the government of Vitebsk, on the Düna, 110 m. S. E. of Riga; pop. in 1868, 27,822. It has a considerable trade and famous annual fairs. The principal exports are flax, hemp, tallow, and timber. It is connected by railway with Riga, St. Petersburg, and Khar'kov. The fortress, built in 1823, on a site chosen by Stephen Báthori in 1582, is an important strategical point. Dünaburg was founded by the Livonian knights in the 13th century, and was successively annexed to Poland, Sweden, and Russia, and has remained in the possession of the latter power since 1772.

DUNBAR, a seaport town of Haddingtonshire, Scotland, at the mouth of the frith of Forth, 27 m. E. by N. of Edinburgh; pop. in 1871, 3,320. It has manufactories of soap, iron, steam engines, sail cloth, and cordage, and some trade. Vessels of 300 tons can enter the harbor, but the navigation is somewhat dangerous. Dunbar is a place of great antiquity, and its castle, now in ruins, was formerly a famous stronghold. In 1296 the Scots were defeated here with great slaughter by the English army of Edward I. In 1337 Black Agnes, countess of Dunbar, defended the castle for nearly five months against the earl of Salisbury. Another important battle was fought near this town in 1650 between Cromwell with 11,000 men and Gen. Lesley at the head of a Scottish army twice as large, in which the latter was decisively defeated.

DUNBAR, William, a Scottish poet, born in Salton about 1460, died about 1525. He received the degree of master of arts from the university of St. Andrews in 1479, became a Franciscan friar, and travelled over England and France. Returning to Scotland, he was received at the court of James IV., whom he delighted with his poetical compositions, and with the charms of his conversation. His poems show a mastery of almost every kind of verse. Some of them were printed in 1508; many remained for two centuries in manuscript, but their fame has steadily increased since their publication at Edinburgh and Perth in 1770 and 1778. "The Thistle and Rose" was a nuptial song to celebrate the marriage of King James IV. with the princess Margaret of England. "The Dance" is an imaginative poem, in which Mahoun (a name of Satan derived from Mohammed) asks his principal ministers to entertain him with a mummery, whereupon the seven deadly sins present themselves and deliver verses, which are severe criticisms upon the vices of the time. The short poem of "The Merle and Nightingale" is a picture of the contest between earthly and spiritual affections, the merle recommending a lusty life in love's service, and the nightingale declaring that all love is lost but upon God alone. All the poems of

Dunbar abound in allegory. A complete edition was published in Edinburgh in 1824 by David Laing, with a life of the poet.

DUNCAN, king of Scotland. See **MACBETH**.

DUNCAN, Adam, Viscount Duncan of Camperdown, a British admiral, born in Dundee, Scotland, July 1, 1731, died near Edinburgh, Aug. 4, 1804. He early entered the navy, was made a post captain in 1761, and distinguished himself under Keppel in the attack on Havana. In 1780 he was placed in command of a ship under Rodney, and in the engagement off Cape St. Vincent was the first to bring his vessel into action, capturing one of the heaviest of the Spanish ships. In 1787 he became rear admiral, and in 1795 admiral of the blue. In the latter year he took command of the united English and Russian squadron in the North sea, where within two years he annihilated the Dutch commerce. In 1797 he blockaded a large fleet under De Winter in the waters of the Texel, when a serious mutiny broke out in his own squadron. Insubordination had become general in the British navy, and Duncan had but two ships faithful to him. Yet when he advanced against the mutineers, their dissensions caused several of their ships to drop the red flag and return to duty, and the sedition was quickly ended. The Russian fleet was withdrawn. Duncan put into Yarmouth roads for repairs and provisions, where intelligence was brought to him that De Winter had put to sea. He immediately set sail, and with a favorable wind and by a masterly manœuvre placed himself between the Dutch and their retreat. The two fleets met between Camperdown and Egmont, within five miles of the coast, Oct. 11. De Winter was drawing fast toward the land, but Duncan began the action without waiting to form a line. De Winter maintained the contest for some time with his own flag ship after the rest of his fleet had either been captured or had quitted the action, and struck his colors only when his ship was entirely disabled. The loss of the English was 1,030 killed and wounded, while that of the Dutch was considerably greater. The English took nine sail of the line and two frigates. The victory created the utmost enthusiasm in England, where it was hailed as a presage of the downfall of the maritime power of Holland, long the most formidable rival of England on the seas. Duncan was rewarded with a peerage and a pension of £2,000. He remained in active service against the Batavian republic till 1800, after which he retired.

DUNCAN, Thomas, a Scottish artist, born at Kinclaven, Perthshire, May 24, 1807, died in Edinburgh, May 25, 1845. He was professor of coloring and drawing in the academy of Edinburgh, and an associate of the royal academy. His picture of "Charles Edward asleep after the battle of Culloden, protected by Flora McDonald," has been frequently engraved. Among the finest of his other pieces are "Charles Edward and the Highlanders enter-

ing Edinburgh, after the Battle of Prestonpans," and the "Martyrdom of John Brown of Priesthill." He excelled in portraits, of which he executed a large number.

DUNCKER. I. Karl, a German publisher, born in Berlin, March 25, 1781, died there, July 15, 1869. He was a clerk in a Leipsic and Berlin publishing house, and established in 1809 a house in the latter city, of which he became the sole proprietor in 1828, after the death of his partner Peter Humblot. The writings of Hegel, Ranke, and other celebrated authors were issued from his press. He sold his establishment in 1866 to K. Geibel of Leipsic, who continues it under the old firm name of Duncker and Humblot. **II. Maximilian Wolfgang**, a German historian, son of the preceding, born in Berlin, Oct. 15, 1811. He graduated at Halle, and became professor there in 1842. In 1848 he was a member of the Frankfort parliament and of the Prussian diet. His published strictures on the Prussian foreign minister, Manthey, interfering with his promotion at Halle, he went in 1857 as professor to Tübingen, and on the formation of the Hohenzollern cabinet went in 1858 to Berlin as an assistant in the ministry of state. In 1861 he was appointed councillor of the crown prince, and in 1867 director of the Prussian archives. His principal work is *Geschichte des Alterthums* (4 vols., Berlin, 1852-'7).—His brother, **FRANZ GUSTAV**, born June 4, 1822, a publisher of Berlin, was a leader of the German progressive party in 1848, member of the Prussian diet in 1861, a founder of trades unions in 1869, and in 1871 the chief of a movement for the promotion of culture among the people by a German national union. Another brother, **HERMANN**, is also prominent as a liberal politician.

DUNDALK, a seaport town and parliamentary borough of Ireland, in the county Louth, near the mouth of the Castletown river, 45 m. N. of Dublin; pop. in 1871, 10,893. It has a good harbor on Dundalk bay, and contains a number of schools and literary and benevolent institutions. The manufactures comprise flax spinning, machinery, and agricultural implements, ropes, soap, leather, pins, and starch; and there are also flour mills, breweries, and distilleries. Its trade is important and increasing, especially in agricultural products, which are largely exported. It is connected by railway with Belfast, Drogheda, and Dublin.

DUNDAS, an E. county of the province of Ontario, Canada, bordering on the St. Lawrence river, which separates it from New York; area, 377 sq. m.; pop. in 1871, 18,777. It is intersected by the Rivière de la Petite Nation, and crossed by the Grand Trunk railway. Its capital, Morrisburg, is a port of entry, and a stopping point for steamers plying between Montreal, Kingston, and Hamilton.

DUNDAS, Henry, Viscount Melville, a British statesman, born in Edinburgh about 1741, died there, May 27, 1811. He was of the ancient family of Dundas of Arniston, received his

education at the high school and university of Edinburgh, and was admitted to the bar in 1763. His celebrity as an advocate gained him the appointment of solicitor general in 1773; he was returned to the house of commons for the county of Edinburgh in 1774, and was made lord advocate of Scotland in 1775. He was afterward member of parliament for the city of Edinburgh till his advancement to the peerage. Though he had been a supporter of the administration of Lord North, his familiarity with affairs made him a valuable accession to the administrations of Rockingham and Shelburne, which quickly succeeded, in the second of which he held the office of treasurer of the navy. This ministry was obliged to give way before the combined opposition of Fox and Lord North, who came together in 1783 to form the coalition ministry, the opposition to which was headed by Pitt and Dundas. The latter had been appointed chairman of a secret committee of the house of commons to inquire into the condition of British India and the causes of the war in the Carnatic, and he made an elaborate report, in which he exhibited a complete mastery of the subject. When Pitt was called to the helm of affairs with a majority in parliament against him, he was powerfully aided by Dundas, who again held the office of treasurer of the navy, and in Pitt's absence led the ministerial party in the house of commons, and whose dexterity as a debater and minute acquaintance with Indian matters were of especial value in carrying Pitt's India bill through parliament against a very serious opposition. Dundas became president of the board of control under this bill in 1791, and entered the cabinet as secretary of state for the home department. He exchanged this post for that of secretary of war in 1794, when he introduced a bill for restoring the estates in Scotland forfeited on account of the rebellion of 1745. The investigations of Dundas into eastern affairs originated those discussions which terminated in the impeachment of Warren Hastings; but he took no active part either for or against Hastings. He was the principal supporter of Pitt during the wars with France, and resigned his offices upon the retirement of that statesman in 1801, when he laid before parliament a favorable statement of the condition of the East India company's affairs. In 1802 he was raised to the peerage with the titles of Viscount Melville and Baron Duneira, and on Mr. Pitt's return to power in 1804 became first lord of the admiralty. He quickly retired from this office, having incurred a charge of violating one of the statutes which he himself had proposed, by which the treasurer was forbidden to receive any perquisites or make any private or individual use of the public money. The articles of impeachment were prepared by the most celebrated leaders of the opposition, and the trial opened April 29, 1806. It resulted in the acquittal of Lord Melville by

triumphant majorities. From this time he took part only occasionally in the debates of the house of lords, and spent the most of his time in Scotland. Edinburgh contains two public monuments to his memory. He published several political pamphlets.—His only son, ROBERT, second Viscount Melville, born March 14, 1771, was first lord of the admiralty in 1812–27, during which time several arctic voyages were organized, and some discoveries were named after him. He again held the office in 1828–30, and died June 10, 1851.

DUNDEE, a royal and parliamentary burgh and seaport town of Forfarshire, Scotland, on the left bank of the estuary of the Tay, 36 m. N. N. E. of Edinburgh; pop. in 1871, 118,974. It occupies the declivity of a hill, whose summit is 525 ft. above the level of the sea, and is rather irregularly built. The modern streets are spacious and handsome. The principal

increase of £200,000 over those of the preceding year. There are railway connections with Perth and Edinburgh. Dundee is governed by a provost, four bailies, a dean of guild, a treasurer, and 21 councillors.—During the reigns of the Scottish kings Dundee was one of their places of residence. At the period of the reformation it was called “the second Geneva” for its zeal in behalf of Protestantism. In 1645 it was besieged, taken, and plundered by Montrose. In 1651 it was stormed by Gen. Monk, and a sixth part of its inhabitants massacred. A splendid public park, the gift of Sir David Baxter, was presented to the people of Dundee, Sept. 9, 1862, on which occasion a statue of the donor was unveiled.

DUNDONALD, Thomas Cochrane, earl of, more commonly known as Lord Cochrane, an English admiral, born Dec. 14, 1775, died Oct. 31, 1860. He was the eldest son of Archibald, ninth earl of Dundonald. At the age of 17 he

Dundee.

public edifices are the churches, which are very numerous, the old Gothic tower, 156 ft. high, the town hall, custom house, exchange, infirmary, lunatic asylum, industrial school, orphan institution, academy, and savings bank. In the centre of the town is a large market place, from which the principal streets diverge. Some of the docks are large and magnificent. King William's dock has an area of $6\frac{1}{2}$ acres, Earl Grey's of $5\frac{1}{2}$ acres, and the Victoria dock of $14\frac{1}{2}$ acres. There are also several fine quays. The manufactures of coarse linen fabrics, which employ about 25,000 hands, and of jute, exceed those of any other place in Great Britain. It has also extensive manufactures of gloves and leather. Ship building, as well of iron as of wood, is also carried on. The commerce of Dundee is very considerable. In 1871 2,559 vessels of 418,401 tons entered the port. The exports to the United States in 1871 amounted to about £1,200,000, being an

entered the naval service, and during the war with France signalized himself in many actions. Some of his exploits in capturing vessels against great odds are among the most brilliant in the history of the British navy. In 1801 he was made a post captain for the capture of a Spanish frigate of far superior force to his own. In 1809 he successfully led a fleet of fire ships among the French fleet at anchor in the Basque roads. In 1807 he was elected to parliament for Westminster, and soon incurred the animosity of the govern-

ment by his radical opinions on questions of reform. In February, 1814, a rumor prevailed that Napoleon had abdicated, and Lord Cochrane took advantage of the consequent rise in the funds to sell out. He was charged with originating a false rumor, was convicted of fraud, and sentenced to pay a fine of £1,000, to stand in the pillory, and be imprisoned for a year. The pillory punishment was subsequently remitted. He was at the same time expelled from parliament. His constituents, believing in his innocence, which has since been fully established, immediately returned him to parliament again, and his fine was paid by public subscription. Finding it impossible to obtain employment at home, he attached himself successively to the Chilian, Brazilian, and Greek navies, in each of which he earned fresh laurels, and he was created marquis of Maranhão in Brazil. In 1830, on the accession of William IV. and a whig gov-

ernment, he returned to England, and was reinstated and made rear admiral. In 1851 he became vice admiral of the white, and in 1854 admiral of the United Kingdom. He was a man of considerable scientific attainments, and the author of "Observations on Rural Affairs" (1847), "Notes on the Condition of the British West India Islands" (1851), "Narrative of Services in the Liberation of Chili, Peru, and Brazil" (2 vols., 1859), and "Antobiography of a Seaman" (1860).—The succession to his title gave rise to a famous law case. His eldest son claimed the title, which was disputed by a younger brother, who aspersed the character of their mother. The case was decided (June 11, 1863) in favor of the eldest son, THOMAS BARNES COCHRANE (born April 18, 1814), the present earl.

DUNDRUM BAY, a bay of the Irish sea, on the coast of the county Down. Its entrance, which lies between St. John's point on the N. E. and the Mourne mountains on the S. W., is about 10 m. wide. It is subject to heavy swells during S. and S. E. winds. Near its N. side are two rocks called the Cow and Calf, connected with the mainland by a reef.

DUNEDIN, a city of New Zealand, capital of the province of Otago, on the S. E. coast of the Middle island, and the S. W. side of the harbor of Otago; pop. in 1871, 14,857; including the suburbs of Roslyn and Caversham, 21,511. The city is well paved, has a good supply of water from a reservoir at the head of Water of Leith valley, and is lighted with gas. Among the buildings are the post office, a hospital, and government structures, several banks, the athenæum and mechanics' institute, a masonic hall, and a Presbyterian church, one of the handsomest ecclesiastical buildings in the colony. It is the seat of a Protestant Episcopal and a Roman Catholic bishop, and in 1872 had 12 churches and a synagogue. A regular line of steamers connects Dunedin with Melbourne. The city was founded in 1848, but its more rapid progress dates from 1861, when extensive gold fields were discovered in the neighborhood.

DUNFERMLINE, a market town and parliamentary burgh of Fifeshire, Scotland, 13 m. N. W. of Edinburgh; pop. in 1871, 14,958. The houses on its principal streets are generally well built, and many of them have fine gardens. The first factory was established in Dunfermline in 1718, and it has since become one of the most flourishing of the northern manufacturing

towns. Its finest modern edifice is the abbey church, on the site of the ancient church of the abbey, long the place of sepulture of the Scottish kings, and which was destroyed at the

Dunfermline Abbey.

reformation. Beneath its pulpit are the remains of Robert Bruce, which in 1818 were discovered encased in lead.

DUNGANNON, a market town and parliamentary borough of Ireland, county Tyrone, 12 m. N. N. W. of Armagh, on the railway from Dundalk to Londonderry; pop. in 1871, 3,955. The town has Episcopal, Methodist, Presbyterian, and Roman Catholic places of worship, and a classical school founded in the reign of Charles II. There are manufactures of linen and earthenware. Dungannon was anciently the seat of the O'Neils, kings of Ulster. In 1782 the Ulster volunteers issued here their resolutions declaratory of the independence of Ireland.

DUNGARVAN, a maritime town and parliamentary borough of Ireland, county Waterford, principally situated on a peninsula in the estuary of the river Colligan, 25 m. W. S. W. of Waterford; pop. in 1871, 7,500. The river Colligan divides the town into two portions, connected by a bridge and causeway; the eastern is called Abbeyside. The public buildings are the provincial bank, a fine structure with granite front, two other banks, an Episcopal and two Roman Catholic churches, two convents, a monastery, a fever hospital, and a military barrack. The exports are chiefly grain, butter, and cattle. The inhabitants are largely engaged in hake and herring fisheries.

DUNGLISON, Robley, an American physician and author, born at Keswick, England, Jan. 4, 1798, died in Philadelphia, April 1, 1869. He graduated in medicine at Erlangen, Germany, in 1823, and in 1824 was called to the chair of medicine in the university of Virginia, which he held till 1833. He then accepted the professorship of materia medica and therapeutics in the university of Maryland, and in 1836

that of the institutes of medicine in Jefferson college, Philadelphia, which he held until a year before his death. He was a close student of philology and general literature, and enjoyed a high reputation for benevolence, which was especially exercised in giving time and services to the Philadelphia institution for the blind. His principal publications are: "Principles of Human Physiology" (2 vols. 8vo, Philadelphia, 1832; 8th ed., 1856); "New Dictionary of Medical Science and Literature" (2 vols. 8vo, Boston, 1833; 16th ed., revised and enlarged, under the title of "A Dictionary of Medical Science," 1 vol. 8vo, Philadelphia, 1865); "Elements of Hygiene" (Philadelphia, 1835; 2d ed., entitled "Human Health," 1844); "General Therapeutics" (8vo, 1836; 6th ed., 1857); "Medical Student" (8vo, 1837); "New Remedies" (1839; 7th ed., 1856); "Practice of Medicine" (2 vols., 1842; 3d ed., 1848). Dr. Dunglison also translated and edited several foreign medical works. A memoir by his son, Dr. R. J. Dunglison, was published in 1870.

DUNKELD, a town of Perthshire, Scotland, on the left bank of the Tay, 14 m. N. W. of Perth; pop. about 1,000. It lies in a picturesque valley, surrounded by mountains. W. of the town, near a bridge crossing the Tay, are the ruins of a cathedral of mixed Gothic and Saxon architecture, whose choir was built in 1330 by Bishop Sinclair. Bishop Lauder finished the nave in 1450, and the chapter house in 1469. The tower was completed in 1501. The building was 120 ft. long and 60 broad. The choir was repaired by the duke of Athol in 1845, and now forms the parish church. The unroofed nave and aisles are used as a cemetery, and contain some interesting monuments. The cathedral was held by a body of lowlanders against the highlanders after the battle of Killiecrankie, in 1689. It is said that the Culdees had a settlement here in 729. About 850 Kenneth II. removed the relics of St. Columba hither, and this was the seat of the primacy of Scotland until supplanted by St. Andrews. The old residence of the dukes of Athol is near by, and was partly rebuilt in 1830. It contains in its grounds two larches said to be the first brought into Britain. Dunkeld contains, besides the parish church, Free and Independent churches, and a royal grammar school founded by James VI.

DUNKERS, or **Tunkers**, a religious denomination founded in 1708, at Schwarzenau, Germany, by Alexander Mack and seven others, who, without any knowledge of the existence of other Baptists, were led by reading the Bible to the rejection of paedobaptism. The name Dunker or Tunker (from the German *tunken*, to dip) was originally given them as a nickname to distinguish them from the Menonites. They are also called Tumblers from their mode of baptism, which is by putting the person while kneeling head first under water. They are also called German Baptists, while they

themselves take the name of Brethren. In Germany they established two societies in addition to the original congregation, but these were soon driven by persecution to Crefeld and Holland, while the congregation removed voluntarily to Friesland. Between 1719 and 1729 they all emigrated to America, to which the denomination has since been confined. They are most numerous in Pennsylvania, Maryland, Virginia, Ohio, and Indiana. According to recent statistics, they have over 500 churches, with more than 50,000 communicants. Their church government is nearly the same as that of other Baptists, except that every brother is allowed to exhort. When they find a man apt to teach, they choose him to be their minister, and ordain him by the laying on of hands, attended with fasting and prayer and giving the right hand of fellowship. They also have deacons and deaconesses. From among the teachers who have been tried they choose bishops. An elder among them is, in general, the first or oldest chosen teacher in a congregation which has no bishop. Their annual meeting in May is attended by the bishops, teachers, and other representatives chosen by the congregations. Important cases brought before these meetings are in general decided by a committee of five of the oldest bishops. They use great plainness of dress and language, like the society of Friends; and, like them, they neither take oaths nor fight. They will not go to law, and until lately the taking of interest on money was not allowed among them. They celebrate the Lord's supper, with accompanying usages of love feasts, the washing of feet, the kiss of charity, and the right hand of fellowship. They anoint the sick with oil for recovery, and use trine immersion, with laying on of hands and prayer, even while the person baptized is in the water. They believe in general redemption, though it is with them not an article of faith.—From the Dunkers, as a sect, must be distinguished the Seventh Day Dunkers, also called the German Seventh Day Baptists. They were established by Conrad Beissel, a native of Germany, who had been educated for the ministry at Halle. When a member of the Dunker society at Mühlbach (Mill Creek), Lancaster co., Pa., he published (1725) a tract to prove that the seventh day, and not the first day, was established by Jehovah for ever as the sabbath. This created some disturbance in the society, and he retired to a hermitage on the banks of the Cocalico. He was discovered and joined by many of the society at Mill Creek, who settled around him in isolated cottages, establishing the first community of Seventh Day Dunkers in 1728. In 1733 a monastic society was established, constituting, with the buildings subsequently erected by the community, the irregular enclosed village of Ephrata. The habit of the Capuchins or white friars was adopted by both the brethren and sisters. Monastic names were given to all who entered the cloister. In 1740 there were 36 single brethren in the cloister and 35 sisters,

and at one time the society, including the members living in the neighborhood, numbered nearly 800. The property which belonged to the society by donation, and the labor of the single brethren and sisters, were common stock; but none were obliged to throw in their own property or give up any of their possessions. They considered celibacy a virtue, but never required it, nor did they take any vows in reference to it. When two wished to be joined in wedlock, they were aided by the society. In the earlier days the idea of a universal restoration existed among them; but it has never been taught as an article of faith. About 1740, 40 years before the present general system of Sunday school instruction was introduced by Robert Raikes, Ludwig Hoecker (Brother Obed) established a Sunday school, which was maintained for upward of 30 years. After 1777 the society at Ephrata began to decline, and of the peculiar features of the early Seventh Day Dunkers few traces are now to be found there. A branch of the society was established in 1758 at the Bermudian creek, in York co., Pa., of which likewise but little is left. Another branch established in 1763 at Bedford still flourishes. Their principal settlement is now at Snowhill, on the Antietam creek, in Franklin co., Pa.

DUNKIRK (Fr. *Dunkerque*), the most northern town of France, in the department of Le Nord, on the strait of Dover, 150 m. N. of Paris; lat. 51° 2' N., lon. 2° 22' E.; pop. in 1806, 33,083. It is a flourishing place, with an active commerce and manufactories of soap, beet-root sugar, leather, and starch, besides iron works and yards for ship building. Its fisheries are important, especially those of cod and herring, and employ about 100 vessels. The town contains many public buildings, including the town hall built in 1642, the church of St. Eloi, a high bell tower, hospitals, prisons, &c. The port is shallow, but the roadstead is good, and the progress of the commerce of the town since it was made a free port in 1826 has been rapid. The entrances in 1870 were 2,917 vessels, of which 872 were steamers, with a tonnage of 494,576.—The origin of Dunkirk is said to have been a chapel founded by St. Eloi in the 7th century, around which a number of fishing huts were erected. Charles V. defended it with a castle, which has been demolished. It was afterward taken by the English, who lost it again in 1558; and in 1559 it was acquired from the French by the Spaniards, whom the duke d'Enghien (afterward the renowned Condé) drove out in 1646. It soon passed again into the hands of Spain, and was once more taken by the French in 1658, who gave it up to Cromwell in accordance with a previous treaty. Charles II. sold it to France in 1662, and Louis XIV. strengthened its defences. The English made an ineffectual attempt to bombard it in 1695. After the peace of Utrecht its fortifications were dismantled and its port was filled up; the former, having

been restored, were again demolished at the peace of Aix-la-Chapelle, and again repaired in 1783. Ten years later it withstood a siege by the duke of York.

DUNKIRK, a village and port of entry of Chautauqua co., New York, 35 m. S. W. of Buffalo; pop. in 1870, 5,231. The Erie and the Lake Shore and Michigan Southern railroads connect it with the principal points both east and west, and the Dunkirk, Alleghany Valley, and Pittsburgh line gives access to the coal and oil regions of Pennsylvania. It is beautifully situated on rising ground on the shore of Lake Erie, and has an excellent harbor, protected by a breakwater. It is a port of refuge during bad weather, and has the advantage of being free from ice earlier than Buffalo. At the western extremity of the bay is a light-house, and at the main channel a beacon. For the year ending June 30, 1872, 31 vessels of 3,595 tons entered from, and 30 of 3,548 tons cleared for foreign ports; 61 vessels of 11,946 tons entered, and 64 of 12,258 tons cleared in the coastwise trade. Dunkirk contains extensive iron works, machine shops of the Erie railway, a glue factory, a brandy distillery, 3 breweries, several oil refineries, manufactories of sashes, doors and blinds, flouring mills, &c. There are 2 banks, 4 hotels, 6 public schools, 2 weekly newspapers, and 10 churches.

DUNKLIN, a S. E. county of Missouri, bordering on Arkansas, bounded W. by the St. Francis river, intersected by Castor river, and having Lake Pemiscot on its E. border; area, about 700 sq. m.; pop. in 1870, 5,982, of whom 166 were colored. The surface is occupied in great part by prairies and swamps, but the soil is generally fertile where not overflowed. Efforts have been made to reclaim the sunken lands, caused by the earthquakes of 1811 and 1812. The chief productions in 1870 were 256,620 bushels of Indian corn, and 5,267 of wheat. There were 1,211 horses, 1,697 milch cows, 3,251 other cattle, 2,622 sheep, and 11,376 swine. Capital, Kennet.

DUNLAP, William, an American painter and author, born in Perth Amboy, N. J., Feb. 19, 1766, died Sept. 28, 1839. In his 17th year he began to paint portraits, and in the summer of 1783 executed one of Washington. The next spring he went to London, and for several years was a pupil of Benjamin West. After his return to America he tried various pursuits, including painting, literary work, theatrical management, &c.; but at the age of 51, after repeated failures, he became permanently a painter. He executed a series of pictures on subjects selected by West and somewhat after his style, which were exhibited in various parts of the United States. He was also one of the founders of the New York academy of design. His "History of the American Theatre," published in 1832, and "Arts of Design in the United States," are standard works of much interest. He also wrote a number of plays, a biography of Charles Brockden Brown, and

a "History of the New Netherlands" (2 vols. 8vo, 1840).

DUN-LE-ROI, a town of France, in the department of Cher, on the Auron, 16 m. S. E. of Bourges; pop. in 1866, 5,454. It was formerly a very important town, and in the 12th century was strongly fortified. There are iron mines and quarries of lithographic stone in the neighborhood.

DUNN, a N. W. county of Wisconsin, intersected by Chippewa and Cedar rivers; area, 850 sq. m.; pop. in 1870, 9,488. The surface is uneven and generally covered with forests. The soil is fertile. The chief productions in 1870 were 204,346 bushels of wheat, 71,574 of Indian corn, 233,404 of oats, 45,069 of potatoes, 12,329 tons of hay, and 209,830 lbs. of butter. There were 1,567 horses, 2,813 milch cows, 4,512 other cattle, 4,182 sheep, and 4,214 swine; 3 flour mills, 1 planing mill, 14 saw mills, and 2 machine shops. Capital, Menomonee.

DUNNING, John, Lord Ashburton, an English lawyer, born in Ashburton, Devonshire, Oct. 18, 1731, died in Exmouth, Aug. 18, 1783. At the age of 19 he went to London, where he was admitted to the bar in 1756. For a long time he obtained little practice; but having been employed in 1762 to draw up the defence of the English merchants against the Dutch East India company, he gained much reputation, which was soon afterward increased by the able manner in which he conducted the case of Wilkes. In 1768 he was elected to parliament, where he sat in the house of commons until he was raised to the peerage in 1782. In 1770 he resigned the office of solicitor general, which he had held for three years. In 1782 he was appointed chancellor of the duchy of Lancaster. He was a strong opponent of the administration during most of the American war; but his reputation is tarnished by his acceptance of a pension of £4,000 after he was raised to the peerage, although he had before objected to the needless and burdensome amount of the pension list, and was very wealthy.

DUNNOTAR, a parish of Kincardineshire, Scotland, on the shore of the North sea, noted for its castle, S. of Stonelaven, now in ruins, which stands on the summit of a perpendicular cliff, 160 ft. high, projecting into the sea, with a deep chasm between it and the mainland; it is approached only by a steep winding path. Sir William Wallace captured it in 1297, at which period it was regarded as one of the strongest places in the kingdom; and the privy council selected it during the wars of the commonwealth as the depository of the regalia of Scotland. It was defended long after every other fortress in Britain had passed into the hands of the protector, but was finally forced to surrender. In 1635 Dunnottar castle became the prison of many of the Covenanters. After the rebellion of 1715 it was dismantled.

DUNOIS, Jean, comte de, a French soldier, born Nov. 23, 1402, died Nov. 28, 1468. The

natural son of Louis, duke of Orleans, brother of Charles VI., he early gained warlike distinction under the appellation of the bastard of Orleans. In 1427, in conjunction with Lahire, he raised the siege of Montargis, then beset by the English. In 1428 he threw himself into Orleans, which was hard pressed by a powerful English army, and upheld the spirit of the troops and citizens until they were relieved in April, 1429, by Joan of Arc. Dunois then became a faithful follower of the heroine, sharing in all her exploits, and particularly in her victory at Patay. In 1432 he recovered Chartres by stratagem; and in 1436 he was one of the generals who marched into Paris, to help the citizens in driving out the English. Several measures adopted by the government of Charles VII. were obnoxious to the nobles, and Dunois in 1440 took part in the rebellion headed by the dauphin, and known as *La Praguerie*; but he soon became reconciled with Charles, and in 1449 received the title of lieutenant general of the king, with command of the principal force for the invasion of Normandy. In less than a year, chiefly by his activity, skill, and prudence, all the cities, towns, and fortresses of Normandy were recovered. In 1451 he led his victorious army into Guienne, stormed the town of Blaye on the Gironde, and within three months completed the conquest of that province, Bordeaux included, which for 300 years had been in the hands of the English kings. Nothing was now left them on the continent except the city of Calais and its vicinity. As a reward for his services Dunois was appointed grand chamberlain to the king. After the accession of Louis XI. he was deprived of some of his offices, and joined in 1465 the rebellious league of the great lords, which assumed the name of "league of the public weal;" but on the conclusion of the peace at Conflans, he was restored to his former offices.

DUNS SCOTUS, John, a scholastic theologian of the 13th century, born probably in Dunse, Berwickshire, Scotland, about 1270, died in Cologne in 1308. He was educated at Oxford, entered the order of St. Francis, and taught theology and philosophy first at Oxford, and then, his fame having spread all over Europe, at Paris. The acumen and subtlety of his reasoning obtained for him the cognomen of *doctor subtilis*. The controversies between Duns and Thomas Aquinas on the relation of human perception to real objects, and on various religious doctrines, were continued for a long time by their respective disciples, who were called Scotists and Thomists. The reasoning of Duns goes to show that the knowledge derived from human conceptions and experience is real and trustworthy, inasmuch as the fundamental ideas upon which human knowledge rests are identical with the absolute substance (*universale*) of existing objects. Reality is the limitation of the absolute substance by individuation, or, in the quaint terminology of Duns, the *hæc*-

ceitas, which might be rendered as the this-and-that-ity. Every existing being consists of substance and privation or limitation, while God is the unlimited absolute substance. The possibilities of limitations or individuations of substance are infinite, and hence follows the existence of accidental chances or occurrences; and hence the free will of individual man and his corresponding responsibility to God. The supernatural knowledge which cannot be derived from real experience is afforded by the Bible, but it is the province of philosophy to show the conformity of the teachings of the Bible with reason. The works of Duns were published by Wadding (12 vols. folio, Lyons, 1639).

DUNSTABLE, a town and parish of Bedfordshire, England, 29 m. N. W. of London, on the Great Northern railway; pop. in 1871, 4,558. The parish church is part of a celebrated priory founded in 1131 by Henry I. The town is the principal seat of the British straw plait manufacture.

DUNSTAN, Saint, an English prelate and statesman, born near Glastonbury, Somersetshire, in 925, died May 19, 988. Under the patronage of his uncle, the archbishop of Canterbury, he passed some years at the court of Athelstan; but the jealousy of courtiers depriving him of the king's favor, he retired to Winchester, and devoted himself to a monastic life. He built a cell against the wall of Glastonbury church, and there passed his time in prayer, fasting, and manual labor, transcribing manuscripts, painting, and fashioning utensils of metal for the use of the altar. About 942 he became abbot of the then ruined monastery of Glastonbury, and received from King Edmund authority to restore it at the royal charge. In the succeeding reign of Edred his power became almost absolute in the national councils. He restored the strictness of ecclesiastical discipline, and brought the Benedictines into England, but on the accession of Edwy was banished from the kingdom. His share in the story of Edwy and Elgiva has brought him into odium with all believers in that much discussed romance, the facts of which are yet unsettled. Edgar recalled the exiled abbot, doubled his honors, made him bishop of the united sees of Worcester and London, and in 959 advanced him to the primacy as archbishop of Canterbury. The prelate ruled both the monarch and the kingdom. He meted out justice with a stern hand, built up the power of the church, placed Benedictines in the livings of the disorderly secular clergy, and forced the king to do a seven years' penance for a sin of licentiousness. On Edgar's death his influence raised Edward to the throne, to the exclusion of a younger son, Ethelred; but on the accession of the latter in 978 his power was broken, and he retired to Canterbury, and there died. Of the writings attributed to him, only the "Concord of Monastic Rule" is known to be authentic. His life, edited by the Rev. J. R. Green, master of the rolls, was published in London in 1872.

DUNSTER, Henry, the first president of Harvard college, inaugurated Aug. 27, 1640, died Feb. 27, 1659. He was president till 1654, when, having become a supporter of the principles of the modern Baptists, he was persuaded to resign his office. He was respected as a modest and pious man, and esteemed an excellent oriental scholar.—See "Life of Dunster," by J. Chaplin (Boston, 1872).

DUNTON, John, an English bookseller and author, born in Graffham, Huntingdonshire, May 4, 1659, died in 1733. He was apprenticed to a bookseller in London, engaged in business for himself, came to New England in March, 1686, with a cargo of books, where he remained about eight months, and after his return embarked again in business, with little success. He conducted a weekly publication called "The Athenian Mercury," resolving all the most nice and curious questions proposed by the inquiring, of which 20 volumes appeared. A selection was made from this in four volumes, called "The Athenian Oracle." He wrote voluminously on religion, ethics, and politics. He gives us, in his "Life and Errors of John Dunton" (London, 1705 and 1818), the "lives and characters of more than 1,000 contemporary divines and other persons of literary eminence," and relates many curious facts in relation to the bookselling business, describing the ministers, booksellers, and other citizens of Boston and Salem. His "Letters from New England," edited by W. H. Whitmore, were published by the Prince society in 1867.

DUODECIMAL, proceeding by twelves, a term properly applied to an arithmetical scale using 11 digits and a cipher, which has been zealously advocated as an improvement upon ordinary decimal arithmetic. Thus if we use *g* for ten, and *q* for eleven, the number 275 may be written 1gg. But the term duodecimal is also given to the system of compound numbers sometimes used by artificers in calculating surfaces and solidities from measures taken in feet and inches. Duodecimals in the second sense are considered by most mathematicians as worthless, and in the first sense as not having sufficient superiority over decimals to counterbalance the inconvenience of making a change.

DU PAGE, a N. E. county of Illinois, drained by the E. and W. branches of Du Page river; area, 340 sq. m.; pop. in 1870, 16,685. It has a level surface, occupied in great part by prairies. The soil is exceedingly fertile. The Chicago and Northwestern and the Chicago, Burlington, and Quincy railroads traverse it, and the Chicago, Rock Island, and Pacific railroad crosses the S. E. corner. The Illinois and Michigan canal passes along the S. E. border. The chief productions in 1870 were 106,789 bushels of wheat, 331,981 of Indian corn, 860,809 of oats, 72,062 of barley, 141,599 of potatoes, 52,430 tons of hay, 58,504 lbs. of cheese, 548,453 of butter, and 153,611 of wool. There were 6,247 horses, 10,888 milch cows,

7,621 other cattle, 26,932 sheep, and 9,253 swine; 15 manufactories of carriages and wagons, 2 of machinery, 8 of saddlery and harness, 2 breweries, and 6 flour mills. Capital, Naperville.

DUPANLOUP, Félix Antoine Philippe, a French prelate, born at St. Félix, Savoy, Jan. 3, 1802, died Oct. 11, 1878. He was brought up in the house of his uncle, a country priest, and in his eighth year was placed at school in Paris. He was ordained priest in 1825, and attached as catechist to the parish of the Assumption. In 1827 he was appointed confessor to the young duke of Bordeaux (now the count de Chambord), in 1828 catechist to the Orleans princes, and in 1830 chaplain to the dauphiness, duchess d'Angoulême, daughter of Louis XVI. In 1834 he opened the course of *conférences* or dogmatic lectures in the cathedral. In 1837 he was appointed superior of the diocesan seminary, and also named vicar general of Paris. Under Archbishop Affre he resigned that office, and in 1849 was nominated to the see of Orleans. In this new career he gave full scope to his plans of Christian education. He opened a school in his own residence, in which he acted as professor, and endeavored in all the establishments under his control to raise the standard of instruction to the highest degree of excellence. At that period a great rivalry existed between the university lyceums or colleges and the schools unauthorized by government. Bishop Dupanloup's efforts and success met with no favor from the administration. It was also at that time that the controversy about the classics arose, growing out of the publication of Abbé Gaume's *Ver rongeur*, in which the use of pagan authors in Christian schools was denounced. The *Univers* and its editor, Veuillot, advocated Gaume's views, and a large portion of the French bishops and clergy coincided in them. Bishop Dupanloup was supported by the remaining members of the episcopate. The pope, however, interfered and made peace between the parties. In 1848 Dupanloup was instrumental in having the first French expeditionary corps sent to the Papal States; and during the whole period of Napoleon's power he was the foremost defender of the temporal independence of the holy see. In 1863, in conjunction with eight other bishops, he issued an address to the French electors, which drew on him the censure of the minister of public worship. Bishop Dupanloup published in November, 1869, a pastoral letter, giving his own private opinion concerning the question of papal infallibility; and a public correspondence on the subject between him and Archbishop Manning excited much attention before the assembling of the council. In Rome, like Archbishop Darboy, he maintained a firm but respectful opposition; and, like him, he was among the first to accept the decree of infallibility when it came. During

the occupation of Orleans by the German troops in 1870 the bishop obtained a mitigation of many of the harsh measures of the military commanders. At the end of the war his people sent him as their representative to the national assembly. There he showed himself favorable to a constitutional monarchy under the reunited house of Bourbon, and advocated a perfect system of education for France, as well as the traditional right of his country to protect the holy see. His principal works are: *Exposition des principales vérités de la foi catholique* (2 vols., 1832); *Méthode générale de catéchisme* (2 vols., 1841); *Eléments de rhétorique sacrée* (1841); *L'Éducation* (3 vols., 1855-'7); *Œuvres choisies* (4 vols., 1861); and *Histoire de N. S. Jésus-Christ* (1872).

DUPATY, Charles Marguerite Jean Baptiste Mercier, a French jurist, born in La Rochelle, May 9, 1746, died in Paris, Sept. 17, 1788. In 1768 he became advocate general at the parliament of Bordeaux, strongly defended the privileges of the French parliaments against the encroachments of the crown, and was imprisoned. He wrote *Réflexions historiques sur le droit criminel*, and *Lettres sur la procédure criminelle de France* (1788), containing views subsequently embodied in the *Code Napoléon*.

DUPERRÉY, Louis Isidor, a French naval officer, born in Paris, Oct. 21, 1786, died Sept. 10, 1865. He entered the navy in 1802, became an ensign in 1811, and was sent in that year to make a hydrographic survey of the coast of Tuscany, which he accomplished in spite of the English cruisers and the hostility of the inhabitants. From 1817 to 1820 he was with Freycinet on his voyage of discovery, in which he had charge of the hydrographic explorations and charts. On his return to France he was promoted to lieutenant, and in 1822 he commanded an expedition for scientific observation in Oceania and on the coast of South America. During a voyage of 32 months he made investigations in hydrography, magnetism, and meteorology, and on the figure of the earth, and collected many thousands of specimens illustrative of zoölogy and botany. He published a large number of scientific treatises and many maps and charts. His most important researches were in terrestrial magnetism, and he determined accurately the positions of the magnetic poles and the figure of the magnetic equator.

DUPERRON, Jacques Davy, a French cardinal, born in St. Lô, Normandy, Nov. 15, 1556, died in Paris, Sept. 5, 1618. He received his education in Switzerland, whither his father, who had given up the practice of medicine to become a Protestant minister, had removed to escape persecution. At the age of 20 he went to Paris, where he abjured Protestantism. Brought to the notice of Henry III., he was appointed reader to the king. Although a layman, he was selected to preach before the king and court; and some of his sermons won him so much praise that he took orders. On

the death of Mary Stuart he was chosen to pronounce her eulogy, in which he spoke so harshly of Queen Elizabeth that the king thought it necessary to disavow his sentiments. Toward the end of the reign of Henry III, he became the confidant of the cardinal de Bourbon, and he has been accused of selling his secrets to Henry IV. He acquired the favor of the latter monarch, who created him in 1591 bishop of Évreux; and he was the chief agent in inducing Henry to abandon the reformed religion. After the taking of Paris he went to Rome and persuaded the pope to remove the interdict which had been placed upon France. In 1600 he was successful in a theological disputation, held before the court at Fontainebleau, over Duplessis-Mornay. In 1604 he was sent to Rome with the title of chargé des affaires of France, and the same year received a cardinal's hat from Clement VIII. He contributed greatly to the election of Leo XI. in 1605, and in the same year to that of Paul V., so that French influence was retained at the papal court. For these services he was made archbishop of Sens and grand almoner to the king. The principal controversial works of Duperron were collected and published in Paris in 1622 (3 vols. folio). He wrote also a number of hymns, ballads, and poetical satires, a poem entitled *L'Ombre de l'amiral de Joyeuse*, and translated into French verse a portion of the *Æneid* and some of the odes of Horace.

DU PETIT-THOUARS, Abel Aubert, a French naval officer, born Aug. 3, 1793, died March 17, 1864. He entered the navy in 1804, and was rapidly promoted. From 1837 to 1839 he was engaged in circumnavigating the globe as commander of the ship *Vénus*. He was afterward made rear admiral and put in command of the fleet in the Pacific. He proposed to his government the establishment of a protectorate over the Society islands; and in 1842, when three French Catholic missionaries were expelled from Tahiti at the instigation of the English missionaries there, he visited that island, demanded reparation, and with the aid of some chiefs placed the island under a French protectorate. In the same year he established a French protectorate over the Marquesas islands; and in 1843, when the English missionary and consul Pritchard persuaded the natives of Tahiti to rise against the French, he drove Pritchard from the island and took possession in the name of France of the whole Society group. At the demand of the English government Du Petit-Thouars was then recalled, and on his return declined the ovations offered him by the opponents of the government. In 1846 he was made vice admiral, and in 1849 elected to the legislative assembly from the department of Maine-et-Loire. He wrote *Voyage autour du monde* (10 vols., with 180 illustrations, Paris, 1840-'49).

DUPIN. I. André Marie Jean Jacques, a French lawyer and politician, born at Varzy, Feb. 1,

1783, died Nov. 10, 1865. He was early distinguished as a learned lawyer and an able speaker. A member of the chamber of deputies in 1815, he opposed the motion to proclaim the son of Napoleon I. emperor after his father's second abdication. The same year, in conjunction with Berryer, he was appointed counsel for Marshal Ney, and, gaining great popularity by his defence, was chosen to defend many political offenders. Among his most famous speeches were those in behalf of Béranger in 1821, and of the *Journal des Débats* on the eve of the revolution of 1830. Having become a member of the chamber of deputies, it was in great part through his exertions in that body that the duke of Orleans secured the crown, and he became a member of Louis Philippe's first cabinet. From 1832 to 1840 he was president of the chamber of deputies, and from 1849 to 1851 of the legislative assembly. He made some show of opposition to the government of Louis Napoleon, was taken unawares by the *coup d'état* of Dec. 2, but declined all participation or responsibility in the parliamentary resistance, and retained his office of attorney general. This, however, he resigned on the publication of the imperial decrees of 1852 confiscating the Orleans property; in 1857 he was reinstated. His writings, mainly on legal subjects, are numerous. His *bons mots* were renowned. **II. Pierre Charles François**, baron, brother of the preceding, born at Varzy, Oct. 6, 1784, died in Paris in January, 1873. He entered the navy as an engineer, and was actively employed in France and the Ionian islands. In 1812 a series of scientific papers attracted the attention of the academy of sciences. During 1814 and 1815 he evinced liberal opinions, but finally adhered to the Bourbons. In 1816 he visited Great Britain, to examine the general resources of the United Kingdom. The results of his travels, continued for more than four years, appeared in his *Voyages dans la Grande Bretagne* (6 vols., Paris, 1820-'24), and his *Force commerciale de la Grande Bretagne* (1826). He caused gratuitous lectures on the application of science to industry, for the benefit of workmen and artisans, to be established in the *conservatoire des arts et métiers* at Paris, and was appointed professor of geometry in that institution. His services were rewarded with a barony. In 1825 and 1826 he instituted a private inquiry into the intellectual and productive resources of France, the results of which he embodied in his *Situation progressive de la France depuis 1814*. In 1828 he was elected to the chamber of deputies. He adhered to the government of Louis Philippe, and was made a peer in 1837; but he nevertheless continued his regular course of public lectures. After the revolution of 1848 he was elected to the constituent and legislative assemblies, acted with the majority, and on the overthrow of the republic became a supporter of the imperial government. He wrote numerous works besides those mentioned,

relating mainly to statistics and political economy. He left a fortune of 10,000,000 francs.

DUPLEIX, Joseph François, marquis, a French soldier and statesman, born at Landrecies, Jan. 1, 1697, died in Paris, Nov. 10, 1764. In 1720 he was sent as an agent to Pondicherry, and in 1730 was appointed director of Chandernagore, and during an administration of ten years acquired an immense fortune and changed that insignificant town into a flourishing city. In 1742 he became governor general of the French possessions in India, and through his energy and executive ability raised them to a degree of prosperity until then unknown. When Labourdonnais captured Madras in 1746, Dupleix refused to accede to the terms of capitulation, kept possession of the city, and sent Labourdonnais to France under a charge of treason. Letters of nobility were conferred upon him the same year. In 1748 he defended Pondicherry against Admiral Boscawen, who attacked it with a fleet of 30 vessels and a land force, and forced him to raise the siege. Peace having been concluded at Aix-la-Chapelle, Dupleix turned his attention toward territorial acquisition by political intrigue. On the death of the Nizam ul-Mulk, sultan of the Deccan, he supported the claim of Mirzapha Jung to the throne, and gained in return large possessions, covering 200 leagues of coast. Other acquisitions followed, which were confirmed by the Great Mogul, and France seemed about to obtain paramount power in India. The English, alarmed by these French successes, increased their forces under Lawrence and Clive. Dupleix submitted a plan of operations designed to open the way to Delhi, but the French company rejected it. He was recalled to France in 1754, and spent the rest of his life in a vain endeavor to obtain from the government some reimbursement of the fortune which he had spent in attempting to establish French supremacy in India.

DUPLESSIS-MORNAY. See **MORNAY**.

DUPLIN, a S. E. county of North Carolina, watered by the north branch of Cape Fear river; area, 670 sq. m.; pop. in 1870, 15,542, of whom 6,766 were colored. It has a level surface; the soil is generally sandy, but there are fertile tracts in the valleys of the streams. The Wilmington and Weldon railroad intersects it. The county contains several pitch-pine forests. The chief productions in 1870 were 291,633 bushels of Indian corn, 135,581 of sweet potatoes, 1,785 bales of cotton, and 155,599 lbs. of rice. There were 1,176 horses, 3,100 milch cows, 5,620 other cattle, 5,698 sheep, and 20,767 swine; 5 flour mills, 2 saw mills, and 7 manufactories of tar and turpentine. Capital, Kenansville.

DUPONCEAU, Peter Stephen, an American lawyer and scholar, born in the Isle of Ré, France, June 3, 1760, died in Philadelphia, April 1, 1844. After studying at colleges in St. Jean d'Angély and Bressuire he went to Paris in 1775, and engaged in translating English books.

He was secretary to Baron Steuben, with whom he came to the United States, and on Feb. 18, 1778, was made captain by brevet in the American service. He accompanied Steuben in all his movements until the close of the campaign of 1779, when the army went into winter quarters in Philadelphia. Here Duponceau was threatened with a pulmonary disease, which for some time prevented him from performing active duty. Toward the close of 1780 he went with Steuben to the south, but renewed ill health forced him to return to Philadelphia early the next summer. Robert R. Livingston, secretary of foreign affairs, gave him a place in his office in October, 1781, which he held until June 4, 1783. He was admitted to the bar in Philadelphia in 1785, and acquired an extensive practice in the courts of Pennsylvania and also in those of the United States, including the supreme court. Jefferson tendered him the office of chief justice of Louisiana, which he declined. In addition to the duties of his profession he devoted much attention to philology. As chairman of the committee of history, moral science, and general literature of the American philosophical society, in 1819 he made a report on the "Structure of the Indian Languages," which at once gave him a high position in this department of knowledge. In May, 1835, he received from the French institute, for a "Memoir on the Indian Languages of North America," the linguistic prize founded by the count de Volney. In 1838 he published "A Dissertation on the Nature and Character of the Chinese System of Writing," in which he held that the written language was lexigraphic, representing sounds and not ideas. He published several essays, letters, and reviews, and expended several thousand dollars, in an unsuccessful effort to introduce into the United States the production and manufacture of silk. His remaining writings comprise an extensive range of subjects; among which are original treatises on points of law; translations from the Latin, German, and French on similar subjects; various treatises on philology; and numerous contributions to American history, including a translation of "A Description of New Sweden," by Thomas Campanian Holm.

DUPONT, Jacques Charles, a French politician, known as Dupont de l'Eure, born in Neubourg, Normandy, Feb. 27, 1767, died in Paris, March 3, 1855. First an attorney at the parliament of Normandy, he became a magistrate, and in 1811 president of the high court of Rouen, which post he held till 1818. He commenced his political career in 1798 in the council of 500, was a member of the legislative corps in 1813, and deputy to the chamber from his native department in 1814. He was constantly reelected from 1817 to 1848, and won the esteem of both friends and opponents. On the revolution of 1830 he accepted the ministry of justice, but left the office after a few months to resume his seat among the lib-

eral opposition in the chamber of deputies. In February, 1848, he was elected president of the provisional government, but old age interfered with his activity. He was elected to the constituent assembly, and in 1849 retired to private life.

DU PONT, Samuel Francis, an American naval officer, grandson of Du Pont de Nemours, born at Bergen Point, N. J., Sept. 27, 1803, died in Philadelphia, June 23, 1865. He entered the navy as midshipman Dec. 19, 1815, was promoted lieutenant in 1826, and commander in 1843. Ordered in 1845 to the Pacific in command of the frigate Congress, Commodore Stockton's flag ship, he reached Monterey (1846) just as the Mexican war began. Transferred at once to the command of the sloop of war Cyane, he did much active and gallant service on the California coast. At the capture of Mazatlan under Commodore Shubrick, in November, 1847, he headed the line of boats which entered the main harbor, and in February, 1848, landed at San José with a force of sailors and marines, marched three miles under fire, and defeated a large body of Mexicans, relieving Lieut. Heywood's little garrison, closely besieged and about to surrender. He became captain in 1856, and was sent on special duty to China in 1857, in command of the steam frigate Minnesota, returning in 1859, after a cruise to Japan, India, and Arabia. Placed in command of the Philadelphia navy yard Jan. 1, 1861, he rendered important services at the breaking out of the civil war. He was appointed flag officer in the following September, and assigned to the command of the South Atlantic blockading squadron. On Nov. 7 he attacked and captured, after a severe battle of four hours, the forts at Hilton Head and Bay Point, defending Port Royal harbor, S. C. His squadron, led by the flag ship Wabash, steamed thrice in an elliptic course between the forts, firing at each in turn; this skilful disposition saved his wooden ships from material injury. In August, 1862, he became rear admiral upon the creation of this rank in the United States navy. On April 7, 1863, Admiral Du Pont made a very gallant though necessarily unsuccessful attack with ironclads upon Fort Sumter. He was relieved from his command in the following July. He died of disease originated by his cruise in the East Indies. During the intervals of more than 25 years of sea service, Admiral Du Pont was constantly employed on important professional duties. He was the author of a treatise on the use of floating batteries for coast defence, which has been republished and highly commended in England.

DUPONT DE L'ÉTANG, Pierre, count, a French general, born at Chabannais, Angoumois, July 14, 1765, died Feb. 16, 1838. Appointed brigadier general in 1793 and general of division in 1797, he joined Bonaparte on the 18th Brumaire, contributed to the victory of Marengo, and at the close of 1800 defeated an over-

whelming Austrian force at Pozzolo on the banks of the Mincio. He won new laurels in 1805 and 1806 during the campaigns in Austria and Prussia, and in 1807, by a bold movement against the Russian imperial guard, decided the victory of Friedland. Sent to Spain in command of the army which was to conquer Andalusia, he was successful at first, but was surrounded in the Sierra Morena by a Spanish army under Castaños, and surrendered with his whole force, July 22, 1808. For this act, known as the capitulation of Baylen, Dupont was by imperial decree degraded from his rank and sent to the fort of Joux in the Jura. The fall of the empire restored him to liberty, and his supposed hatred of the emperor led to his appointment as minister of war, and the cancelling of all the proceedings against him; but he was soon dismissed from that office. After the second restoration he was appointed member of the privy council. His native department elected him several times to the chamber of deputies. He published pamphlets on the recruiting system and the campaign of Austria, and observations on Montgaillard's *Histoire de France*.

DU PONT DE NEMOURS, Pierre Samuel, a French economist and statesman, born in Paris, Dec. 14, 1739, died near Wilmington, Delaware, Aug. 6, 1817. Two pamphlets on the finances, published at the age of 23, gained him the acquaintance and regard of the celebrated Quesnay. Of all the economists, Du Pont did most to give currency to the doctrines of the school. His work, *De l'exportation et de l'importation des grains* (1764), caused Turgot to seek his acquaintance, and they became intimate friends. During the next eight years Du Pont published among other books *Physiocratie*, an analysis of Quesnay's system (1768), and *Le commerce de la compagnie des Indes* (1769); he also edited the *Journal de l'agriculture, du commerce et des finances*, and from 1768 the *Éphémérides du citoyen*, the organ of the school. Upon the suppression of the latter in 1772, Du Pont, who had received various titles and decorations from foreign princes, was invited to Poland by King Stanislas Augustus, and made secretary of the council of public education, and governor of his nephew, Prince Adam Czartoryski. When Turgot became comptroller general (1774), Du Pont was recalled to France, and took part in all the reform measures of that minister, particularly in financial matters, most of the principles upon which the French treasury is now conducted being derived from the measures which Du Pont attempted to carry out at that time. He also prepared the scheme for provincial administration recommended to the king by Turgot. Upon Turgot's disgrace (1776), Du Pont was banished from Paris, and busied himself with agricultural and literary pursuits, reappearing in print with a translation of a part of Ariosto's *Orlando furioso* (1781), and after Turgot's death with a memoir of his friend (1782). Re-

called to public life by Vergennes, he negotiated with the English envoy, Dr. James Hutton, the treaty of 1782, which recognized the independence of the United States, and later the commercial treaty of 1786 with Great Britain. For these services he was made councillor of state and inspector general of agriculture and commerce. In 1787 he was secretary of the assembly of notables, and instigated and drew up the famous memorial upon abuses which Calonne laid before it. On the fall of this minister the personal interference of Louis XVI. saved him from another banishment. Member of the states general from Nemours in 1789, and later of the constituent assembly, of which he was twice president, he was a steadfast advocate of constitutional monarchy and opposed the extreme revolutionists. For his opposition to the issue of assignats he was mobbed on leaving the assembly, and his life was with difficulty saved by the national guard. Upon the dissolution of the constituent assembly he exerted himself to resist the excesses of the revolution, but was marked for destruction after the 10th of August, 1792, when he went armed to the palace with his son to defend the king. He succeeded in escaping to the country after being hidden in the observatory for several weeks by the astronomer Lalande, and while in concealment wrote his *Philosophie de l'univers*. Finally arrested and imprisoned in La Force, the death of Robespierre saved him from the guillotine. As soon as he was liberated he renewed his struggle against the Jacobins, and helped to organize the unsuccessful revolt of the sections. He was elected member of the council of ancients from Loiret, and became president of the council on the success of the reactionary party in the elections of 1797. When the republicans broke up the councils with Augereau's troops, Du Pont's house and property were destroyed by the mob, and he narrowly escaped transportation to Cayenne. In 1799 he emigrated with his family to America, where he was received with much consideration. Returning to France in 1802, he declined the various appointments which Napoleon offered him, but as a friend of both countries was instrumental in bringing about the treaty of 1803 by which Louisiana was sold to the United States. During the empire he published a work on the bank of France (1806), and *Mémoires sur différents sujets d'histoire naturelle* (1807), and wrote many papers for the institute of France and other learned societies of which he was a member. His plan of national education for the United States, prepared at the request of Jefferson, and published in 1812, though not carried out in the country for which it was intended, has been partly adopted in France. Upon the fall of Napoleon (1814), Du Pont was secretary of the provisional government, and at the restoration became councillor of state. On Napoleon's return from Elba he rejoined his sons in America, where he died

two years afterward. In addition to numerous pamphlets on financial and political subjects, Du Pont also published *De l'origine et des progrès d'une science nouvelle* (1767); *De l'administration des chemins* (1767); *Objections et réponses sur le commerce des grains et des farines* (1769); *Observations sur les effets de la liberté du commerce des grains* (1770); *Table synoptique des principes de l'économie politique* (1775); *Idées sur les secours à donner aux pauvres malades dans une grande ville* (1786); *Notice sur la vie de M. Poivre* (1786); *Analyse historique de la législation des grains depuis 1692* (1789).

DUPORT, James, an English scholar, born in Cambridge in 1606, died July 17, 1679. He received his early education at Westminster school. In 1622 he entered Trinity college, Cambridge, and devoted himself especially to the study of Greek. He graduated in 1627, and was immediately elected fellow. In 1630 he was ordained to the ministry, in 1639 became regius professor of Greek in the university, and in 1641 was made prebendary of Lincoln and archdeacon of Stow. During the commonwealth he was one of the few who were not expelled from the university; but in 1654 he was displaced from his professorship, although he continued his labors as fellow and tutor. On the restoration Duport was appointed king's chaplain. He was made D. D. in 1660, dean of Peterborough in 1664, master of Magdalen college in 1668, and vice chancellor of the university in 1669. Among his numerous publications are a Greek poetical version of the book of Job (1637), also of Proverbs, Ecclesiastes, and Song of Solomon, with Latin translations (1646); *Gnomologia Homeri* (1660); translation into Greek of the "Book of Common Prayer" (1665); the Psalms of David in Greek hexameters (1666); and "Lectures on Theophrastus's Characters" (1712).

DUPRAT, Antoine, a French cardinal and statesman, born at Issoire, Jan. 17, 1463, died July 8, 1535. He was successively bailiff of Montferrand, government advocate at Toulouse, member of the council of state, and president of the parliament of Paris. On the accession of Francis I., in 1515, he became chancellor and prime minister. In a conference with the pope at Bologna he conceded the abolition of the pragmatic sanction, and secured for the king the power of appointing the French bishops. His wife dying in 1516, he took orders, and was made archbishop of Sens, and finally a cardinal. The great object of his administration was to centralize all power in the hands of the king. To this end he sought to lessen the consequence of the constable duke de Bourbon by setting up the adverse claim of the queen mother Louise of Savoy to his great inheritance, thus driving him into an alliance with Charles V., and securing at his death in 1527 the confiscation of all his possessions in favor of Francis I. For the same purpose Duprat attacked the powers and privileges

of the parliament, and succeeded in reducing it to a mere judicial body, and freeing the king from all control. He was noted for his cupidity, intolerance, and subservience to the king.

DUPRÉ, Jules. See p. 802.

DUPREZ. I. **Gilbert Louis**, a French tenor singer, born in Paris, Dec. 6, 1806. He received his musical education at the conservatory, and was admitted to the singing school of Choron. In 1825 he was engaged at the Odéon, and married two years later Mlle. Dupéron, a vocalist. After a successful tour through the principal cities of Europe, he obtained in 1837 an engagement at the Opéra in Paris, and continued there till 1849, when he retired from the stage. He was a professor at the conservatory from 1842 to 1850. He produced some of his own compositions on the stage, but they failed. The principal ones are *Joanita* (1852), *La lettre au bon Dieu*, *Jeanne d'Arc* (1865), and an oratorio entitled *Le jugement dernier* (1868). He has also written a work entitled *L'art du chant*. II. **Caroline Van den Heuvel**, a French soprano, daughter of the preceding, born in Florence in 1832. She was one of the principal singers at the Opéra Comique from 1852 to 1856, when she married M. Van den Heuvel. She sang subsequently at the Théâtre Lyrique, and became in 1860 a member of the Opéra. She reappeared recently at the Opéra Comique, but remained only for a short time, and retired from the stage. III. **Edouard**, brother of Gilbert, was for some time a member of the troupe of the Opéra Comique, and has written several librettos for his brother and the composer Verdi. *Le bal masqué*, *Rigoletto*, and *La traviata* are among the best known of his writings.

DUPUIS, Charles François, a French scholar and philosopher, born at Trie-le-Château, Normandy, in October, 1742, died near Dijon, Sept. 29, 1809. He was the son of a country schoolmaster, and through La Rochefoucauld was enabled to complete a course of collegiate studies at Paris. In 1766 he was made professor of rhetoric at the Lisieux college, and in 1787 of Latin eloquence in the collège de France. He had a thorough knowledge of astronomy and ancient mythology, and spent the best part of his life in elaborating a theory tracing to the former the origin of all religions. His theory, first presented in several papers in the *Journal des Savants*, was more fully expounded in a 4to volume printed in 1781, under the title of *Mémoires sur l'origine des constellations et sur l'explication de la fable par l'astronomie*, and 14 years later was developed in *L'origine de tous les cultes, ou la religion universelle* (3 vols. 4to, Paris, 1795). In 1796 he published an abridgment, which has been frequently reprinted. While a deputy to the convention, Dupuis acted with the moderate party; he was a member of the council of 500, and a candidate for the directorship. On the establishment of the empire he returned to private life, and in 1806 published his *Dissertation sur*

le zodiaque de Tentyra ou Denderah, the complement of his great work.

DUPUYTREN, Guillaume, a French surgeon, born at Pierre-Buffière, Limousin, Oct. 6, 1777, died in Paris, Feb. 8, 1835. At the age of 12 he was placed in the college of La Marche at Paris, where he engaged in literary studies, but was rebellious, abandoned Latin for the sciences, and became enthusiastic only after undertaking the study of medicine. At 18 he was appointed one of the six assistant dissectors in the newly established schools of health; and in 1801 he succeeded Duméril without competition as curator of the anatomical department. He displayed unprecedented skill and activity in dissection, and became successively surgeon of the second class in the Hôtel-Dieu, inspector general of the university, professor of medical practice, and in 1815 surgeon-in-chief of the Hôtel-Dieu. Having now absolute power in the oldest and wealthiest hospital of France, he regularly passed five hours in the morning in performing operations in the presence of more than 400 students. After the fatal attack on the duke de Berry, in 1820, Dupuytren was called to the Tuileries for consultation, and three years later he was made first surgeon to the king. His proud, silent, and capricious character was the object of innumerable epigrams and calumnies. His health failed in 1833, and he went to Italy, but soon returned and resumed his lectures. He died after much suffering, which excited rather his curiosity than complaints or disquietude, and left a part of his fortune for the foundation of a chair of pathological anatomy in the faculty of medicine in Paris, and of a museum which bears his name. His principal works have been collected in an edition entitled *Leçons orales*. He simplified many surgical operations, and made some valuable innovations.

DUQUESNE, Abraham, a French naval officer, born in Dieppe in 1610, died Feb. 2, 1688. He was educated in his native town, early entered the naval service, and gained distinction in several encounters with the Spaniards, especially in 1637 off the isles of Lérins, in 1641 off Tarragona, and in 1643 off Cape de Gatte. Hostilities being suspended, he entered the Swedish service in the latter year as vice admiral, and in 1644 completely defeated the Danish fleet commanded by King Christian IV. in person. He soon afterward returned to France, and in 1650 fitted out a squadron at his own expense, with which he prevented the Spaniards from entering Bordeaux, then the stronghold of the rebellious princes. After the peace of 1659 he served against the pirates on the coast of Africa. He was made naval lieutenant general in 1667, and in the war with Holland was twice engaged against De Ruyter in 1676, in the Mediterranean. In both engagements the Dutch were defeated, and in the latter they lost their commander. A few weeks later Duquesne destroyed the remains of their fleet, and secured the naval supremacy of France.

Louis XIV. bestowed upon him the estate of Du Bouchet with the title of marquis. He was ordered to clear the Mediterranean of the Barbary pirates; defeated the Tripolitans off the island of Scio in 1681; attempted in 1682 the bombardment of Algiers, which stormy weather obliged him to abandon; resumed it the next year, and forced the dey to sue for peace. The first condition imposed by Duquesne was the liberation of a considerable number of Christian slaves. In 1684 he led a successful expedition against Genoa, and soon after retired to his native city. Duquesne was a firm Protestant, and after the revocation of the edict of Nantes he alone of all the French Protestants was permitted to remain in France and retain his rank and honors. His four sons, two of whom, Henri and Abraham, had served under him with great distinction, were compelled to leave their country; but their father obtained from them a promise, which they rigidly kept, never to serve against France.—See *Duquesne et la marine de son temps*, by Henri Plon (Paris, 1872).

DUQUESNE, Fort. See PRITSBURGH.

DURAM, or Durão, Jozé de Santa Rita, a Brazilian poet, born near Mariana, province of Minas Geraes, in 1737, died in Lisbon in 1783. He became an Augustinian monk after graduating as doctor of divinity at the university of Coimbra, and was professor of theology there from 1771 till his death. His chief work is a poem founded on the story of the Galician adventurer Diogo Alvarez Correa, surnamed Caramurú, the legendary hero of Bahia, which was published at Lisbon in 1781, under the title of *Caramurú, poema epico do descobrimento da Bahia* (French version, Paris, 1829). The poem ranks as a national epic in Brazil. Duram wrote other poems and prose works.

DURAND, Alice. See p. 802.

DURAND, Asher Brown, an American painter and engraver, born at Jefferson, Morris co., N. J., Aug. 21, 1796. His art education commenced in the shop of his father, a skilful watchmaker, where he acquired some knowledge of the elementary processes of engraving. His first attempts at the production of prints were made with plates hammered out of copper coins, and with tools of his own construction, his models being the cards inserted in the cases of watches. In 1812 he was apprenticed to Peter Maverick, an engraver of New York, with whom after the expiration of his term in 1817 he entered into partnership. His engraving of Trumbull's "Declaration of Independence," which cost him three years' labor, brought him into general notice, and thenceforth for many years his graver was in constant demand. His "Musidora" and "Ariadne," the latter engraved from Vanderlyn's picture, are among the most creditable specimens of the art produced in this country. In 1835, having for the previous ten years been a regular contributor of portraits, small figure pieces, or landscapes in oil, to the exhibi-

tions of the national academy of design, he finally abandoned engraving as a profession. For several years he painted portraits, landscapes, and occasionally figure pieces, but subsequently gave his exclusive attention to landscape painting. His pictures are pleasing in color and tone, and those representing woodland scenes are conceived with poetic feeling, and present fine studies of trees and foliage. His collected works, many of which are of large dimensions, and some of which have been engraved, would convey an unusually correct idea of American scenery under many different aspects. In 1854 he painted a portrait of William C. Bryant, the engraving from which, published in 1858, received its finishing touches from his hand. Mr. Durand was for many years president of the national academy of design, succeeding Prof. Morse.—His son, JOHN DURAND, conducted for several years a monthly publication called "The Crayon," devoted especially to the interests of the fine arts. He is also the translator of a number of Taine's works, including "Ideal in Art" (1868); "Italy: Rome and Naples" (1868); "Italy: Florence and Venice" (1869); "Philosophy of Art: Art in the Netherlands" (1870); and "Art in Greece" (1871).

DURANGO. I. A N. state of Mexico, bounded N. by Chihuahua, E. by Coahuila, S. E. by Zacatecas, S. by Jalisco, and W. by Sinaloa; area, 42,643 sq. m.; pop. in 1868, 185,077. The surface in the W. portion is broken by the Sierra Madre; in the E. are many large plains, with very fertile soil; the N. W. portion is a dreary waste, inhabited by savages. The principal rivers are the Rio de las Palmas, the Nazas, the Mezquital, and the Zunal, all rising in the Sierra Madre. The climate is cold on the mountains, hot on the W. slopes, and temperate in the remainder of the state. Agriculture is neglected, because of the frequent incursions of Indians from the north, by which the herds that once constituted the riches of the inhabitants have been almost entirely destroyed. On western slopes and in sheltered valleys the sugar cane and other tropical plants and fruits are produced; flax and potatoes grow wild in the Sierra Madre; and large quantities of cotton are raised in the valleys. Wheat and other cereals and vegetables of the temperate zone yield large crops in the central districts. Gold is abundant near Santa Maria del Oro, where large quantities of it were once extracted; near the capital are an iron mountain and inexhaustible mines; copper and lead are plentiful; and argentiferous beds are numerous in the Sierra Madre. There are some schools and colleges; and the government is making efforts for the general diffusion of education. Under the Spaniards the state was called New Biscay. II. A city, capital of the state, near the foot of the S. E. slope of the Sierra Madre, in lat. 24° 4' N., lon. 104° 20' W., 480 m. N. N. W. of Mexico; pop. in 1868, 12,449. The city, which is nearly 7,000

ft. above the sea, was founded about 1560 by Alonso Pacheco as a military station, and soon after was made an episcopal see. Its original name was Guadiana, and it is now sometimes called Victoria. The streets are regular, but the houses are generally poor. The only buildings worthy of note are the government house, the cathedral, ten parish churches, and a spacious hospital. There are three small prisons, a penitentiary, a state prison, a coliseum, an arena for bull fights, and a cock pit whose main building presents a sumptuous appearance. There are public gardens, three public squares, and nine public baths. Thermal springs supply water, which runs in open streams through the streets. The inhabitants are remarkable for cleanliness. The climate is temperate, and the thermometer seldom rises above 78° F. There are manufactures of cotton and woollen goods, leather, iron, glass, and tobacco. The mint from 1811 to 1845 coined \$27,962,668. There is an institute in which jurisprudence, languages, and the sciences are taught, a seminary, and several minor schools.

DURANTE, Francesco, an Italian composer, born at Frattamaggiore, near Naples, about 1690, died Aug. 13, 1755. His parents were poor, and he was educated at a charity school. He was instructed in music by Searlatti, and devoted himself to teaching and composition. In 1742, on the departure of Porpora to Germany, Durante was made master of the conservatory of Loretto. His works are 62 in number; mainly ecclesiastical. He was not fertile in melodic ideas, but his harmonies were fine in invention and pure in style. Robert Franz has given to some of this composer's works full modern orchestral accompaniment, and they have been recently revived both in Europe and in this country.

DURAZZO (anc. *Epidamnus* or *Dyrrhachium*; Turkish, *Dratch*; Slav. *Durtz*), a town of Albania, Turkey, on the E. coast of the Adriatic, 50 m. S. by W. of Scutari; pop. about 10,000. It is strongly fortified, has a safe and commodious harbor, and carries on a considerable trade in corn, tobacco, oil, wood, and British manufactured goods, which are imported from Trieste. It is the seat of a Roman Catholic archbishop. (See *DYRRHACHIUM*.)

DURBIN, John Price, D. D., an American clergyman, born in Bourbon co., Ky., in 1800, died in New York, Oct. 17, 1876. At the age of 14 he was apprenticed to a cabinet maker, and a few years later entered the ministry. He studied at Miami university while preaching at Hamilton, Ohio, graduated at Cincinnati college, and soon afterward was appointed professor of languages in Augusta college, Ky. In 1831 he was elected chaplain of the United States senate, and in 1832 became editor of the "Christian Advocate and Journal." In 1834 he was elected president of Dickinson college at Carlisle, Pa., and during his incumbency made an extensive tour of observation in Europe and the East. As member of the

general conference of 1844 he was a prominent actor in the great contest on slavery which divided the church. Retiring from his office in 1845, he was pastor of churches in Philadelphia, and was also presiding elder of the Philadelphia district. He was secretary of the missionary society from 1850 to 1872, when he retired in consequence of physical infirmity. To his labors is largely due the establishment of missions in India, Bulgaria, western and northern Europe, and many parts of the United States, and the reinvigoration of those in China and elsewhere; while through his plans the annual contributions have increased from \$100,000 to \$600,000. In 1867 he again visited Europe in the interest of missions. Besides numerous contributions to periodical literature, Dr. Durbin published "Observations in Europe, principally in France and Great Britain" (2 vols. 12mo, New York, 1844), and "Observations in Egypt, Palestine, Syria, and Asia Minor" (2 vols. 12mo, 1845).

DÜREN, a town of Rhenish Prussia, on the river Roer, 18 m. E. of Aix-la-Chapelle; pop. in 1871, 12,850. It has an asylum for the blind, and considerable manufactures of cloth, carpets, steel and iron ware, and paper. Under the Carolingians Düren was a town of importance, and councils were held there in 761 and 779. Charles V. captured and burned the town in 1543.

DÜRER, Albrecht, or Albert, a German painter and engraver, born in Nuremberg, May 20, 1471, died there, April 6, 1528. His father was a Hungarian goldsmith settled in that town. When 15 years old he was placed with Michael Wohlgenuth, the leading painter of Nuremberg. With him he remained four years, after which he travelled through Germany and the Low Countries, employing several years in the study not merely of his own art but of the most important collateral branches. He returned to Nuremberg in 1494, and soon after contracted a marriage which, according to the received tradition, was very unhappy. His earliest well authenticated picture bears the date of 1498, and is a portrait of himself. A similar portrait, dated 1500, and now in the Pinakothek at Munich, represents a man in the prime of life, standing in a dignified attitude, his hair falling over his shoulders. In his last portrait, a woodcut of the year 1527, the face is marked by lines of care, and the head is shorn of the flowing locks in which the artist was wont to take a complacent pride. In 1498 appeared his first great series of woodcuts, illustrating the Revelation of St. John; a work of singular power, in which the artist's imagination, however, is controlled by the fantastic element which then pervaded German art. At the close of 1505, by the aid of his friend Wilibald Pirckheimer, Dürer made a journey to northern Italy, and remained a considerable time at Venice, Bologna, and other places; but so firmly was he grounded in his peculiar style, that the graceful productions of the

Italian schools had no influence upon him. From the time of his return to Nuremberg, in 1507, ensued a period of singular artistic activity, and among the great works which he then produced are the paintings of the "Martyrdom of the 10,000 Saints," at Vienna; the "Assumption of the Virgin," burned at Munich; the "Adoration of the Trinity," at Vienna; "Christ taken from the Cross," at Nuremberg; and the "Adoration of the Magi," at Florence; the woodcut series of the "Greater Passion" and "Lesser Passion," the "Life of the Virgin," and the "Triumphal Arch of the Emperor Maximilian;" the copperplate engravings of "The Knight, Death, and the Devil," "Melancholy," and "St. Jerome;" and portraits of his friends Pirkheimer, Melancthon, and Erasmus. The print of "The Knight, Death, and the Devil" suggested to Fonqué his tale of "Sintram and his Companions." It is supposed that the woodcuts which pass under Dürer's name were cut by engravers from his drawings on the wood. He was very prosperous, and enjoyed the friendship of many of the most learned men of the day. The people of his native town delighted to honor him, and for many years he was one of its chief burghers. The emperors Maximilian I. and Charles V. successively appointed him court painter, and the chief cities of Germany were emulous for the possession of his works. In 1520 Dürer made a second journey to the Netherlands, and under the influence of this visit his subsequent works exhibit a soberer feeling and a refinement of his exuberant fancy. In 1526 were produced his two pictures containing life-size figures of the apostles John and Peter, and Mark and Paul, which were among his last, as they are generally esteemed his grandest works, and which he presented to the council of his native city. At this time Dürer had embraced the doctrines of the reformation, and these paintings are supposed to have conveyed the artist's exhortation to his countrymen to stand firm in the new faith.—As an engraver and a painter Dürer was one of the most remarkable men of an age prolific of great artists. In painting, he raised German art to an excellence which passed away with him; he found engraving in its infancy, and carried it to a perfection never since surpassed; he cultivated architecture and sculpture, and wrote valuable treatises on geometry and fortification, with a purity of style evincing a profound knowledge of the German language. He was the first German artist who taught the rules of perspective, and insisted on the study of anatomy. He rejected the classic ideal which Raphael and his contemporaries had so successfully realized. Hence his strange attitudes, his fanciful draperies, his over-elaborate costumes and accessories, and the Gothic element which seems to pervade all his works. His wonderful creations, nevertheless, surprised and delighted the Italians. Raphael had the highest admiration of his genius, and

sent him a drawing executed by his own hand. The memory of Dürer is held in great veneration by the people of Nuremberg, who preserve his house with religious care. On the 300th anniversary of his birth the corner stone of a monument to his memory was laid there; and in May, 1840, the work was completed by the addition of a bronze statue of the artist by Rauch.—See Charles Narrey, *Albert Durer à Venise et dans les Pays-Bas* (illustrated, Paris, 1866); A. von Eye, *Albert Dürer* (Nördlingen, 1867); Mrs. Heaton, "History of the Life of Albert Dürer of Nuremberg" (London, 1869); William B. Scott, "Life and Works of Albert Dürer" (London, 1869). A collection of his engravings has been reproduced under the care of Kaulbach (14 numbers, Nuremberg, 1857-'61).

DURESS (law Lat. *durities*; Fr. *duresse*), in law, the constraint by means of which a person is forced to act against his will. Duress is either of imprisonment, which must be either without lawful process, or by abuse of lawful process for an unlawful purpose; or it is *per minas*, where the compulsion is through fear of personal injury. Duress is admitted as a defence to a criminal charge only under several important restrictions. 1. It is not in general a justification for a felony, but only for the lesser offences called misdemeanor. 2. There must be apprehension of danger such as might reasonably be entertained by a person of ordinary courage; though in determining this, the age, sex, health, temperament, &c., of the person are important elements to be considered. 3. The injury threatened must be such as to endanger life or limb, and not of personal chastisement merely, or of injury to reputation or property. 4. Command by a father or master is not a justification to a child or servant for the commission of a crime; yet the wife was by the common law held to be in the power of the husband so far that what was done by her in his presence was deemed to be done under duress, and was a justification even for capital offences, except treason and murder. This was upon the legal presumption that if the husband was present the wife acted by his coercion; still greater would be her claim to exemption if actual coercion could be proved. There was, however, a singular inconsistency in not allowing the same excuse on the ground of coercion, actual or presumed, in respect to mere misdemeanors. It has been plausibly suggested that the reason of this anomaly was that the wife was not entitled to the benefit of clergy, while the husband was so entitled; and as he could therefore escape from punishment for certain offences, but the wife was subject to the penalty, the law humanely interposed and relieved her from all legal liability in cases where husband and wife were jointly chargeable, but in which a claim to benefit of clergy was allowed, and this privilege did not apply to misdemeanors, nor to murder or treason.—As a defence to contracts,

duress is admitted with much greater liberality. In general any contract entered into under duress of imprisonment, and in order to obtain relief therefrom, may be avoided for the compulsion; a reasonable fear of unlawful injury to one's person or reputation, or of destruction to one's property, may also constitute a valid defence; and in some cases it has been held that fear of unlawful imprisonment is legal duress, and that even detention of goods may be sufficient to avoid one's contract where he has no other speedy means than the giving of the contract for obtaining possession of them.

DURFEE, Job, an American author and jurist, born in Tiverton, R. I., Sept. 20, 1790, died there, July 26, 1847. He graduated at Brown university in 1813, studied law, and in 1820 was chosen representative in congress, where he served during two terms. For several terms he was a member of the state legislature, and in 1828 speaker of the house of representatives. In 1833 he was appointed associate justice of the supreme court of Rhode Island; and in 1835 he became chief justice, an office which he held until his death. In 1832 he published a poem in nine cantos, entitled "What Cheer," an account of the departure of Roger Williams from Salem, his adventures in the wilderness, and the settlement of Rhode Island. He also wrote a philosophical treatise called "Panidea," to prove the pervading influence and presence of God throughout nature. His works were collected and published with a memoir by his son (8vo, Providence, 1849).

DURFEEY, Thomas, a humorous English poet, born in Exeter about 1650, died in London, Feb. 26, 1723. He was of a French Protestant family which had fled from La Rochelle in 1628, when it was besieged by Louis XIII., and had settled in Exeter. Abandoning law for literature, he wrote ballads, sonnets, irregular odes, and more than 30 pieces for the theatre. The last were very successful; but as they are written in the licentious style prevalent after the restoration, they are not now represented upon the stage. He used to sing his own songs, and counted among his patrons King Charles II., Queen Anne, and even William III. His best known work, besides his plays, was a collection of songs and ballads, partly by himself, entitled "Wit and Mirth, or Pills to purge Melancholy" (6 vols. 12mo, London, 1719-'20).

DURHAM. I. A N. E. county of England, bordering on the North sea and on the counties of Northumberland, Cumberland, Westmoreland, and York, bounded N. partly by the river Tyne and S. by the Tees; area, 973 sq. m.; pop. in 1871, 685,045. Its general aspect is mountainous, particularly in the western part, where it is traversed by branches of a range of hills which has been called the English Apennines. From these several ridges shoot off, and some of them, projecting as far as the sea, terminate in tall cliffs and headlands. The rivers Tyne, Tees, and Wear are

navigable for a considerable part of their course, and have important towns and tolerable harbors at their mouths. The valley of the Tees, particularly near its estuary, has much alluvial soil, under careful cultivation, or devoted to pasturage. Here the famous Durham cattle are most extensively reared. Scarcely less celebrated are the Teesdale sheep, more highly prized than any other English breed. In the table lands of the western part, where cultivation is not attempted, are rich veins of lead; and east of this district is the Newcastle coal region, the most extensive in Great Britain. Iron, firestone, and millstone are also found in large quantities. Limestone, some of it peculiarly excellent, underlies a large portion of the county. Numerous railways and navigable rivers facilitate transportation. The principal manufactures are iron work, pottery, glass, coal, tar, salt, linen, and woollen. With the exception of the groves attached to country seats of the nobility, and some portions of the vale of Derwent, there is little woodland. Durham was formerly a county palatine, the bishop possessing regal rights within its borders; but his jurisdiction was transferred to the crown in the reign of William IV. The county consists politically of two divisions, each of which sends two members to the house of commons. II. An episcopal city and parliamentary borough, capital of the county, built on seven small hills, and nearly encompassed by the river Wear, which is here crossed by several bridges, 60 m. N. N. W. of York; pop. in 1871, 14,406. The river banks are skirted by plantations, hanging gardens, and beautiful public walks, beyond which the houses rise one above another, until they are crowned by the grand cathedral and an ancient Norman castle, on the summit of a rocky eminence. The division between the cathedral and the river has many elegant residences. The old town, N. of the castle, contains most of the shops, and a market place with a fountain. Among the public buildings and institutions are a town hall in the Tudor baronial style, a number of schools, an infirmary, hospitals, reading rooms, libraries, assembly rooms, a theatre, seven parish churches, various chapels, a school of art, and a university. A college was founded here as early as 1290 by the prior and convent of Durham, which was afterward enlarged, and under Henry VIII. was transferred with all its endowments to the dean and chapter. The present university was opened in 1833, and incorporated in 1837. It has two colleges, University and Bishop Hatfield's hall, instituted in 1846 for divinity students. The cathedral was founded in 1093. Its length, including the western porch, is 507 ft., its greatest breadth 200 ft., and it has a central tower 214 ft. high, besides two low towers, once surmounted by spires. The predominant style is early Norman, but in the various additions are specimens of the different styles which had prevailed in England up

to the close of the 14th century. The Galilee chapel at its W. end, built by Bishop Pudsey in the 12th century, contains the remains of the Venerable Bede; those of St. Cuthbert, patron of the church, rest in the chapel of the nine altars. The old church of St. Nicholas, partly repaired and partly rebuilt in 1858, is one of the finest specimens of modern church architecture in the north of England. Opposite

the cathedral stands the castle, founded by William the Conqueror for the purpose of maintaining the royal authority in the adjoining districts and protecting the country from the inroads of the Scots. Many additions have been made to it, and it is doubtful whether any part of the original keep, except the foundation, now remains. For many years it was the residence of the bishop, but of late it has

Durham Cathedral, north side.

been given up to the uses of the university. The see of Durham was long the richest in England, and for the three years ending with 1831 the average annual net revenue of the bishop was £19,066; but in 1836 his income was fixed at £8,000, the surplus being added to the incomes of poorer bishops.—The opening of collieries and construction of railways has given a powerful impetus to the trade and population of Durham. It has manufactures of carpeting and mustard. By the Great North of England railway it is connected with Newcastle-upon-Tyne, and by the Newcastle and Tyne railway with the W. coast. In the vicinity are Neville's Cross, erected by Lord Neville in commemoration of the defeat of David II. of Scotland in 1346, and the site of a Roman fortress, called the Maiden castle.

DURHAM, John George Lambton, earl of, an English statesman, born at Lambton Castle, county of Durham, April 12, 1792, died at Cowes, Isle of Wight, July 28, 1840. He was educated at Eton, served a short time in a regiment of hussars, and was returned to parliament in 1813, where he was one of the most liberal members of the whig party. During the reform excitement of 1819 he advocated the cause of the people, not only in parliament, but in public meetings. He was one of the

defenders of Queen Caroline, and in 1821 promulgated a scheme of parliamentary reform, which, though then unsuccessful, was embodied in the reform act ten years later. In 1826 his feeble health compelled him to relax his labors; he passed a year in Naples, and on his return was raised to the peerage as Baron Durham. He was lord privy seal in Earl Grey's ministry of 1830, and was one of the four who prepared the reform bill of the ensuing year, and the duty of defending this and the succeeding bills in the house of lords devolved upon him. In 1833 he retired from the cabinet, and was made an earl. In 1836-'7 he was ambassador to Russia. In 1838 he was sent with extraordinary powers as governor general to Canada, then in a state of rebellion; but returned in December, 1839, in consequence of a disagreement with the home ministry. He prepared an elaborate report on Canadian affairs, setting forth liberal principles of colonial government, and proposing the union of the two provinces.

DÜRINGSFELD, Ida von, a German authoress, born at Militsch, Lower Silesia, Nov. 12, 1815, died in Canstatt, Oct. 12, 1876. She early studied modern languages and literature, and commenced her literary career at the age of 15 by writing for a Breslau journal. Her first works

were *Gedichte* (1835), and a series of romances, *Der Stern von Andalusien* (1838), issued under the name of "Thekla." In 1841 she published at Breslau her *Schloss Goczyn*. This and other publications previous to her marriage with Baron Otto von Reinsberg, in 1845, appeared anonymously, but subsequently her writings were published under her family name. Among her romances of "high life" are *Skizzen aus der vornehmen Welt* (1842-'5), *Graf Chala* (1845), *Esther* (1854), *Clotilde* (1855), *Milena* (1863), and *Die Literaten* (1863). Her historical romances are *Margaretha von Valois und ihre Zeit* (1847), and *Antonio Foscarini* (1850). Among her poetical publications are collections entitled *Für Dich* (1851), and *Amimone* (1852). In the *Böhmische Rosen* (1851) and *Lieder aus Toscana* (1855) she translated the folk songs of the Czechs and Tuscans. As the result of her travels appeared a series of sketches, among which is *Aus Dalmatien* (3 vols., Prague, 1855-'7). During a residence in Belgium she collected the materials for a work entitled *Von der Schelde bis zur Maas* (3 vols., Leipsic, 1861), in which she illustrated the intellectual progress of the Flemish people since 1830. She also wrote a work on proverbs, *Das Sprichwort als Kosmopolit* (3 vols., Leipsic, 1863).

DURIO, a fruit tree of the Indian archipelago, of the family *sterculiaceae*, the only known species of its genus (*D. zibethinus*). It attains a height of 80 ft., and in general appearance is like the elm. The leaves are entire, oblong, rounded at the base, and taper to a long point; their color is silvery red. The flowers are yellowish green, and grow in little clusters on the main branches. The fruit, known as the durian, is sometimes round, sometimes oval, 9 or 10 inches in longest diameter. It has a thick hard rind, covered with sharp strong prickles; it is divided into five cells, each containing from one to four seeds as large as pigeons' eggs; and a luscious cream-colored pulp which envelopes these is the part that is eaten. It has a delicious flavor, though a repulsive odor, and commands the highest price of any fruit in the Indian markets. The seeds are often roasted and eaten; they taste like chestnuts. The durio is cultivated in Ceylon; each tree yields about 200 durians in a season.

DÜRKHEIM, a town of Rhenish Bavaria, on the Isenach, 15 m. N. W. of Spire; pop. in 1871, 5,572. The principal trade is in corn and wine; there are glass works and a paper mill. In the vicinity are the salt works of Philippsall, with three saline springs. The place is chiefly remarkable as a resort of invalids who take the grape cure. In the environs are the ruins of the abbey of Limburg and of the castle of Hartenburg. On the summit of the Kastanienberg is a rampart known as the *Heidenmauer* or pagan's wall (the scene of Cooper's novel of this name), said to have been a Roman camp. Turenne here defeated the imperialists in 1674.

DURLACH, a town of Baden, at the foot of the Thurmberg, and on the right bank of the Pfalz, 4 m. E. of Carlsruhe; pop. in 1871, 6,327. It contains a fine castle, a parish church with an excellent organ, a quaint old town hall, and a statue of the margrave Charles II. in the market place. Linens, tobacco, chicory, and fruits are produced here. It was the residence of the margraves of Baden-Durlach from 1565 to 1771, when that line became extinct.

DUROC, Gérard Christophe Michel, duke of Friuli, a French general, born at Pont-à-Mousson, near Nancy, Oct. 25, 1772, killed near Markersdorf, Saxony, May 22, 1813. He served in the first wars of the revolution as adjutant of Gen. L'Espinasse, joined the army of Italy in 1796, became brigadier general in 1797, took part in the Egyptian campaign, and after Napoleon's return to France and the 18th Brumaire, in which he was a chief actor, he was made lieutenant general and governor of the Tuileries. He was employed on diplomatic missions to Stockholm, Copenhagen, St. Petersburg, Berlin, and Dresden; took part in the battle of Ansterlitz as successor of Oudinot; and accompanied Napoleon in the campaigns of 1806 and 1807. In 1809 he was with the emperor in Austria, and negotiated the truce of Znaym. In 1812 he was in the Russian campaign, always enthusiastically devoted to the cause of Napoleon, of whom he was a great favorite. After the battle of Bautzen, while escorting the emperor to an elevation adjoining the battle ground, he was struck by a cannon shot. The farm house in which he died was purchased by Napoleon, who caused a monument to be erected there to Duroc's memory. His remains were removed in 1845 to the church of the Invalides in Paris.

DURUY, Victor, a French historian, born in Paris, Sept. 11, 1811. He was successively professor of history at colleges in Rheims and Paris, was made doctor of letters in 1853, and afterward inspector of the academy of Paris, inspector general of secondary instruction, and professor of history at the polytechnic school. In 1863 he became minister of public instruction, and in this position introduced many improvements and innovations, some of which excited great opposition. He retired in 1869, and became a senator. He is the author of numerous very popular works on ancient, mediæval, and modern geography and history, especially Greek, Roman, and French, several of which are included in a collection entitled *L'Histoire universelle*, edited by him. He also wrote important reports on the progress of literature and science as shown in the universal exposition of 1867.

DUSSEK, John Louis, a Bohemian composer and pianist, born at Czaslau, Feb. 9, 1761, died in Paris, March 20, 1812. His father, John Joseph Dussek, was organist and choir master at Czaslau, and he had learned to play the piano with much facility at the age of five.

He became a choir boy at the convent of Iglau, and there pursued the study of music. He afterward attended the university of Prague, receiving the degree of bachelor of philosophy, and commenced his professional life in Belgium as organist of the church of St. Rombaut at Meehlin. He resided also at Amsterdam and the Hague. In 1783 he went to Hamburg to consult Emanuel Bach, and receiving encouragement from him he took up his temporary residence at Berlin, and there excited much attention by his pianoforte playing. He went in turn during three succeeding years to Paris, to Milan, and to London, where he married and became a music publisher. In this he failed, and to avoid his creditors fled to Hamburg. After various wanderings he at last about 1807 settled in Paris, where he became concert master to Prince Talleyrand. He published 76 compositions. Those among them which he regarded as the best are known by the opus numbers 9, 10, 14, and 35. As a pianist he achieved a great distinction, and was among the first to make the piano popular at concerts. The instruments of this class were in his day very weak and imperfect, but by his broad style and great dexterity he overcame these disadvantages.

DÜSSELDORF, a city of Rhenish Prussia, capital of a district of the same name, at the confluence of the Düssel and the Rhine, 20 m. N. N. W. of Cologne; pop. in 1871, 69,351. Area of the district, 2,112 sq. m.; pop. 1,328,065. The city is a great focus of railway and steamboat communication, and much of the transit trade of the Rhine is carried on by its merchants. There are many carriage, tapestry, cotton, tobacco, and mustard manufactories, tanneries, and dyeing establishments. In 1288 Düsseldorf became a municipality. In modern times it has been successively under the dominion of Brandenburg and Neuburg, under French and Bavarian rule, and was for some time the capital of the duchy of Berg, until in 1815 it passed with the whole duchy under the sway of Prussia. It is divided into four sections, the Altstadt, the Karlstadt, the Friedrichstadt, and the Neustadt. The last was laid out by the elector palatine John William, whose statue adorns the market square and the palace yard. The Karlstadt derives its name from the elector Charles Theodore, its founder, who established in 1767 the academy of painting. The town possesses many delightful

parks, and the Hofgarten is one of the finest in Prussia. New and beautiful streets have been laid out within the last 25 years. The prominent public buildings are the former electoral palace, now the art academy, the town hall, the cabinet of antiquities and that of scientific instruments, the tribunals, the observatory, and the churches of St. Lambert and St. Andrew. Both churches contain monuments of the ancient sovereign princes of Düsseldorf. There are numerous charitable and literary associations, an academy of commerce, a good theatre, and a library of 50,000 volumes. The celebrated picture gallery, established here in 1690, was transferred to Munich in 1805. The collection of 14,500 drawings by the old masters, among which are several by Michel Angelo, Raphael, Giulio Romano, Domenichino, and Titian, and of 24,000 engravings and casts, which formed part of the same gallery, still remains in Düsseldorf. Art has flourished here

Düsseldorf.

more than in any other German town, especially since 1822, when Frederick William III. renovated the building of the academy, and when Cornelius, Schadow, and other artists of genius founded the Düsseldorf school of painters. The art union for Rhenish Prussia and Westphalia was founded here in 1828. The engravers' establishment of the royal academy of Schulgen-Bettendorf was removed from Bonn to Düsseldorf in 1837. In June, July, and August there is an exhibition of pictures by living artists. Besides the academy of painting, there is a school for painters and one for architects. A monument of Cornelius for this city was designed in 1874.

DUTCH LANGUAGE AND LITERATURE. See NETHERLANDS.

DUTCHESS, a S. E. county of New York, bounded W. by the Hudson river, and E. by Connecticut; area, 816 sq. m.; pop. in 1870, 74,041. The surface is uneven and in many

parts hilly. Fishkill river and Wappinger's creek supply water power, which is employed in a number of mills. Much of the soil is best adapted to grazing, but the cultivated portions are carefully improved and very fertile. Limestone, slate, marble, iron, and lead are the most important minerals. It has great facilities for communication by means of the Hudson river, the Hudson River and Harlem railroads, which intersect it, and the Dutchess and Columbia and the Poughkeepsie and Eastern railroads. The chief productions in 1870 were 87,921 bushels of wheat, 174,194 of rye, 509,608 of Indian corn, 700,100 of oats, 403,687 of potatoes, 136,554 tons of hay, 1,232,252 lbs. of butter, and 135,275 of wool. There were 10,397 horses, 27,209 milch cows, 16,732 other cattle, 35,422 sheep, and 13,540 swine; 19 iron works, 7 woollen mills, 1 cloth-printing establishment, 32 flour mills, 7 breweries, 7 tanneries, 7 currying establishments, 9 manufactories of agricultural implements, 7 of bricks, 6 of carpets, 27 of carriages and wagons, 11 of barrels and casks, 3 of cotton goods, 1 of dye stuffs, 2 of hats and caps, 1 of rubber goods, 5 of machinery, 10 of sashes, doors, and blinds, 20 of tin, copper, and sheet-iron ware, 20 of tobacco and cigars, and many others; in all there were 866 manufacturing establishments, with an aggregate capital of \$6,604,866. Capital, Poughkeepsie.

DUTROCHET, René Joachim Henri, a French physiologist, born at Néon, Poitou, Nov. 14, 1776, died in Paris, Feb. 4, 1847. His family was rich and noble; but its property having been confiscated during the revolution, he studied medicine in Paris, and served in the army as physician in the Spanish campaigns of 1808-9. The rest of his life he passed chiefly on his estate in Touraine. He published researches upon the formation of the eggs in birds and fowls, the gradual unfolding of the allantois in the incubated egg, the increase of the young as the albumen diminishes, the structure and growth of feathers, the envelopes of the fœtus of mammalia and of the human fœtus, and the growth of vegetables and insects. His most remarkable achievement was the discovery of endosmosis in 1828, and in that year he published *Recherches sur l'endosmose et l'exosmose*. His principal writings were collected in 1837 under the title of *Mémoires pour servir à l'histoire anatomique et physiologique des végétaux et des animaux*; and in 1842 he published *Recherches physiques sur la force épiplœique*.

DUTTEAH, a town of India, capital of a state of the same name in the district of Bundelcund, lat. 25° 40' N., lon. 78° 31' E.; pop. over 40,000. It is nearly midway on the route from Agra to Saugor, 115 m. S. S. E. of the former. The town is in a narrow valley, between low rocky hills, and is surrounded by a wall 30 ft. high. The streets are narrow and crooked; but many of the houses, belonging to landholders of the neighborhood, are large and substantial. The

raja's palace and pleasure ground of 10 acres are surrounded by a high wall. In the grounds is a reservoir with a fine fountain, around which eight sculptured elephants spout water.

DUUMVIRS, among the ancient Romans, two officers appointed temporarily and for a particular purpose. They were therefore of various sorts, and were specially named from the nature of their functions. The *duumviri juri dicundo* were the highest magistrates of colonies and towns, where they had the rank of consuls at Rome. The *duumviri navales* had charge of the construction and equipping, and sometimes of the command of fleets. The *duumviri quinquennales* were the censors of municipal towns. The *duumviri sacrorum* had originally the charge of the Sibylline books. The *duumviri ludorum* in the Byzantine empire were functionaries elected for one year to the office of exhibiting games at their own expense to the people.

DUVAL. I. A N. E. county of Florida, bordering on the Atlantic, bounded N. by Nassau river and intersected by the St. John's; area, 430 sq. m.; pop. in 1870, 11,921, of whom 6,780 were colored. The surface is generally level. The Jacksonville, Pensacola, and Mobile, and the Florida railroads pass through it. The chief productions in 1870 were 32,737 bushels of Indian corn, 35,273 of sweet potatoes, and 17 hhds. of sugar. The total value of live stock was \$155,517. There were 2 brick yards, 10 saw mills, 1 ship yard, 2 manufactories of tin, copper, and sheet-iron ware, 1 of tar and turpentine, and 3 of jewelry. Capital, Jacksonville. **II.** A S. W. county of Texas, watered by affluents of the Rio Nueces, and by several streams that flow into the gulf of Mexico; area, 1,650 sq. m.; pop. in 1870, 1,083, of whom 3 were colored. Water and timber are scarce. The grass is good, and stock raising may be successfully pursued, but only along the streams is the land suitable for agriculture. In 1870 the total value of farm products was \$26,522, including 110,950 lbs. of wool. There were 2,622 horses, 4,472 cattle, and 34,325 sheep. Capital, Jacksonville.

DUVAL, Valentin Jameray, a French scholar, born in Champagne in 1695, died in Vienna in September, 1775. He was of humble parentage, and was employed in his boyhood as a herdsman, but found time for study. He accumulated about 200 books and a few maps, and one day was found in the midst of them by Leopold of Lorraine, who placed him under the instruction of the Jesuits of Pont-à-Mousson. Here he made rapid progress, and Duke Leopold took him to Paris in 1718, subsequently appointing him librarian and professor of history at the noblemen's academy of Lunéville. When Duke Francis Stephen, ceding Lorraine, became grand duke of Tuscany, he accompanied him as librarian to Florence. Here he resided for nearly ten years, until called to preside over the collection of coins and medals at Vienna, Francis Stephen having married Maria

Theresa and become emperor of Germany. His complete works, chiefly on numismatics, with a memoir, were published at Basel (with the imprint of St. Petersburg) in 1784, in 2 vols. 8vo, and at Paris in 1785, in 3 vols. 18mo.

DUVERGIER DE HAURANNE. I. Jean, a French theologian, born in Bayonne in 1581, died in Paris, Oct. 11, 1643. He was educated in theology at Louvain, where Jansenius was at the same time a student, with whom he formed an intimate friendship, and who accompanied him to Bayonne, but soon returned. Duvergier was appointed canon of Bayonne, and afterward of Poitiers and abbot of St. Cyran. His rigor and zeal becoming known, he was invited to Paris, where he made numerous disciples in all classes of society. He refused several bishoprics. His Jansenist principles brought upon him the enmity of the Jesuits, and in 1638 he was imprisoned at Vincennes by order of Richelieu, after whose death he was released, but did not long survive. His most celebrated writings are those which he directed against the Jesuit Garasse. Pascal, Arnauld, and Nicole were his disciples. **II. Prosper,** a politician and author, descended from a brother of the preceding, born in Rouen, Aug. 3, 1798, died Aug. 16, 1877. He was long associated as a journalist with Guizot, Rémusat, and Rossi. In 1831 he was chosen to the chamber of deputies from Sancerre, and at first gave his support to the government of Louis Philippe, but became one of the prominent champions of reform. After the revolution of 1848 he represented the department of Cher in the constituent assembly, and in November, 1850, became a member of the legislative assembly. After the *coup d'état* of 1851 he was imprisoned, and then banished until August, 1852. His principal work is the *Histoire du gouvernement parlementaire en France* (7 vols., Paris, 1857-'65). He was elected a member of the academy in 1870.

DUVERNOY, Georges Louis, a French naturalist, born in Montbéliard, Aug. 6, 1777, died in Paris, March 1, 1855. He pursued his studies at Stuttgart, Strasburg, and Paris, and in 1802 was invited by Cuvier, to whom he was related, to assist in editing his treatise on comparative anatomy. With the aid of the notes and counsels of his master, he prepared the last three volumes of this work, embracing the organs of digestion, respiration, circulation, generation, and the secretions. For 20 years he practised medicine in Montbéliard, publishing only a few writings on fossils. In 1827 he was elected professor of natural history at Strasburg, where during ten years he published a variety of papers on anatomical subjects; and after the death of Cuvier he was engaged in arranging his papers for publication. In 1837 he was elected professor of natural history in the collège de France, and in 1850 was transferred to the chair of comparative anatomy. His numerous works have furnished important materials to anatomists and zoologists.

DUVEYRIER. I. Honoré Nicolas Marie, baron, a French jurist and politician, born at Pignans, Provence, Dec. 6, 1753, died in May, 1839. He received a military education, but devoted himself to the law, and became a distinguished barrister. Louis XVI. sent him three days previous to his flight to Varennes on a mission to the prince de Condé, but he was detained for some time as a prisoner by the Austrians. Though elected on his return a member of the commune of Paris, he was put in prison at the instigation of Robespierre. After his release he was employed abroad as a commissioner for the supply of the French armies. In 1796 he resumed his practice in Paris, and was afterward general administrator of finance in Rome, acquiring a large fortune. He eventually became president of the court of appeal at Montpellier. His heroic-tragical comedy *La cour plénière* made a great sensation at the time of its publication (1775), and its authorship was long ascribed to Beaumarchais. His other principal work, in which his son Charles participated, is *L'Histoire des premiers électeurs de Paris en 1789*.

II. Anne Honoré Joseph, known as a dramatic author under the pseudonyme Mélesville, son of the preceding, born in Paris, Nov. 13, 1788, died there in 1865. He was originally a lawyer and magistrate, but after the restoration devoted himself to the drama. He wrote more than 300 plays, chiefly in conjunction with Scribe, and *Le chevalier de St. Georges* with Roger de Beauvoir. Among the best known comic operas of which he wrote the text is *Zampa*. **III. Charles,** brother of the preceding, born in Paris, April 12, 1803, died there, Nov. 10, 1866. He was an active St. Simonian, and organized branches of that sect in England and Belgium, wrote for Michel Chevalier's *Globe*, and was sentenced to one year's imprisonment for having published in that journal an article entitled *De la femme*. Subsequently he wrote plays with his brother and other authors. In 1855 he composed with Scribe the text of Verdi's "Sicilian Vespers." **IV. Henri,** son of the preceding, an explorer of Africa, born in Paris, Feb. 28, 1840. He completed his education in Germany, became acquainted with the traveller Barth, qualified himself for explorations by special studies in Paris, was in Africa in 1857 and 1859, and published *Exploration du Sahara* (2 vols., Paris, 1864 *et seq.*), besides contributions to periodicals and to the French and German geographical societies. He served in the French army in 1871, and was for some time a prisoner of war in the German fortress of Neisse.

DUXBURY, a town of Plymouth co., Massachusetts, on the N. shore of Plymouth harbor, at the terminus of the Duxbury and Cohasset extension of the South Shore railroad, 27 m. S. S. E. of Boston; pop. in 1870, 2,341. The N. E. boundary of the harbor is a peninsula, about 6 m. long, called the Garnet. Near its extremity are two fixed lights. Duxbury is the terminus of the Atlantic telegraphic cable

laid in 1869 from Brest, France, via St. Pierre. In the S. part of the town is Standish or Captain's hill, 180 ft. high, commanding a fine view of the sea. It was the residence of Miles Standish, to whose memory a monument was erected in 1872. The inhabitants are chiefly engaged in commerce, fishing, and ship building. There are 10 schools, including a high school and an academy, and several churches.

DUYCKINCK. I. Evert Augustus, an American author, born in New York, Nov. 23, 1816, died there, Aug. 13, 1878. He was a son of Evert Duyckinck, long a leading bookseller and publisher. He graduated at Columbia college in 1835. In 1840 he commenced, with Cornelius Mathews, a monthly periodical entitled "Arcturus," which was continued till 1842. In 1847 he commenced the "Literary World," a weekly critical journal; he withdrew from the editorship with the publication of the 12th number, but resumed it on the appearance of the 88th, in connection with his younger brother George; and the periodical remained under their joint management until its discontinuance at the close of 1853. In 1856 the two brothers completed the "Cyclopædia of American Literature" (2 vols. large 8vo), to which the elder brother added a supplement in 1865. He also published "The Wit and Wisdom of Sydney Smith," with a memoir (1856); "Poems relating to the American Revolution," with memoirs (1865); "History of the War for the Union" (3 vols., 1861-'5); "National Portrait Gallery of Eminent Americans" (2 vols., 1866); "History of the World from the Earliest Period to the Present Time" (1870); "Memorials of John Allan" (1864); and "Memorials of Francis L. Hawks" (1871). He also contributed largely to periodical literature. **II. George Long**, brother of the preceding, born in New York, Oct. 17, 1823, died there, March 30, 1863. He graduated at the university of New York in 1843. Besides his share in the editorial conduct of the "Literary World" and in the preparation of the "Cyclopædia of American Literature," he published "George Herbert of Bemerton" (1858), and lives of Bishop Thomas Ken (1859), Jeremy Taylor (1860), and Latimer (1861).

DUYSE, Prudens van, a Flemish poet, born at Dendermonde about 1805, died in Ghent, Nov. 13, 1859. He was professor of national history in the athênæum of Ghent, and archivist of the city, and contributed to the preservation of the Flemish dialect by his poems. He published *Vaterlandsche poëzij* (1839), *Het klaverblad* (1848), and *Dichtbespiegeling* (1849). He was also the author of several essays on the history and literature of the Netherlands.

DWARACA, Dwarka, or **Jigat**, a town of Guzerat, Hindostan, on the coast, near the western extremity of the peninsula of Cattywar, 270 m. W. of Baroda. It is fabled to have been the residence of Krishna, and contains several pagodas, the principal of which is the most celebrated temple of Krishna in India, with

a spire 140 ft. high, consisting of a series of pyramids. It is annually resorted to by 15,000 pilgrims. It contains about 2,500 houses, and has an important trade in chalk.

DWARF (Sax. *dwerg*, *dweorg*), an animal or a plant that does not attain the ordinary size of its species. A degree of dwarfishness may be the general result of natural causes, as of excessive cold, since both plants and animals diminish in stature toward the poles; or it may be produced by artificial means. The Chinese have the art of dwarfing trees by diverting the growth from the foliage to the flowers and fruit. The ancients are said to have produced artificial dwarfs of the human race, who were highly esteemed by the Roman matrons for servants. During the middle ages dwarfs shared with fools the favor of courts and of the nobility, and a salary for the king's dwarf was not abolished in France till the reign of Louis XIV. A race of dwarfs, perhaps the pigmies of the ancients, has been said to exist in the interior of Africa; and Du Chaillu in his "Country of the Dwarfs" gives a curious account of a dwarfish race which he found in equatorial Africa. Symmetrical dwarfs are rare and remarkable phenomena. One of the most noted of those whose history is certain was the Polish gentleman, Count Borowlaski or Boruslawski (1739-1837). At 1 year of age he was 14 inches high; at 6, 17 in.; at 10, 21 in.; at 15, 25 in.; at 20, 28 in.; at 25, 35 in., which was nearly his greatest height. He early displayed wit and grace, and was taken into the family of the countess Humiecka, with whom he frequented the Prussian court. At the age of 40 he married, became a father, and, after giving concerts in the principal cities of Germany, visited England. In London he published his memoirs (8vo, 1788), and he afterward lived in elegant retirement in Durham. In contrast with him was the favorite dwarf of the ex-king Stanislas of Poland, commonly called Bébé (1741-'64). He was a native of Lorraine, and at 5 years of age was 22 in. high; at 15, 29 in.; and at his death, 33 in. His diminutive figure was well formed and justly proportioned till after the age of puberty, when his spine curved and he became decrepit. He was once visited by the count Borowlaski, and, having noticed the superiority of the latter in manners and intelligence, watched for an opportunity and attempted to throw his visitor into the fire. The Dutch dwarf, Wybrand Lolkes, born in 1730, possessed mechanical taste and skill, had success as a watchmaker, and when 60 years of age was 27 in. high and weighed 56 lbs. Mme. Teresia, called the Corsican fairy from the place of her birth (1743), was remarkable for physical symmetry and beauty, and mental vivacity. She spoke several languages, was charming in conversation, and when exhibited in London in 1773 was 34 in. high and weighed 26 lbs. Jeffery Hudson (1619-'82) was the favorite dwarf of Charles I. of England. He was a native of

Oakhams, and about the age of 7 years, when 18 in. high, was taken into the service of the duke of Buckingham. From the age of 7 to 30 he grew no taller, but afterward shot up to 3 ft. 9 in. He was served up in a pie at a royal entertainment, from which he suddenly sprang forth in full armor. Sir William Davenant wrote a poem called "Jeffreidos" on a battle between him and a turkey cock, when a woman rescued him from his furious antagonist. The courtiers teased him about the story till he challenged a young gentleman, Mr. Crofts, who had affronted him. That gentleman appeared at the rendezvous armed only with a squirt, which so enraged the dwarf that a real duel ensued. The combatants were on horseback, and at the first fire Jeffery shot his antagonist dead. He was afterward taken prisoner by a Turkish rover, and was for a time a slave in Barbary. At the beginning of the civil war he was made captain in the royal army, but he closed his life in prison, into which he had been cast shortly before his death on suspicion of being privy to the popish plot. Charles I. of England attended the marriage of Richard Gibson and Anne Shepherd, each of whom measured 3 ft. 10 in. Waller wrote a poem on the occasion, and Sir Peter Lely painted the couple at full length. Gibson rose to celebrity as a painter. In 1710 Peter, czar of Russia, celebrated a marriage of dwarfs with great parade. All the dwarf men and women within 200 miles, numbering about 70, were ordered to repair to the capital. He supplied carriages for them, and so managed that one horse should be seen galloping into the city with 12 or more of them. All the furniture and other preparations were on a miniature scale. Gen. Tom Thumb (Charles S. Stratton), the celebrated American dwarf, was born in Bridgeport, Conn., in 1837, and at the age of 5 years was not 2 ft. in height and weighed less than 16 lbs.; and he had grown but very little for three or four years. He had fine talents, and was remarkable for agility and symmetry, while his lively sense of the ludicrous gave him excellent success in performances suited to his character. In 1842 he was exhibited in New York, his age being announced as 11 years. He visited England in 1844, was several times exhibited to the queen and court at Buckingham palace, gave levees, and was invited to parties of the nobility. In Paris he gained applause as an actor. He returned to the United States in 1847, and was exhibited in the principal cities of the United States and in Havana. He again visited England in 1857. In 1863 he married Lavinia Warren (born at Middleboro', Mass., Oct. 31, 1842), also a dwarf, who had been placed on exhibition in 1862. Since their marriage they have travelled extensively in the United States and Europe.

DWIGHT, Edmund, an American merchant, born in Springfield, Mass. Nov. 28, 1780, died in Boston, April 1, 1849. He graduated at Yale college in 1799, and studied law. In 1815

he founded in Boston a mercantile house which afterward built up the manufacturing villages of Chicopee Falls, Cabotville, and Holyoke. He was the first to propose the establishment of normal schools in Massachusetts, to secure which, in 1838, he pledged \$10,000 provided the state would appropriate a like sum, which was accepted by the legislature.

DWIGHT, John Sullivan, an American author and critic, born in Boston, Mass., May 13, 1813. He graduated at Harvard college in 1832, and studied theology in the divinity school at Cambridge. In 1840 he was ordained as pastor of the Unitarian congregation in Northampton, Mass., where he remained but a short time, relinquishing the ministry to devote himself to literature, and especially to musical criticism. In 1838 he published, in Ripley's "Specimens of Foreign Standard Literature," "Translations of Select Minor Poems from the German of Goethe and Schiller, with Notes." His translations are distinguished for their graceful diction, and not less for their conscientious adherence to their originals, and especially for their musical rhythm. Subsequently he delivered lectures in many cities upon Bach, Beethoven, Handel, Mozart, and other great composers, which did much to awaken popular attention to what is called classical music, and to develop the love and appreciation of it in this country. He also contributed many articles to the "Christian Examiner," the "Dial," the "Harbinger," and other periodicals, and musical critiques of a far higher character and range of thought than were then common to the newspapers of the day. He was one of the founders of the Brook Farm association, where he resided for nearly seven years. In April, 1852, he commenced in Boston the publication of "Dwight's Journal of Music," an independent journal of criticism of music, art, and literature, which is still in existence.

DWIGHT, I. Timothy, an American divine and scholar, born in Northampton, Mass., May 14, 1752, died in New Haven, Conn., Jan. 11, 1817. From his earliest years, under the training of his mother, a daughter of Jonathan Edwards, he gave indications of a thirst for knowledge and great facility of learning. He is said to have been able at the age of four to read the Bible correctly and fluently. He graduated at Yale college in 1769, and took charge of a grammar school in New Haven, where he remained for two years. From 1771 to 1777 he was a tutor in Yale college; in the latter year, when on account of the revolutionary troubles the students of the college were dispersed, he went with his class to Wethersfield, where he remained till autumn, and in the mean time was licensed to preach by an association in Hampshire co., Mass. Soon after this he was appointed chaplain to a brigade of the division under Gen. Putnam, and joined the army at West Point, where he remained for more than a year, not only laboring for the spiritual interests of the soldiers,

but heightening their enthusiasm by addresses and by patriotic songs, the principal of which was entitled "Columbia." By the death of his father in 1778 the support of his mother with 12 children devolving on him, the oldest of her sons, he resigned his chaplaincy and removed with his family to Northampton. Here he worked with his own hands on the farm, supplied some neighboring church on the Sabbath, established and sustained a school for both sexes, represented the town in 1781 and 1786 in the state legislature, and would have been chosen to the continental congress, but declined the intended honor in order to devote himself to the work of the ministry. In 1783 he was ordained pastor of the Congregational church at Greenfield Hill, Fairfield, Conn.; but as his salary was insufficient for his support, he established an academy, to which he devoted six hours of each day. In 1787 he received the degree of D. D. from the college of New Jersey, and in 1810 that of LL. D. from Harvard college. On the death of Dr. Stiles he was chosen his successor as president of Yale college, was inaugurated in September, 1795, and held the office until his death. In addition to its appropriate duties he performed a vast amount of labor belonging to other departments. He was in reality professor of belles-lettres, oratory, and theology, teaching a class preparing for the ministry, and preaching in the college chapel twice every Sunday; in the discharge of which latter duty he prepared and delivered in a series of discourses his well known system of theology. During several years he spent his vacations in travelling through New England and New York, making extensive notes and critical observations on the manners of the time, which were afterward published and have a permanent value. Dr. Dwight was a man of commanding presence, of dignified but affable manners, of striking conversational powers, of superior intellectual faculties, untiring in his industry and research, of great system and wonderful memory; as a teacher, remarkable for his skill and success; as a writer, interesting and sensible; and as a preacher, sound, strong, impressive, and at times highly eloquent. The literary labors of Dr. Dwight were very great, and his publications numerous, including dissertations, poems, and occasional sermons, issued during his life, and since his death; "Theology Explained and Defended," with a memoir (5 vols., 1818), often reprinted in this country and in England; "Travels in New England and New York" (4 vols., 1822); "Sermons on Miscellaneous Subjects" (2 vols., 1828). Among his poetical works are "The Conquest of Canaan" (1785), an epic poem in 11 books, finished in 1774, and "Greenfield Hill" (1794). **II. Sereno Edwards**, an American clergyman, son of the preceding, born at Greenfield Hill, Fairfield, Conn., May 18, 1786, died in Philadelphia, Nov. 30, 1850. He graduated at Yale college in 1803, and was tutor there from 1806 to 1810,

during which time he studied law in New Haven, and was admitted to the bar in the latter year. He practised till 1815, when he gave up law for theology, and in October of the year following was licensed as a preacher. He was chaplain of the United States senate for the session of 1816-'17, and in September of the latter year was ordained pastor of the Park street church, Boston, where he remained for ten years. Ill health obliged him to resign his charge in 1826, when he returned to New Haven, and occupied himself in writing the life and editing the works of the elder President Edwards, which were published in 1829. In 1828, in connection with his brother Henry, he opened in New Haven a school for boys, on the plan of the German gymnasiums, which was continued for three years. In March, 1833, he was chosen president of Hamilton college, N. Y., and the same year he received the degree of D. D. from Yale college. In 1835 he resigned his presidency, and in 1838 removed to New York, where sickness disabled him for active service. He died while on a visit to Philadelphia for medical advice. He published at various times several sermons and addresses, "The Life of Brainerd" (1822), a volume on the "Atonement" (1826), "Life of Edwards" (1830), and "The Hebrew Wife" (1836). A volume of his "Select Discourses" was published in 1851, together with a memoir by his brother, the Rev. Dr. W. T. Dwight. **III. William Theodore**, an American lawyer and clergyman, brother of the preceding, born at Greenfield Hill, Fairfield, Conn., June 15, 1795, died at Andover, Mass., Oct. 22, 1865. He graduated at Yale college in 1813, was a tutor there from 1817 to 1819, and was admitted to the bar in Philadelphia in 1821. After practising his profession for ten years he studied theology, and in 1832 became pastor of the third Congregational church in Portland, Maine, which position he held till May, 1864. He was one of the most prominent and influential ministers in Maine, and a popular preacher. He published in 1851 a memoir of the Rev. Sereno Edwards Dwight, and was the author of many addresses and reviews. **IV. Theodore**, an American lawyer, author, and journalist, brother of Timothy Dwight, born in Northampton, Mass., Dec. 16, 1764, died in New York, June 11, 1846. He studied law with his uncle, Judge Pierpont Edwards of Hartford, Conn., became eminent in his profession, and a leading speaker and writer of the federal party. He was for several years a senator in the Connecticut legislature, a representative in congress from that state in 1806-'7, and editor during the war of 1812-'14 of the "Hartford Mirror," the leading organ of the federal party in the state. During the session of the Hartford convention in 1814 he acted as its secretary, and in 1833 published a "History of the Hartford Convention," written from a strong federal point of view. From 1815 to 1817 he edited the "Albany Daily Ad-

vertiser," and in the latter year removed to New York, where he established the "New York Daily Advertiser," of which he remained the editor till 1836, when he retired to reside in Hartford. Three years before his death he returned to New York. In 1839 was published his "Character of Thomas Jefferson as exhibited in his own writings," a book intensely partisan. He was also the author of a "Dictionary of Roots and Derivations," and of several other educational works. **V. Theodore**, an American author, son of the preceding, born in Hartford, March 3, 1796, died in Brooklyn, N. Y., Oct. 16, 1866. He graduated at Yale college in 1814, and intended to study for the ministry, but was attacked with hæmorrhage of the lungs and ordered abroad by his physician. After travelling over the greater part of Europe, he published in 1824 "A Tour in Italy." In 1833 he removed to Brooklyn and engaged in many public and philanthropic enterprises. He assisted his father in editing the "Daily Advertiser," was for a time editor and publisher of the "New York Presbyterian," and contributed to most of the principal magazines and other periodicals. He was a man of great cultivation, conversing with ease in the French, Italian, Spanish, and Portuguese languages, and having a good knowledge of German, Greek, Hebrew, and Arabic. At the time of his death, which was caused by a railroad accident, he was engaged in translating American works of instruction into Spanish, with the purpose of introducing them into the Spanish American countries. He was the author of a "History of Connecticut" (1841), "The Northern Traveller" (1841), "The Roman Republic of 1849" (1851), "Life of Garibaldi" (1859), and of a number of educational works.

DWINA, or **Dvina**, **Northern**, a river of Russia in Europe, formed in the government of Vollogda by the junction of the Sukhona and Vithegda, flows N. W. into the government of Archangel, where it receives the Pinega and the Vaga, and after a course of about 400 m. falls through several mouths, forming a number of islands, into the White sea, nearly 30 m. below the city of Archangel. It is navigable for its whole length, with an average width of 550 ft., and is the largest stream in northern Europe, traversing a marshy country, and increased by numerous affluents. It forms part of a system of canals completed in 1807, by which a water communication is established between the White, Baltic, Black, and Caspian seas. (For the Southern Dwina, see **DŪXA**.)

DYAKS. See **BORNEO**.

DYCE. **I. Alexander**, a British scholar, born in Edinburgh, June 30, 1797, died in London, May 15, 1869. He was educated at the high school of Edinburgh and at Exeter college, Oxford, and was several years a curate in Cornwall and Suffolk. In 1827 he removed to London, and for more than 40 years devoted himself to literary and critical studies. His publications were numerous and valuable, showing

not only patient industry and research, but great sagacity and acuteness. His editions of the older English dramatists are highly esteemed. In 1836-'8 he published an edition, with notes, of the works of Richard Bentley (3 vols.). He also contributed to Pickering's "Aldine British Poets" revised texts of Pope, Collins, Beattie, and Akenside, and brief but excellent biographical sketches of these writers. Through his efforts, in conjunction with Collier, Halliwell, Wright, and others, the Percy society was founded in 1840, for the publication of old English ballads and plays. Two editions of Shakespeare, one in 6 vols. (1850-'58), and the other in 9 vols. (1864-'7), contain the finished results of his critical labors and researches. He also wrote "Recollections of the Table Talk of Samuel Rogers." **II. William**, a British painter, cousin of the preceding, born in Aberdeen, Scotland, about 1805, died at Streatham, England, Feb. 14, 1864. He was educated at the university of Aberdeen, and obtained the degree of M. A. in 1822. After studying painting at the academy of Edinburgh, he spent two years (1825-'7) at Rome. On his return he settled in Edinburgh. Having been appointed head master of the school of design, he removed to London in 1838, and subsequently became professor of painting in the university of London. He was elected an associate of the royal academy in 1845, and royal academician in 1848. Having distinguished himself by his frescoes at the Westminster competition in 1844, he was one of the artists chosen to decorate the palace of Westminster and the house of lords, and executed several frescoes at Osborne house. Among his works are "St. Dunstan separating Edwy and Elgiva," "Baptism of Ethelbert" (in the house of lords), "King Joash shooting the Arrow of Deliverance," "Madonna and Child," "Meeting of Jacob and Rachel," "Lear in the Storm," "Christabel," "The Good Shepherd," "Titian preparing to make his Essay in Coloring," "Neptune assigning to Britannia the Empire of the Sea," frescoes in All Saints' church, Margaret street, "St. John leading home his adopted Mother," "The Man of Sorrows," and "George Herbert at Bemerton."

DYEING. Among the first records of the human race are frequent intimations of an appreciation of the brilliant hues displayed by natural objects, and means were early found of appropriating them for the adornment of personal apparel. To the fine linen were transferred the brilliant blue, scarlet, and purple hues extracted from vegetable or animal substances, the last named color reserved exclusively for the vestments of kings and high priests. The skins of the ram and the badger used by Moses for the tabernacle were dyed red, and in his time the art of coloring woollen purple was already known. The Tyrians early attained a high perfection in the art, and their king sent to Solomon a man skilful to work "in purple and blue, and in fine

linen and in crimson." Along the coast of Phœnicia they found the two kinds of shellfish called by Pliny the *buccinum* and *purpura*, and from them they extracted a juice which caused their name to be ever associated with the rich purple dye. In such estimation was this held in the time of the Roman emperors, that a pound weight of the cloth which had been twice dipped in it was sold, as Pliny states, for a sum equal to about \$150. But its use being restricted to the emperors, the art of preparing it was at last lost. It was revived in the 17th and 18th centuries in England and France, but better colors and cheaper processes were then in use. The discoverers and early conquerors of the countries of North and South America were astonished by the skill exhibited by the Peruvians and Mexicans in the application of numerous beautiful dyes extracted from forest trees. According to Pliny, the methods of dyeing black, blue, yellow, and green were brought into Greece on the return of the expedition of Alexander the Great from India, where it appears that the art of coloring cotton cloths with rich and permanent dyes had long been known and practised. The Venetians and Genoese in the height of their prosperity, in the time of the crusades, transferred the art to Italy; and Florence in the early part of the 14th century, it is said, contained 200 dyeing establishments. The important dyestuff archil was discovered about the year 1300 by a merchant of Florence. In the 15th century a work upon dyeing was published in Venice, of which subsequent editions were issued down to 1548, containing full details of the processes employed. From this work it appears that the use of indigo was unknown in Europe at the latter date, though in India it was probably an important article in dyeing at the remotest periods. It was afterward introduced from America together with cochineal, logwood, annatto, quercitron, Brazil wood, and other dyes; but its use in England and Saxony, as of logwood also, met with the most determined opposition. The cultivators of the wood then in use for dyeing blue caused decrees to be issued against indigo as a most dangerous product. By the German diet in 1577 it was declared to be "a pernicious, deceitful, eating, and corrosive dye;" and the name was given it of food for the devil. An act of parliament in the reign of Elizabeth forbade its use, and authorized the destruction of it and of logwood wherever found, and this continued in force for nearly a century. About the year 1630 it was discovered that the crimson color obtained from cochineal might be converted into a brilliant scarlet by the application of a salt of tin. The introduction of this metal as an occasional substitute for alum as a mordant is attributed to a dyer named Cornelius Drebbel. The use of pure mordants marks the great improvement of the art in modern times, as also the introduction of a great variety of new dyes ob-

tained from mineral substances. The Flemings during the 17th century carried the skill to which they had attained in this art into Germany, France, and England. After them the French directed particular attention to it, and men of eminence in chemical science, as Du Fay, Hellot, Macquer, and Berthollet, were appointed by the government to investigate and perfect the processes. The method practised in the East of giving to cotton the beautiful and permanent Turkey red dye was made known in their publications, and the art was about the same time introduced into France by some Greek dyers. The business was afterward permanently established at Glasgow by a Frenchman named Papillon.—The art of dyeing consists in the application of colors, principally organic, to animal or vegetable fibre or fabrics, such as silk, woollen, linen, or cotton. Some colors possess the property of uniting with the fibre without the intervention of any other body, the coloring matter being immediately taken up and retained in an insoluble state; such are called substantive colors. Others require the presence of another substance called a mordant, which furnishes a base for the coloring matter to unite with, and which also acts upon the fibre in such a way as to cause the insoluble dye to adhere more closely; these are called adjective colors. The materials also which are to be dyed have different powers of absorbing and retaining coloring matters; wool and silk possessing a greater facility in this respect than cotton or linen. Wool requires much less preparation than cotton to fit it to receive dyes, either with or without the use of mordants, it being only necessary to cleanse it from a fatty substance called the yolk, which is done by scouring it in a weak alkaline solution. The natural varnish which covers the fibre of silk does not prevent it from absorbing the dye, it being only necessary to rinse it in soap lye at a moderate temperature; but to remove the varnish boiling in an alkaline solution is usually practised. The dyeing substance must be applied in a state of solution, that the fibres of the material to be dyed may imbibe it. If, however, it remains in the fibre in a soluble state, it does not constitute a true dye, this term being only applied to a color which is retained as an insoluble precipitate. A color that may be washed out with warm soap suds or a weak alkaline solution is called a fugitive color; and one which will resist the action of these agents is called a fast color. Coloring matter may be fixed within a fabric by three methods: 1. By dissolving the dye in some material which being afterward abstracted will leave it in an insoluble state as regards ordinary solvents, such as soap suds and weak alkaline or acid solutions. If a cloth is stained with a solution of oxide of copper in aqua ammonia, the evaporation of the ammonia will leave the oxide of copper deposited in an insoluble state in and upon the fibre. The deposition in an insoluble condi-

tion of several coal-tar colors from alcoholic solutions is another instance of this mode of dyeing. 2. The coloring matter may be rendered insoluble by subjecting the material stained with it to the action of warm air, a process called ageing. Such is the case with indigo, quercitron, sumach, and fustic. The oxidizing process may also be accomplished by adding some oxidizing material, as when cloth is dyed black with logwood and chromate of potash, the hæmatoxyline of the wood being oxidized and chromic acid reduced to chromic oxide; or when aniline black is produced by the action of chlorate of potash, ferrocyanide of potassium, or chromate of copper upon aniline oil. 3. The coloring matter may be precipitated by the use of a mordant, and this is the most important as well as the most common method. A mordant, strictly speaking, is a solution of some substance which, not being itself a dye, has an affinity for the material to be dyed as well as for the coloring matter of the dyestuff, so that by its means the precipitate will be more firmly fixed upon and within the fibre. Organic coloring matters are generally more firmly fixed than inorganic by the use of mordants. A color is often produced upon a fabric by using two metallic salts whose double decomposition produces an insoluble compound, as for instance the formation of Prussian blue by the action of hydroferrocyanic acid upon a salt of iron, or the production of chromate of lead by using chromate of potash and a soluble lead salt. These latter substances when used in this way are considered by some as not being strictly mordants, but they can hardly be placed in any other category with convenience. The following are the more important mordants: alum; sulphate, acetate, and hyposulphite of alumina; aluminate and stannate of soda; chloride of tin; acetate of iron; fatty substances, as Gallipoli oil in Turkey red dyeing; albumen, gluten, and caseine. Tannin is used in some cases as a mordant for madder and aniline colors, and for some metallic salts. Most dyes of organic origin can only be fixed by the use of mordants, but the original color may be much modified by these agents. With alumina compounds madder yields red, pink, and scarlet; with salts of iron, according to the degree of concentration, lilac, purple, and black. Dyed goods are often brightened by passing them through weak acid or alkaline solutions, soap suds, bran bath, or some other dye material. If a piece of cotton stuff is simply stained with a decoction of logwood, the color may be readily washed out with pure water. If, however, it is first dipped in a solution of protosulphate of iron and afterward washed, it will be found stained, a portion of the iron having been converted, either by the action of the air or of the fibre, into insoluble oxide. If the cotton is now dipped into a decoction of logwood, the coloring matter of the latter will combine with the oxide of iron within and upon the fibre,

and form a color which cannot be removed by washing in water. If the cotton is dipped in the sulphate of iron solution and not washed, but passed through an alkaline solution, so that the alkaline base may abstract the acid from the iron salt, a much greater quantity of oxide of iron will be formed within and upon the fibre, and a greater depth of color will be given to it by subsequent immersion in the decoction of logwood. When a solution of sulphate of iron and a decoction of logwood are added to each other, the same insoluble coloring matter will be precipitated in the mixture that was formed by bringing the two solutions together in the fabric. If cotton be now immersed in the mixture, it may be feebly stained, but can hardly be said to be dyed. If, however, a piece of woollen be placed in it, it will become strongly dyed. The precipitates which are formed by the combination of the decoctions of dyestuffs, or the pure coloring matters obtained from them, with the bases of certain salts, are called lakes. The salts which are principally used for this purpose are those of aluminum and tin, because, their oxides being colorless, the lakes take the tints of the coloring matters. The lakes obtained with the use of iron salts have a different hue from the original coloring matters, being generally duller. In the salts of aluminum, tin, and iron, the base and acid are not held together by a very strong affinity, and consequently their separation by the attraction of the coloring matter for the base is easily effected; but the acetates are more readily decomposed than the corresponding sulphates, and therefore a mixture of alum with acetate of lead is often used as a mordant. Heat is employed in many cases to facilitate chemical action in dyeing, the solution of salt and coloring matter sometimes remaining together in the cold state without producing a precipitate, where boiling will at once cause it to appear. Sometimes the precipitation is effected by the addition of another substance; thus when a mixture of a solution of alum with certain coloring matters remains clear, a precipitate is formed by the addition of an alkali, which, taking the sulphuric acid from the alum, leaves the alumina to combine with the coloring matter. The principal use of mordants is therefore to form insoluble lakes; but the number of substances that can be used as mordants is much less than of those which may be used for making lakes, on account of the action which some of them have upon the fibre, as well as the influence of the fibre upon their action. The tendency of aluminum, tin, and iron salts to become basic, and of their bases to unite with coloring matters, is what renders them so well adapted to the dyer's art. A cloth to which a mordant has been applied requires before it is dyed to have a certain amount of the mordant fixed within its fibre, and the remainder removed. Fixing the mordant (ageing) is principally accomplished by heat, which promotes the separation of the base

from the acid: It was formerly effected with cotton goods by hanging them up after mordanting in a warm room; but now it is more quickly performed by combining the action of moisture with that of heat. An excessive consumption of coloring matter is avoided by the removal of superfluous mordant; and in the case of printed goods this is necessary to prevent the spreading of the color over the unprinted portions of the surface.—Wool may be dyed in the fleece, in the yarn, or in the cloth. It is usual, for fast colors, to mordant the goods with a solution of alum and cream of tartar; or the latter salt may be used with chloride of tin or with sulphate of iron, the selection depending upon the color which may be desired. For dyeing wool blue the best material is indigo, as it yields the finest and fastest color. This substance is not ready formed in the plants from which it is obtained, but is generated by exposing the juice to the action of the air. It is technically called indigotine, and sometimes oxidized indigo, and is precisely the same substance which exists in the dyed cloth and gives it its color. That it may be deposited in the fibre it is, however, necessary to reduce it to a soluble condition. This is effected by what has been termed deoxidation, but which is more strictly the absorption of hydrogen, as will presently be explained. Soluble indigo, called indigogene, is white, and soluble in alkaline liquors; but upon exposure to the air it parts with the hydrogen which had been absorbed, and again becomes indigotine or blue indigo. It was thought by Chevreul that the juice of the living plant contained indigo white, but this idea cannot be maintained in the light of the fact that white indigo is only soluble in alkaline liquids, whereas the juices of plants are acid. Moreover, the investigations of Schunck show that the organic substance in the living plant which is converted into indigo by fermentation is different from indigo white; he has named it indican. (See INDIGO.) The process of dyeing wool with indigo is accomplished in what are called blue vats, the formation of which differs somewhat in different countries. The German vat, which is very manageable, and may be used for two years by merely replenishing, is composed as follows: To 2,000 gallons of water, heated to 130° F., are added 20 lbs. of crystals of common carbonate of soda, 2½ pecks of bran, and 12 lbs. of ground indigo. The mixture being well stirred, fermentation commences in about 12 hours, the liquid assuming a green color. There are then added 2 lbs. of slaked lime, and the vat is again heated and covered for 12 hours longer, when about the same quantities of soda, bran, and indigo, with some lime, are again added. The vat is ready to be worked in about 48 hours after the commencement. It is usual also to add five or six pints of molasses to promote fermentation. Should this become too active, it is repressed by the addition of more lime; and if it is not

active enough, more bran and molasses are added. The bran and molasses are called reducing agents, because the fermentation which they undergo decomposes a portion of the water, abstracting the oxygen, while the hydrogen is taken up by the insoluble indigotine, or blue indigo, $C_{16}H_{10}N_2O_2$, which is thus converted into white indigo, or indigogene, $C_{16}H_{12}N_2O_2$, which is soluble in alkaline solutions, but not in pure water. The dyeing is performed by suspending the fabric on frames and moving it about in the vat for about two hours. It is then washed with water and treated with very dilute hydrochloric or sulphuric acid, to remove the alkali. In England blue vats for wool are made with water 500 gallons, indigo 20 lbs., carbonate of potash 30 lbs., bran 9 lbs., madder 9 lbs. The water is heated to just below the boiling point, and the potash, bran, and madder are put in first, and then the indigo, which in all cases should be previously very finely ground. Cold water is added to reduce the temperature to 90° F., which is maintained constantly by a steam pipe. The ingredients are well stirred every 12 hours, and the vat is ready to be worked in 48 hours. It cannot, however, be used for more than a month, and is also more expensive than the German vat, on account of the potash. For dyeing cotton goods, especially if they are heavy, the German vat is used with advantage; but most calicoes are dyed with the cold lime and copperas vat, which is made with 900 gallons of water, 60 lbs. of green copperas, 36 lbs. of ground indigo, and 90 lbs. of slaked lime, stirred every half hour for three or four hours, then left 12 hours to settle and stirred again, when it is ready for dyeing. The reactions are the formation of sulphate of lime and protoxide of iron, which latter body, by reason of its affinity for oxygen, removes this from a portion of the water, leaving the hydrogen to unite with the blue and form white indigo, which is soluble in the excess of lime. For dyeing Saxony blue sulphindigotic acid is employed, a substance formed by the action of concentrated sulphuric acid on indigo. It is made by treating one part of indigo with about five parts of fuming sulphuric acid. The solution is then poured into a vessel containing water, and in this the wool is immersed for 24 hours, when there will be formed upon it insoluble sulphindigotate of alumina. Wool is dyed with Prussian blue by immersing it in a solution of persulphate or pernitrate of iron and then passing it through a solution of ferrocyanide of potassium acidulated with sulphuric acid, by which brilliant, blue, insoluble ferrocyanide of iron, or Prussian blue, is formed. Wool is generally dyed yellow with weld, fustic, or quercitron bark. The yellow coloring matter of weld, luteoline, is extracted by boiling water, to which sometimes caustic lime or alkalis are added to increase the solvent power. Luteoline dissolves with a deep yellow color in caustic alkalies and alkaline carbon-

ates. Its aqueous extract yields beautiful yellow precipitates with alum, chloride of tin, and acetate of lead. Alum and cream of tartar are generally used together as the mordant for this color. The use of weld for wool dyeing has been abandoned in England, but is retained on the continent, and is also largely used there in silk dyeing. It has only about one fourth the tinctorial power of quercitron, which has so greatly superseded it. Fustic or yellow wood is generally considered the most suitable material for working with other colors, and is therefore extensively used. Quercitron bark has, however, more tinctorial power, and is largely used. Either dyestuff is made into a decoction with boiling water, and the goods are mordanted with alum, to which there is sometimes added chloride of tin, which increases the brilliancy of the color. Wool is dyed red with cochineal, with madder, and with coal-tar colors. Madder is used for the more common goods, but for the finer, on account of their superior brilliancy, cochineal colors, and for their peculiar hues the coal-tar colors, are used. The process with madder consists in mordanting the goods with a warm solution of alum and cream of tartar, and afterward immersing them in a madder bath, containing two parts of madder, by weight, to one of the goods, which after dyeing are thoroughly washed. The preparations of madder, such as flowers of madder and garancine, may be used in place of the pulverized root. The dried and ground root, besides containing the two chief coloring principles, alizarine and purpurine, also contains some resinous fawn-colored dyes, which exert an injurious effect when dissolved in the dye; but as they require a higher heat than the two named, it is usual in making a decoction of madder root not to raise it to the boiling point. Flowers of madder and garancine contain scarcely any other coloring matters than alizarine and purpurine. Instead of using the ground root which has undergone a slow fermentation by which the alizarine and purpurine are produced, E. Kopp has invented a process entirely different, and which consists in dissolving the unaltered coloring principle of the living plant, rubian, in sulphurous acid, and subsequently changing it into alizarine and purpurine by the action of sulphuric acid and heat. The process is extensively employed by MM. Schaff and Lauth of Strasburg. (See MADDER.) Woollen may be dyed a scarlet or a crimson by the use of cochineal. In dyeing scarlet, cream of tartar, chloride of tin, and cochineal are used together as a mordant, the dyeing liquor being composed of cochineal and tin salt. If a crimson color is desired, it may be communicated by a single process, or the material may be first dyed scarlet. If by one process, a solution of $2\frac{1}{2}$ oz. of alum and $1\frac{1}{2}$ of cream of tartar for every pound of stuff is used as a mordant, the dyeing being done with an ounce of cochineal and a smaller quantity of tin salt than is used for

dyeing scarlet. Scarlet may be turned to crimson by using a bath containing an alkaline solution or alum, the latter being generally used. Wool is usually dyed green by first dyeing it blue, mordanting with cream of tartar and alum, and dyeing again with fustic or weld. Sometimes, as in dyeing the woollen fabric for covering billiard tables, alum, cream of tartar, Saxony blue, and fustic are all put together and the cloth immersed in the mixture and boiled two hours, then thoroughly washed and brightened in a second bath of fustic and Saxony blue. Woollen goods may be dyed black with aniline black or with a salt of iron and tannic or gallic acid. To obtain the finest and fastest colors, they are first dyed with madder or indigo. The goods are then mordanted with sulphate of iron and put in a bath made of a decoction of logwood, sumach, or galls. The celebrated Sedan black is produced by first dyeing blue with woad, washing, again dyeing with sumach and logwood, boiling three hours, and then adding a solution of sulphate of iron. Wool, by reason of its great affinity for tar colors, may be dyed with them of almost any hue or shade by simple immersion, subsequent exposure to the air, and washing.—Silk, after treatment in the hot soap bath to remove the varnish, may be dyed without bleaching (sulpharing); but when bright colors are required the goods should be bleached. It may be dyed black by means of logwood with an iron mordant; with logwood and bichromate of potash; with gallic or tannic acid in any form, with iron mordant; or, according to a recent method of Jules Persez, by mordanting with bichromate of potash and sulphate of copper and immersing in a solution of aniline. Silk may be dyed blue with indigo, Prussian blue, or aniline blue. When indigo is used, it is commonly in the form of sulphindigotic acid, or indigo carmine. It is dyed with Prussian blue by using a mordant of nitrate of iron. Napoleon blue is produced by using a mordant of nitrate of iron and chloride of tin, passing through a boiling soap solution, and dyeing with a solution of ferrocyanide of potassium to which has been added hydrochloric acid. The brilliancy is increased by subsequent treatment with solution of ammonia. Silk is dyed with aniline blue by simple immersion for a sufficient time in a solution of the dye in wood spirit or alcohol. Coal-tar colors are now used extensively in dyeing silk, especially the various shades of red, and have largely taken the place of cochineal, although the latter continues to hold its superiority for producing scarlet and crimson. In cochineal dyeing the silk is mordanted with alum, washed, and then immersed in a dye bath made by boiling 2 oz. of white galls for every pound of silk, adding 3 oz. of powdered cochineal, and afterward one fourth of an ounce of cream of tartar, and when it is dissolved, the same quantity of chloride of tin. Silk is more often dyed with fuchsine, coral-line, or naphthaline red, the process being the

same as for blue, simple immersion and subsequent washing and exposure. Aniline red, also known as rosaniline, fuchsin, Magenta, and Solferino, is made by combining aniline with various mineral compounds, and also acids, such as chloride of iron, tetrachloride of tin, nitrate of mercury, nitric acid, and arsenic acid, the last named substance being the one most used. The aniline may be separated from its mineral combinations by the action of alkalis, and the precipitate redissolved in acetic or hydrochloric acid, in one case forming an acetate of rosaniline or fuchsin, and in the other a hydrochlorate. Mauve, or aniline purple, was the first discovered of the aniline dyes, and consists of some salt of mauvine, as the sulphate, according to the process of Perkin, the discoverer, which consisted in oxidizing aniline with bichromate of potash and sulphuric acid. It may be prepared by using other reagents, as by the action of chloride of lime on a solution of aniline in hydrochloric acid. Silk is dyed with it by simple immersion in the alcoholic solution until the desired color is obtained. By the addition of acids a more decided purple may be formed. Since the discovery by Gräbe and Liebermann, in 1869, of the process of artificially producing alizarine from anthracene, this dye, which in chemical composition and behavior is identical with alizarine obtained from madder, has to a considerable extent taken its place, and is one of the principal coal-tar colors. It is used with mordants in a similar manner to that for the preparations of madder. (See ALIZARINE.) Silk is usually dyed yellow, especially on the continent of Europe, with weld, using alum as a mordant. In England, according to the plan of Mr. Bancroft, quercitron bark is frequently substituted, alum being retained as the mordant, to which sometimes a small quantity of tin salt is added. It is cheaper, and is thought to produce a color equal to that given by weld. Silk may be dyed a fast green by mordanting with persulphate of iron, dyeing blue with ferrocyanide of potassium, and afterward adding the yellow by treatment with fustic; but of late aniline green or emeraldine has been used with as much advantage as it previously had been with cotton. It is produced by dyeing with acid hydrochlorate of aniline goods which have been mordanted with chlorate of potash. If they are subsequently passed through a solution of chromate of potash, they are changed to a deep indigo blue, called azurine.—Cotton and linen are more difficult to dye than wool or silk, and require stronger mordants. Cotton may be dyed blue with the cold lime and copperas vat described for dyeing wool, and also by the use of sulphindigotic acid, and linen may be dyed by the same method. Either fabric may be dyed yellow with weld, fustic, quercitron, chrome yellow, or acetate of iron (nankin). The most brilliant and permanent red which can be imparted to cotton goods, Turkey red, is produced by first saturating them in a

mixture of 100 lbs. of Gallipoli oil, 20 lbs. of pearlash, and 50 gallons of water. This mixture is sufficient for the preparation of about 2,000 yards of calico. After padding, the pieces are exposed to the air at a temperature of 90° or 100° F. for 24 hours, and the padding and ageing are repeated as many as eight times when a deep color is required. The portion of the oil which has not suffered oxidation is then removed by steeping in an alkaline solution, and the goods are well washed. To a decoction of 30 lbs. of gall nuts there are added 120 lbs. of alum and 10 lbs. of acetate of lead, and the liquor is made up to 120 gallons. The goods are then immersed in it and aged three days, and fixed by passing through ground chalk mixture. They are then washed and dyed in madder, to which are added some sumach and blood. For deep colors the galling, aluming, and dyeing are repeated. The color is then a heavy brown red, which is brightened by soaping, or treatment with dilute nitric acid. The influence of the Gallipoli oil (a crude kind of olive oil) has long been a matter of discussion, but no settled conclusion has been reached in regard to it. It has often been attempted to shorten the process, but without success, except in the clearing and brightening, for which garancine, the product obtained by treating madder with concentrated sulphuric acid, has been used with advantage.—The fullest information in regard to the present state of the art of dyeing is given under the various related titles in Watts's "Dictionary of Chemistry" (6 vols., London, 1870-'72), and Wagner's "Chemical Technology" (New York, 1872). Among special works on the subject are those of C. L. and A. B. Berthollet, "Elements of the Art of Dyeing and Bleaching" (London, 1841); Robert McFarlane, "A practical Treatise on Dyeing and Calico Printing" (New York, 1860); M. Reimann, "Handbook of Anilines" (New York, 1868); Charles O'Neill, "Dictionary of Dyeing and Calico Printing" (Philadelphia, 1869); and James Napier, F. C. S., "Chemistry applied to Dyeing" (Philadelphia, 1869).

DYER, a W. county of Tennessee, separated from Missouri by the Mississippi river, and drained by Obion and Forked Deer rivers; area about 400 sq. m.; pop. in 1870, 13,706, of whom 2,893 were colored. The soil is rich, and the surface level and partly occupied by excellent timber tracts. The chief productions in 1870 were 74,090 bushels of wheat, 749,175 of Indian corn, 99,213 lbs. of butter, 412,440 of tobacco, and 4,908 bales of cotton. There were 3,855 horses, 3,531 milch cows, 5,571 other cattle, 8,831 sheep, and 36,448 swine. Capital, Dyersburg.

DYER, George, an English author, born in London, March 15, 1755, died there, March 2, 1841. He was educated at Christ's hospital and at Emmanuel college, Cambridge, and was successively a tutor, Baptist minister, parliamentary reporter, and writer. He was a schoolmate and

intimate associate of Charles Lamb. In 1830 he lost his eyesight. He was joint editor of Valpy's combination of the Delphin, Bipont, and Variorum editions of the Latin classics, and published a "History of the University and Colleges of Cambridge" (2 vols., 1814), "The Privileges of the University of Cambridge" (2 vols., 1824), and "Academic Unity" (1827).

DYER, John, an English poet, born at Aberglasney, Carmarthenshire, in 1700, died July 24, 1758. He was educated at Westminster, and after a short study of painting he rambled over England as an itinerant artist. In 1727 he published his "Grongar Hill," a poem marked by warmth of sentiment and an elegant simplicity of description. He travelled in Italy to pursue his studies as a painter, but the best result of his observations was his poem entitled "The Ruins of Rome" (1740). On his return he entered holy orders. In 1758 appeared his longer poem of "The Fleece," in which he attempted to treat the subject of wool in a poetical manner, and which is one of the most successful imitations of Virgil's "Georgics." All the poems of Dyer abound in happy and careful pictures of nature, and in appropriate and gentle moral sentiments. They were published collectively in 1761.

DYER, Mary, a victim to the persecution which befell the Quakers in the early history of Massachusetts, hanged on Boston common, June 1, 1660. The government of Massachusetts banished Quakers and sentenced to death any one of them who should be guilty of a second visit to the colony. The statute was construed as an invitation instead of a menace by those against whom it was directed. Mary Dyer had departed from their jurisdiction upon the enactment of the law, but soon after returned on purpose to offer up her life. She was arrested and sent to prison, was relieved after being led forth to execution, and was against her will conveyed out of the colony. She speedily returned and suffered as a willing martyr.

DYMOND, Jonathan, an English author, born in Exeter in 1796, died May 6, 1828. The son of a linen draper, and himself engaged in the business, he composed his books amid the pressure of other occupations. He was a member of the society of Friends. He published in 1823 an "Inquiry into the Accordance of War with the Principles of Christianity," a work which attracted much attention. His fame rests chiefly on his "Essays on the Principles of Morality," published in 1829, soon after the death of the author.

DYNAMICS. See MECHANICS.

DYNAMITE. See EXPLOSIVES.

DYNAMOMETER (Gr. *δύναμις*, force, and *μέτρον*, a measure), an instrument originally designed to ascertain the strength of men and animals, of the limbs of the body, the fingers, &c. Its application was afterward extended to the determination of the power exerted by machines, or of any portions of them, and the instrument

has hence come into use as a meter of the power of engines. The principle of the earlier contrivances was to weigh the force exerted by the amount of compression or of deflection produced upon an elliptical steel spring; this in the former case being drawn together by the application of the power and of the resistance at the two opposite ends, and in the latter separated by the force and resistance being applied upon the opposite sides of the spring, on the line of the minor axis of the ellipse; an index upon a graduated arc attached to the spring showed the amount of deflection. Another contrivance was a spiral spring enclosed in a tube, the force being applied in the direction of compression. By such means the greatest power exerted by one impulse was indicated; but as in most instances the power is not constant for any determinate time, the index must fluctuate in such a manner that the mean effort it should represent cannot be ascertained. If known, its amount multiplied by the time of continuance of the operation would give as a result the value of the whole power exerted. Instruments have been devised by MM. Poncelet, Morin, and others, which register upon papers, made to pass by a clockwork movement under the index, curved lines from which the whole power is directly calculated from the areas enclosed; the ordinates of the curves representing the power exerted, and the abscissas the length of time, or in some instances the space run over. The apparatus might be fixed to a carriage, the length of the index paper in this instance bearing a certain proportion to the length of the road gone over. A great number of different forms of this instrument have been devised by eminent engineers of France, England, and the United States. One by Watt, improved by Macknought, gives the force exerted by the piston of a steam engine against a spiral spring, a style attached to the piston inscribing a line representing its position during the unrolling of the paper which moves at an even rate against it. In the *Dictionnaire des arts et manufactures* the subject is fully treated in the article *Dynamomètre*, by M. Laboulaye. The descriptions of the various forms of the apparatus are made intelligible by many illustrations. In Appleton's "Dictionary of Mechanics," also, many forms of the apparatus are figured and described; and the following simple contrivance, applicable in some instances, is proposed: A cylinder of some material heavier than water is suspended in this fluid by a rope passing over a pulley. As power is applied to this rope to draw the cylinder out of the water, the increasing weight of this, as more is raised into the air, will at last cause the resistance to equal the force applied, the cylinder being sufficiently large and long. By means of a scale properly arranged, the amount of the power applied may be accurately measured.

DYRRHACHIUM, a city of ancient Illyricum, on the coast of the Adriatic, occupying very

nearly the site of the town known in Grecian history as Epidamnus. The latter is said to have been founded by the Coreyrians and by settlers from Corinth, about 627 B. C. Owing to its favorable situation, it soon became a wealthy and populous colony; and the Peloponnesian war arose in great part from a contest between Corinth and Coreyra brought about by appeals to them by the contending factions of Epidamnus. About 310 the Illyrians made themselves masters of the place, and not long afterward the inhabitants put themselves under the protection of the Romans, by whom its name was changed to Dyrrhachium. At a later period it was prominent in the contest between Cæsar and Pompey, and in 1081-2 became memorable for its siege and capture by Robert Guiscard, who defeated there the Greeks under their emperor Alexis. (See DURAZZO.)

DYSART, or **Desart**, a parliamentary borough and seaport town of Fifeshire, Scotland, 12 m. N. N. E. of Edinburgh, on the N. side of the frith of Forth; pop. in 1871, 8,920. The town is very old, and in former times was a place of much importance. It carries on ship building, flax spinning, and manufactures of damasks and ticks. There are coal and iron mines in the vicinity.

DYSENTERY (Gr. *δυσ*, ill, and *έντερον*, intestine), an inflammation of the large intestine, producing frequent straining efforts at stool, attended by small and painful mucous and bloody discharges. Dysentery is more common in hot climates than in temperate ones; in summer and autumn than in winter and spring. It is subject to epidemic influences, being in some seasons frequent and fatal over an extensive region, and then almost disappearing for years. It is more common and severe in malarious districts. It sometimes breaks out and is excessively fatal in public institutions where the inmates have been subject to a vitiated atmosphere and an improper and innutritious diet; and it has often proved very destructive to armies. It is commonly attributed to the use of irritating and indigestible food, and to cold, particularly after the body has been debilitated by a prolonged exposure to heat. The milder cases are attended by little or no fever; but when the disease is severe fever is always present, and may precede though it more commonly follows the local manifestations. There is often much pain and soreness in the lower part of the abdomen or extending along the track of the colon, and frequent calls to stool, attended with painful and often violent straining; the stools consist chiefly of mucus more or less tinged with blood, and sometimes mixed with membranous shreds, or they may consist of blood almost pure, or resemble the washings of flesh; their odor is not feculent, but faint and peculiar, and sometimes fetid; occasionally the neck of the bladder sympathizes with the neighboring bowel, and there is difficulty in passing urine.

While mild cases of dysentery are attended with no danger, when severe the disease is always serious and often fatal; or it may become chronic, and slowly break down the constitution. When death occurs, *post mortem* examination reveals the existence of inflammation and ulceration in the large intestine. The ulcers are often large, irregular in shape, laying bare the muscular and sometimes the peritoneal coat; between them the mucous membrane is thickened, often lined with false membrane, sometimes appearing as if struck with gangrene.—When the pain and tenderness are very considerable, the treatment may be commenced by the application of leeches over the track of the inflamed bowel; if any constipation has previously existed, a dose of castor oil, to which a few drops of laudanum have been added, may be given; opiates and astringents may be afterward administered. From the fact that the rectum is the part of the intestinal canal most affected, opiates in the form of suppositories or enemata are found particularly useful. Calomel has been highly recommended in the treatment of the dysentery of tropical climates, but in temperate regions it is rarely necessary to resort to it. The patient should be confined to his bed, and the diet should be of the mildest and most unirritating character. When the dysentery becomes chronic, the tenesmus subsides, the stools are more copious and loose, and contain pus; the complaint is apt to be tedious and intractable, and when recovery takes place, the digestive organs remain for a long time feeble and irritable. A strictly regulated diet, with the use of opium, combined with a small dose of sulphate of copper or nitrate of silver, are the means commonly had recourse to in its treatment.

DYSPEPSIA (Gr. *δυσ*, ill, and *πέψις*, digestion), or **Indigestion**, a designation under which are commonly grouped all those functional disorders of the stomach which are independent of organic disease, and are not symptomatic of disease of other parts of the economy. Its characteristic symptoms, as given by Cullen, are “want of appetite, nausea, vomiting, flatulence, eructations, and pain; more or fewer of these symptoms concurring, together sometimes with constipation.” Many circumstances must concur to render digestion easy and perfect. The mind should be free from any harassing care or anxiety; otherwise not only the appetite is impaired, but the food is digested with difficulty. The food should be thoroughly masticated and insalivated. After recovery from wasting diseases, a larger quantity of food is required and will be digested than at ordinary times. It should be suited to the digestive capacity of the stomach; if the quantity be too large or the quality too rich, a sense of fulness and weight in the region of the stomach, nausea, heartburn, and eructation of acid and gaseous matters follow; with these symptoms the tongue becomes furred, there is some feverish-

ness, and there is more or less headache; if vomiting occurs, and the ejecta contain bile, the sufferer in ordinary phrase is said to have had a bilious attack. The food should be taken at proper intervals, which are not always the same for all persons; before a second meal is taken, the previous one should be completely digested, and the stomach should have a period of repose. The food ought not only to be of a character which will permit its easy digestion by the stomach and small intestines, but it should also afford a residuum bulky and stimulating enough to maintain a regular action of the bowels. When constipation is induced by neglect, indolent habits, or too concentrated a diet, the stomach is apt to suffer, and dyspeptic symptoms follow. To all these causes of dyspepsia must be added the abuse of fermented and distilled liquors.—When dyspepsia has been induced by any one of the above mentioned causes, its cure is to be sought in the removal of the cause; but this alone will often be found tedious or inefficient. In one class of cases a certain degree of inflammation of the gastric mucous membrane seems to be produced. The presence of food excites pain, which continues so long as the food remains in the stomach; carminatives or stimulants, so far

from affording relief, aggravate the distress. In some cases the diet must be of the blandest and most unstimulating kind, and the amount of food rigidly limited. Restricting the patient to milk, diluted with an equal part of lime water, is sometimes attended by great benefit, and farinaceous articles are preferable to meat. In another and the larger class of cases, neither inflammation nor irritation is present, but the powers of the stomach seem enfeebled; here stimulants relieve the distress, and cause at least a temporary improvement. In such cases a meat diet agrees better than an exclusively farinaceous one, and the patient is benefited by bitter tonics, as colombo, gentian, or quassia. Certain remedies are adapted to the relief of particular symptoms; acidity is relieved by the use of alkalies and the alkaline earths; pain, by bismuth and hydrocyanic acid; flatulence, by carminatives; and constipation, when it cannot be obviated by diet and attention, may call forth the use of some of the purgative mineral waters, or of small doses of aloes in combination with nux vomica. It is in these cases that travel, combining relaxation with mental excitement and exercise, is particularly serviceable.

DZIGGETAL. See Ass.

E

E, THE fifth letter and second vowel of the Latin alphabet, and of those derived from it. It is both short and long, and in the Greek alphabet has two corresponding forms, *ε ψιλόν* (slender E), the fifth letter, and *η τὰ* (long E), the seventh letter (but counting eight if the stigma be included). The short and long O, *ο μικρόν* and *ὀ μέγα*, are analogous to them. Simonides is said to have formed the H (*ἦτα*) by doubling the E (*ε ψιλόν*), thus EΗ, the epsilon having before been both short and long. The H, however, was made by the Latins an aspirate, and was employed to represent the rough breathing, and the aspirate sound in Θ, Φ, and Χ, as *Homerus*, *Thales*, *Philon*, *Charon*. The prototypes of the aspirated Greek letters in question are the Phœnician and Hebrew *He* and *Chet*. Indicating the most fleeting sound of the human voice, a mere breathing in many cases, the letter E is the basis of the vowel system and the most protean of all the vowels, as regards its shades of sound, its convertibility, the modes in which it is indicated in writing, and the uses that are made of it in various graphic systems. But few of its peculiarities can here be pointed out. In English it has five sounds, called long, short, open, obtuse, and obscure, respectively as in *mete*, *met*, *there*, *her*, and *brier*. The long English sound corresponds to the French and German I, while the French nasal E in *em* and *en* sounds like the English *a* in *mart*, and that in *bien* like the *a*

in *man*; and the sound of the French sharp E is represented in English by *a*, *ai*, *ay*, or *ey*, as in *made*, *maid*, *say*, and *they*. In Hebrew it has two sounds; the open is noted by *Tzere* (break), or two horizontal dots under the consonant; the close by *Segol* (grape) or three dots, and two kinds of *Shera* (emptiness), or two vertical dots, the one movable (half mute), the other quiescent (mute). The long E is written AI in Mæso-Gothic. In Greek the long and short E (*ε* and *η*) are both either open or close, but the latter is pronounced as I in Neo-Hellenic, Coptic, and Old Slavic. It is often a euphonic means for facilitating the utterance of words, as in *establish*, *établir*, *establecer*, *épice*, *espíritu*, *esprit*, *escribir*, *écrire*, *estudo*, *état*, *estrella*, *étoile*, *Estévan*, and *Étienne*. It is prefixed for other reasons in *ἐκείνος*, *ecquis*, and many other words. E frequently occurs instead of I in ancient Roman memorials, as on the *columna rostrata* of Duilius, on the tomb of the Scipios, and in manuscripts; thus, *sebe*, *quase*, *macester*, *fuet*, for *sibi*, *quasi*, *magister*, *fuit*. In the Slavic it occupies, as *jest*, the sixth place of the Bukvitsa as well as of the Cyrillic scheme, and has two softening forms as finals (*-er*, *-eri*) toward the close of the alphabet.—Barrois asserts that E signifies one, since it is the initial of the Greek *eis*. As an abbreviation, E stands for Ennius, *eques Romanus*, *egregius*, *emeritus*, *ergo*, *editio*, *east*, electricity, and excellence. The letters *d. e.*

r. stand for *de ed re*; *q. e. d.* for *quod erat demonstrandum*; *e. g.* and *e. c.* for *exempli gratia* and *exempli causa*. In syllogisms, *A* = *asserit*, *E* = *negat*. On French coins it designates Tours; on those of Austria, Carlsburg in Transylvania; on those of Prussia, Königsberg. In Greek, *E* has the value of 5, and with a mark below it, of 5,000. According to Baronius, it represented the number 250 in the period of the decline of classic literature. It denotes the third great interval in modern musical nomenclature, or the fifth string in the chromatic scale, and is called *mi* in vocal music.

EACHARD, John, an English divine, born in Suffolk in 1636, died July 7, 1697. He was a fellow of Cambridge, in 1675 succeeded Dr. Lightfoot as master of Catharine hall, and early became known by his satires against the clergymen of his time. He wrote upon "The Grounds and Occasions of the Contempt of the Clergy and Religion," which he attributed to the insufficient salaries of clergymen, and the consequent necessity for them to eke out a living by unbecoming means. The work passed rapidly through six editions, and drew down upon its author abundant criticisms. He published two dialogues upon Hobbes's "State of Nature," in which he humorously attacked the ideas of that philosopher. An edition of his works was published in 1714, in 3 vols. 12mo.

EADMER, or **Edmer**, an English monk and historian, died in 1124. He was chosen in 1120 bishop of St. Andrews in Scotland, but the Scottish king refusing to allow his consecration by the archbishop of Canterbury, and thus to admit the primacy of that see, he either declined the bishopric or abdicated it after a short possession, and died as a monk of Canterbury. He wrote a life of his friend St. Anselm, often published with Anselm's works, and lives of Wilfred, Dunstan, and other English saints; but his most valuable work is the "History of his own Times," relating the principal events in England and the English church from 1066 to 1122 (best ed. by Selden, 1623).

EADS, James Buchanan. See p. 802.

EAGLE, a bird of prey, of the order *raptores*, family *fulconida*, and subfamily *aquilinae*. The eagles have a strong bill, elevated at the culmen, straight at the base, and much arched to the tip, which is hooked and sharp; the sides are compressed, and the lateral margins festooned; the nostrils are in the cere, large; the wings are long and acute, the third, fourth, and fifth quills usually the longest; the tail is long, ample, mostly rounded at the end; the tarsi are long, either clothed with feathers to the base of the toes as in the golden eagle, or naked and covered with scales as in the bald eagle; the toes are long, strong, armed with large, curved, and sharp claws. In the type genus *aquila* (Mæhr.) belongs the golden eagle of Europe and America (*A. chrysaetos*, Linn.). The length is about 3 ft. 2 in., the extent of wings 7 ft., the bill along the back 2½ in., the tarsus 4½ in., and the middle toe and

claw the same; the bill is very robust, angular above; the head is moderate, the neck short, and the body full; the tarsi are feathered to the toes, and the feet are very stout; the middle toe has a membrane at the base connecting it with the others. These are the dimensions of an adult female, the male being considerably smaller, in conformity with the rule that in birds of prey the females are larger than the males. The plumage is compact, imbricated, and glossy; the feathers of the neck and head are narrow and pointed, and may be erected like a short crest; the tail consists of 12 broad feathers. In the adult the bill is black at the tip, bluish gray at the base, the cere and margins yellow; iris chestnut; toes bright yellow, claws black; general color of the plumage dark brown, glossed with purple; the hind head and neck light brownish yellow, the feathers with dark shafts; the wing coverts light brown; primaries brownish black; tail round-

Golden Eagle (*Aquila chrysaetos*).

ed, dark brown, lighter at the base, irregularly marked with whitish; lower tail coverts, feathers of legs and tarsi, yellowish brown. The immature bird is of a deep brown, with the tail white at the base for three quarters of its length, and dark at the end; this is the ring-tailed eagle of Wilson and others; the adult, from its majestic appearance, is called in Europe the royal eagle; the American species is considered distinct by some, and is called *A. canadensis* (Linn.). The golden eagle is rarely seen in the eastern portion of the United States, though specimens have been obtained in all the northern states; the species is most common in the northwest, on the upper Mississippi, and in the mountainous regions; it is also found in the cold and mountainous districts of northern Europe and Asia. The flight is powerful, though less rapid than that of the bald eagle, being continued for hours in majestic circles at a great elevation, and without apparent exertion; its prey is not seized on

the wing, but is pounced upon on the ground from a great height with rarely failing precision. Its food consists of young fawns, raccoons, hares, wild turkeys, and other birds and animals of similar size, and, when hard pressed by hunger, of carrion; capable of going several days without food, it gorges itself when opportunity offers. Its strength is great, its weight about 12 lbs.; it is able to withstand extreme cold, and pursues its prey in the most violent storms. The voice is harsh and screaming, and very loud at the breeding season. The plumage does not attain its full beauty until the fourth year; the American Indians are fond of using the tail feathers as ornaments for their persons, pipes, and weapons. The nest is large, consists of a rude collection of sticks, and is placed on some inaccessible cliff; the eggs are generally two, of a dull white, with brownish shades, $3\frac{1}{2}$ in. long and $2\frac{1}{2}$ in diameter at the widest part; they are laid in February or March; the young, when able to provide for themselves, are driven from the eyry. This bird is long-lived, individuals, it is said, having been kept in captivity for more than a century. In proportion to their size, the eagles are less courageous and less powerful than the falcons. The noble nature of the eagle, like that of the lion, is mostly a creation of the imagination, founded on external characters which have no corresponding internal qualities; he attacks where he is sure of victory, gorges himself like a glutton, patiently bears forced abstinence from food, and at last soils his beak with carrion; the king bird and the shrike are far his superiors in bravery, and all the qualities which have been specially assumed for him can be found in great perfection in many common birds. The eagle is monogamous, and the mated pair are generally not far from each other; the same nest is used for many years. The scent of the eagle is feeble, but his sight is exceedingly keen. Like the condor, the eagle has been accused of carrying off little children to its nest, but such instances in both birds must be very rare, though they may have occurred. Another species of this genus is the spotted or rough-footed eagle (*A. nevada*, Gmel.), smaller than the golden, of a brownish color, with black white-tipped tail and wings yellow spotted; it is found in the mountains of central and southern Europe and northern Africa, and preys upon the smaller animals.—In the genus *haliaetus* (Sav.) belong the fishing or sea eagles, the best known and largest of which is the bald or white-headed eagle (*H. leucocephalus*, Linn.). The bill is $2\frac{3}{4}$ in. long, very robust, convex above; the head is large, and flat above; neck short and thick; body large, wings long, and tail rounded; the tarsus only 3 in. long, bare for its lower two thirds, and covered with large scales; the feet are short and robust, and the toes are free, rough, and tuberculous beneath, with very sharp curved claws. The plumage is compact and imbricated; the feathers of the head,

neck, and breast are narrow and pointed, and of the other parts broad and rounded; there is a bare space between the bill and eye with a few bristly feathers; the eyebrows are bare and very prominent. In the adult the bill, cere, iris, and feet are yellow, the first three being often almost white; the general color of the plumage is chocolate-brown, the feathers with paler margins; the head, greater part of neck, tail and its coverts, white; the quills are brownish black, with lighter shafts. The length is about 3 ft., and the extent of wings 7 ft.; the female is somewhat larger. In the young bird the bill is black above, bluish gray at the end of the lower mandible; the feathers, which are white in the adult, are dark brown like the rest of the plumage, margined with lighter; the head and tail become white between the third and tenth year, according to circumstances. It is very generally distributed over North America. Its usual food

Bald Eagle (*Haliaeetus leucocephalus*).

is fish, but it eats the flesh of animals when it can get it, and often seizes small quadrupeds and birds of inferior flight, and when pressed by hunger will feed on decaying carcasses. When the fish hawk follows the shoals of fish in the rivers in spring, the eagle sits watching from the top of a tall tree; as soon as the former rises with a fish, and bends his course for the shore to devour it, the latter mounts above him, and forces him to give up his prey; the eagle closes his wings, drops down with great quickness, and seizes the fish before it reaches the water. The flight of this bird is very majestic, accomplished by easy flappings; it sails along with extended wings, and, according to Audubon, can ascend until it disappears from view, without any apparent motion of the wings or tail; and from the greatest heights it descends with a rapidity which cannot be followed by the eye. All authors are agreed as to the cowardice of the eagle when it is suddenly surprised or meets with unexpected re-

sistance; a game cock put into a cage with a full-grown male at once attacked the eagle and beat him in the most approved manner, and even the common cock has fairly put this cowardly bird to flight. The females are somewhat larger, braver, and fiercer than the males. Like the golden eagles, these birds live to a great age. They are generally seen in pairs, and the union appears to last for life. Along the southern Mississippi incubation commences in January; the nest is placed on the top of a tall tree, and not on cliffs like the golden eagle's; it is rudely made of sticks, turf, weeds, and moss, 5 or 6 ft. in diameter, used year after year, and added to annually. The eggs are usually two, of a dull white color. The attachment of the old birds to their young is great. The weight of the adult male is from 6 to 8 lbs., that of the female from 8 to 12. The flesh of the young is said to be palatable, having the taste of veal. Franklin, as quoted by Audubon, laments that this bird should have been selected as the emblem of the United States, on account of its cowardice, tyranny, and general ill condition. As observed in confinement, the female not only attacks and abuses the male, but stretches her wings to the utmost extent, attempting to cover with them every piece of food placed in the cage. The name of bald eagle is really a misnomer, as the head is as thickly feathered as in any species; the proper name is white-headed eagle.—The bird of Washington (*H. Washingtonii*, Aud.) was first described by Audubon ("Ornithological Biography," vol. i., p. 58), and seems not to have been seen by any other ornithologist; he first saw it on the upper Mississippi in February, 1814; a few years after he met with a pair near the Ohio river in Kentucky, which had built their nest on a range of high cliffs; two years after the discovery of the nest he killed a male which was the subject of his description; after this he saw two other pairs near the Ohio river. The flight of this is said to be different from that of the white-headed eagle, the former encircling a greater space, sailing nearer the surface of the earth, and darting spirally upon its prey. The bill was bluish black, with pale edges; the iris chestnut-brown; upper part of the head, hind neck, back, scapulars, rump, tail coverts, and posterior tibial feathers, blackish brown, with a coppery gloss; the throat, fore neck, breast, and abdomen light brownish yellow, each feather blackish brown in the centre; wing coverts light grayish brown, those next the body approaching the color of the back; primaries and tail dark brown; anterior tibial feathers grayish brown. The length is given at 3 ft. 7 in., extent of wings 10 ft. 2 in., bill $3\frac{1}{4}$ in., tarsus $4\frac{1}{2}$ in., and the weight $14\frac{1}{2}$ lbs.; this was a male, and of course the female would have been considerably larger. Though this bird is generally admitted as a species on the authority of Audubon, many ornithologists do not regard it as such; and from Audubon's own testimony

there seems sufficient ground for doubting the validity of the species.—The white-tailed or cinereous sea eagle of Europe (*H. albicilla*, Linn.), the young of which Audubon thinks bears the greatest resemblance to his bird of Washington, has at this age a blackish bill; head and hind neck dark brown, with white markings, disappearing with age; fore neck and breast brown, with brownish white marks; general color of the plumage light brown, with a dark streak on the middle of each feather. In the old bird the bill becomes yellow, the general plumage grayish brown, palest on the head and neck, and the tail white; the length is 3 ft., and the extent of wings 6 ft. 9 in. This species, called also osprey, ossifrage, and pygargus, is distributed over the northern portions of the old world; it feeds principally on fish, like our white-headed eagle, forcing the fish hawk to provide for it. It prefers cold climates, and the vicinity of the sea, though it visits the interior rivers and lakes; when un-

Cinereous Sea Eagle (*Haliaeetus albicilla*).

able to obtain fish, it feeds upon sea birds, young seals, and any small animals which it can surprise. Its flight is neither so elevated nor so rapid as that of the previously described species. The nest is placed on cliffs near the sea, and the eggs are two, of a dirty white color; incubation takes place in April.—The northern sea eagle (*H. pelagicus*, Pallas) is the largest of the family, and inhabits the islands of Alaska and northeastern Asia. The total length of the female is $3\frac{3}{4}$ ft.; the wings are shorter than usual, and the tail is wedge-shaped. In the adult the bill and the legs are yellow; the general plumage brownish black, with a large frontal space, greater wing coverts, abdomen, and tail, white. In the young the tail is white, with brownish black marks, the quills black, the secondaries and tertiaries white at their bases; other parts dull brownish black. It is a fishing eagle, though it occasionally captures birds and quadrupeds. According to Pallas, it breeds in northeastern Asia.—There are several genera of smaller

eagles, as the crested eagles (*spizaetus*, Vieill.). The black-tufted eagle (*S. ornatus*, Daud.) is as large as a raven, black, with a long tuft hanging from the occiput, and the edge of the wings and bands under the tail whitish; the crest is mixed with white; the thighs and tarsal feathers banded with black and white; tarsus feathered to the toes; it inhabits South America.

Reptile Eagle (*Morphnus urubitinga*).

Other species are found in Africa and the Indian archipelago, where they live in jungles and woods, pouncing on pheasants, hares, and similar animals passing underneath; they also seize prey on the wing. The reptile eagles (*morphnus*, Cuv.) are peculiar to South America; they live in the forests, feeding on reptiles, small animals, and birds. A well known

Brazilian Eagle, or Caracara (*Polyborus tharus*).

species is the *M. urubitinga* (Gmel.); this is black, without a crest, rump and lower part of the tail white; the long tarsi are bare of feathers. The harpy eagles (genus *thrasaetus*, Gray, or *harpyia*, Vieill.) are peculiar to South America; they will be described in the article HARPY. The genus *pandion* (Sav.) will be described under FISH HAWK, the common name

of the best known species.--The caracara, or Brazilian eagle, does not belong to the *aquilinae*, but to the *polyborinae*, a subfamily coming nearest to the vultures; this bird (*polyborus tharus*, Molina) is of various shades of brown, with streaks and mottlings of brownish black; wings barred with white, and the tail coverts dull white barred with dusky; tail grayish white, with 16 narrow bars and a terminal band of blackish brown; the length is about 2 ft. and the extent of wings 4 ft., the bill $2\frac{1}{2}$ in. It is found from Florida to Brazil, and it feeds on carcasses, small reptiles, and birds; it has the habits of the vultures, with the additional power of carrying prey in its talons; it walks like the turkey buzzard; its flight is rapid and graceful.—The eagle, in mythology, is the sacred bird of the Hindoo Vishnu and of the Greek Zeus. In the Roman ceremony of apotheosis an eagle ascended from the burning catafalque, and was believed to bear the soul of the deceased to Olympus. In the Scandinavian mythology, it is the bird of wisdom, and sits in the boughs of the tree *Yggdrasill*.—The Etruscans were the first who adopted the eagle as the symbol of royal power, and bore its image as a standard at the head of their armies. From the time of Marius it was the principal emblem of the Roman republic, and the only standard of the legions. It was represented with outspread wings, and was usually of silver till the reign of Hadrian, who made it of gold. The double-headed eagle was in use among the Byzantine emperors, to indicate, it is said, their claim to the empire both of the East and the West; it was adopted in the 14th century by the German emperors, and afterward appeared on the arms of Russia. The arms of Prussia are distinguished by the black eagle, and those of Poland bore the white. The white-headed eagle is the emblematic device of the United States of America, is the badge of the order of the Cincinnati, and is figured on coins. Napoleon adopted the eagle for the emblem of imperial France; it was not, however, represented in heraldic style, but in its natural form, with the thunderbolts of Jupiter. It was disused under the Bourbons, but was restored by a decree of Louis Napoleon (Jan. 1, 1852).

EAGLE, a gold coin of the United States, of the value of \$10, first coined in 1795, as provided by the act of congress of April 2, 1792, of the fineness of 22 carats ($916\frac{2}{3}$ thousandths), and weighing 270 grains, thus containing $247\frac{1}{2}$ grains of pure gold. The silver dollar contained at the same time $371\frac{1}{2}$ grains pure silver, the ratio of valuation of silver to gold being as 15 to 1. An ounce of pure gold being worth more than 15 of silver in Europe, our gold coins continued to be exported until the act of June 28, 1834, substituted the ratio of 16 to 1 by reducing the fineness of the eagle to $899\frac{1}{16}$ thousandths, and its weight to 258 grains, being 232 grains pure gold. By the act of Jan. 18, 1837, the fineness of the eagle, as of all the other gold and silver coins, was

raised to 900 thousandths, its weight remaining as before, 258 grains, of which $232\frac{2}{5}$ were pure gold; and at these rates it continues to be coined. There are also a half eagle, first coined in 1795, a quarter eagle, first coined in 1796, and a double eagle, first coined in 1849. These coins are a legal tender for all sums. The number of coins of each kind produced at the mint and branches from their organization to June 30, 1873, is as follows:

Double eagles.....	32,336,404	Half eagles	13,959,542
Eagles.....	5,553,249	Quarter eagles.....	10,417,561

The total number of pieces is 62,267,056, valued at \$798,103,682 50. (See COINS.)

EAGLE WOOD, a fragrant wood containing an abundance of resin and an essential oil, highly esteemed for its perfume by Asiatics, who burn it as incense. The tree from which it is obtained is a native of the East Indies, and belongs to the genus *aquilaria*. There are three varieties, *A. Malaccensis* or *ovata*, indigenous to Malacca and Siam, where it is called *garos*, and to which the name eagle wood is more generally applied; *A. agallochum*, a large tree with alternate lance-shaped stalked leaves, a native of Silhet, where it is called *ugoor*, supposed to be the *calambac* or *agallochum* of the ancients; and *A. secundaria*, a tree whose wood is white and inodorous in a healthy state, but when attacked by a disease to which it is subject becomes colored and gives out a powerful scent. The Cochin Chinese are said to make their paper from its bark. Eagle wood is largely used in India and Siam, but the greater part of it is exported to China. According to French authorities, it was burned as a perfume in the imperial palace in the time of Napoleon I. In India it is used also as a cure for the gout, and it is sometimes prescribed in Europe in rheumatic affections. Its Malayan name is *agila*, whence the wood was called by the Portuguese *pão d'agila*, which became corrupted into *pão d'aquila*, and finally *pão d'aquila* or eagle wood.

EAR, the organ of hearing. Anatomists divide it into the external, the middle, and the internal ear. The first consists of the visible external organ, a cartilaginous and fleshy structure, of the form best adapted to collect the atmospheric vibrations, and the meatus or tubular opening leading to the tympanum. The tympanum is a firm fibrous membrane stretched across this opening, whose office, as its name implies, is to communicate vibrations like the head of a drum. The middle ear is a cavity about the form and size of a kidney bean; from its lower point a tubular canal descends to the side of the pharynx, where it terminates in a trumpet-like expansion; this canal is called the Eustachian tube. Across the middle ear is stretched a chain of three small bones, connected with each other by cartilage and tendon. These are the *malleus* or mallet, the *incus* or anvil, and the *stapes* or stirrup, each named from some fancied resemblance. The

office of this chain, which is attached to the tympanum at one end, and to the membrane covering the *foramen ovale* at the other, is to transmit the vibrations of the air; to aid in this, they are controlled by three minute muscles, which serve to regulate the tension of the membrane of the tympanum, and the pressure of the stapes against the membrane of the *foramen ovale*. The internal ear, also called the labyrinth, to which the external and middle ear are but the anterooms, consists of the vestibule, the three semicircular canals, and the cochlea. The vestibule is an irregular cavity shut out from the middle ear by the membrane covering the *foramen ovale*, and communicating with the semicircular canals by five openings, two of these canals being joined at one end. The cochlea, as its name

The Parts of the Auditory Apparatus.—*a*, external ear; *b*, auditory meatus; *c*, membrane of the tympanum; *d*, head of the malleus; *e*, bony process, and *f*, handle of the malleus; *g*, incus; *h*, *i*, short and long processes of the incus; *k*, *l*, articulation of incus and stapes; *m*, stapes; *n*, *o*, *p*, semicircular canals; *q*, cochlea; *r*, apex of the cochlea; 1, 2, 3, malleus, incus, and stapes, separated from each other and highly magnified.

implies, is a bony structure resembling in form a snail shell; internally it is divided by a lamina, bony, ligamentous, and muscular, into two cavities called the *scala vestibuli* and the *scala tympani*, which communicate at the top of the cochlea, in a curved channel called the *helicotrema*. The *modiolus*, or bony axis of the cochlea, has numerous orifices, through which pass the filaments of the auditory nerve. The whole internal ear is lined with a delicate serous membrane, containing a fluid called perilymph. Within the vestibule and the semicircular canals, we find the membranous labyrinth; in the vestibule it consists of two membranous sacs, one called the *utricle* and the other the *sacculus*, communicating with each other and extending in slender tubes through the semicircular canals, of which they only occupy about one third; in the vestibule and in the ampullæ of the semicircular canals these

sacs receive the nervous filaments, and are thus connected with the serous membrane lining the labyrinth, but everywhere else they are free, and separated from it by the perilymph, while their cavities contain a similar fluid called endolymph. In the vestibular portion is found a crystalline powder, proved by chemical experiment to be carbonate of lime, and denominated *otolithes*; the office of this is supposed to be to communicate the vibrations to the nervous surfaces. The filaments of the auditory nerve terminate by loops, or minute points, in the sacculus, the utriculus, the ampullæ of the membranous semicircular canals, and the membranous lamina which divides the cochlea. In the process of hearing, the vibrations of the atmosphere, caused, we will say, by touching one of the keys of a piano, pass toward the external ear, where they are collected and concentrated by its peculiar form and structure; thus concentrated, they pass along the canal to the tympanum, where they produce a vibration; this vibration is communicated by the chain of bones to the membrane covering the foramen ovale, by which it is passed to the fluid contents of the vestibule and to the sacs, and thus reaches the nervous surface, which is expanded over the whole labyrinth, and produces the sensation of sound. The internal and middle ear are situated wholly within the temporal bone, which is here much thicker and harder than elsewhere, in order to protect the delicate and complicated structure from injury.—In the article **DEAF AND DUMB** we have spoken in general terms of the causes which induce deafness; but we may say here that while congenital deafness is usually the result of deficiency or malformation of some portion of the organ, thus preventing the transmission of the vibration or sound wave, accidental deafness usually arises from mucous secretions, the result of inflammation, clogging or thickening the membranes of the middle ear, or ulceration attacking the little bones and causing their discharge; inflammation of the serous membrane of the labyrinth; or paralysis of the auditory nerve. As may be supposed, the cure of complete deafness is exceedingly rare.—The sense of hearing, like most of the senses, is capable of a much higher cultivation than is generally given to it. The blind, to whom touch and hearing make up in part for the loss of vision, acquire remarkable powers of hearing. They will hear a footstep or the opening of a door at a distance at which ordinary persons cannot distinguish a sound. In some brain affections there is more or less morbid sensitiveness of hearing; and in that condition of the nervous system brought on by long continued and intense excitement, and which often terminates in insanity, the same phenomenon is observed.—The form of the external ear varies materially in different races of men, and still more in the animal tribes. In the Caucasian race it is of moderate size, well formed, and neither

very prominent nor pressed closely to the head. In the Malay and Mongolian it is large, ill-proportioned, the lobe naturally long, and the whole ear standing out prominently; in the Indian race the conformation is similar to the Mongolian, though less prominent; in the negro the ear is flat, broad, and adheres so closely to the head as to give the idea of having been fastened there by a bandage. Of the inferior animals, the mammalia only have an external ear; in birds it is merely a small orifice; in fishes, when it exists, it is covered by the skin, as it is also in reptiles. The variety in its form in mammals extends even to different varieties of the same animal. The drooping ear of the King Charles and other spaniels contrasts forcibly with the erect prominent ear of the foxhound and the Esquimaux dog; and both differ greatly from the short open ear of the bulldog. The horse has a sensitive and well formed ear, though of small size; while the ass, with no better powers of hearing, is supplied with long aurial appendages which seem most adapted for fans. The elephant has a small ear as compared with his great size, though the flap of skin which protects it is of considerable dimensions. The carnivora generally have small but very quick ears, and they usually possess erectile power, which enables them to throw them into shapes in which they will most readily catch the sound wave. The mole, though his ear is hardly discernible in the fine fur which covers it, is yet very quick of hearing. Of all the mammals, the bat tribe possess the largest ears in proportion to the size of their bodies, the *phyllostomus* and the *megadenus* in particular being provided with these appendages so large as to form nearly one third of the superficial extent of their bodies. Among savage and half-civilized tribes the idea prevails that the lengthening of the lobe of the ear by heavy ornaments, and the enlargement of the perforations made for attaching them, both add greatly to the beauty of the wearer. In the Burmese statues of Gaudama he is represented in a sitting posture, and the lobes of his ears extend to the level of his lap. Among the African tribes the perforation in the ear is enlarged so that a stick an inch or more in diameter may be thrust through it, and some of them use the ear instead of a pocket to carry small articles.

EARL, the most ancient title of nobility used in Great Britain. Under the early Saxon kings the powerful nobles to whose charge shires or territories had been committed were called *caldormen*, literally elder men (whence the modern alderman), a term equivalent to the Latin *senior* or *senator*, and given in Latin documents as *princeps*, *dux*, or *comes*. The Danes subsequently applied the term *eorle*, which signified originally a man of noble birth, as opposed to the *eorl* or churl, to the same men who had borne the title of *caldormen*. The Saxon earl derived his title solely from his

office, which was originally in the gift of the crown, and in recompense for his services received a part of the revenues of his province to his own use. Toward the close of the Saxon dynasty these provincial governors not only greatly enlarged their authority, but claimed the dignity as hereditary; and in the time of Edward the Confessor the whole kingdom was divided between five powerful earls, including Godwin and his sons Harold and Tosti, of whom Harold subsequently usurped the throne. After the Norman conquest the territorial possessions of the Saxon nobility were declared forfeited, and with many newly created fiefs were distributed among the chief followers of William the Conqueror, who thereupon severally assumed the title of count, from the Latin *comes*. But this title was very soon replaced by the old one of earl, while the territory from which the new dignitary received his name or over which he exercised jurisdiction was thenceforth called a county, instead of a shire as previously under the Saxons, and the consort of the earl became a countess. According to Cruise, there were three sorts of earldoms under the early Norman kings: the first and highest, where the dignity was annexed to the possession of a whole county, with the *jura regalia*, in which case the county became a county palatine, and the person created earl of it exercised all the authority of a sovereign; the next, where the earl was entitled to the third part of the revenues of the county court; and the third, where a tract of land was erected into a county and granted with civil and criminal jurisdiction to be held *per servitium unius comitatus*. This statement, however, is open to controversy, and Sir Harris Nicolas is of opinion that the Norman earls, excepting in the counties palatine, possessed no jurisdiction over the counties from which they were denominated, the dignity being of a nature altogether personal. At present the title conveys no local jurisdiction or revenue, and is no longer confined to the names of counties, but may be derived from those of towns or villages, or of families. It remained the highest hereditary dignity in England until the reign of Edward III., when the first dukedom was created, and is now the third order of the British nobility, being next below that of marquis, and above that of viscount. The style of an earl is "right honorable," and he is officially addressed by the crown as "our right trusty and well beloved cousin," an appellation attributed to Henry IV., who had his own reasons for flattering the powerful earls, with nearly all of whom he is said to have been allied by birth or marriage, by frequent allusions to the relationship. He bears also on some occasions the title of "most noble and puissant prince." The coronet of an earl consists of a circle of gold chased as jewelled, upon which rise eight pyramidal points, gold, each point bearing a large silver ball, while between the points close to the rim of the coronet are straw-

berry leaves of gold. The cap is of crimson velvet with turned ermine and a golden tassel. Earls are now created by letters patent, in place of the old practice by which the sovereign girded on the sword of the new earl and invested him with mantle and coronet. In 1872 there were 110 earls (and one countess) in the peerage of Great Britain, including 32, Scotch and 21 Irish earls; besides which there were 34 earls in the Scotch and 20 in the Irish peerage; 9 Scotch and 10 Irish earls had seats in the house of lords as representative peers.—The EARL MARSHAL is an officer of state in England, who directs important ceremonies, takes cognizance of matters relating to honor, arms, and pedigree, and proclaims the declaration of war or of peace. The office was established in the reign of Richard II., who conferred it upon Thomas Mowbray, earl of Nottingham, and is now hereditary in the family of Howard, the head of which, the duke of Norfolk, is the present earl marshal of England.

EARLE. I. Pliny, an American inventor, born in Leicester, Mass., Dec. 17, 1762, died there, Nov. 19, 1832. In 1785 he became connected with Edmund Snow in the manufacture of machine and hand cards for carding cotton and wool. Mr. Earle at first made them by hand, but soon invented the machine still in use for their manufacture, by which the labor of a man for 15 hours could be performed in as many minutes. Aside from his inventive genius, he deserves a record for his extensive attainments in science and literature. **II.** Pliny, an American physician, son of the preceding, born in Leicester, Mass., Dec. 31, 1809. He was educated at the Friends' school in Providence, R. I., where he was subsequently employed as a teacher. He received his diploma of M. D. in 1837, and in 1840 was appointed resident physician of the insane hospital at Frankford, Pa., where he remained about two years. In 1844 he was appointed physician to the asylum for the insane at Bloomingdale, N. Y., where he remained till April, 1849, when he visited the insane hospitals of England, Belgium, Germany, Austria, Poland, and a part of those of France. In 1847 he declined an appointment of visiting physician to the New York city lunatic asylum, but accepted it in 1853. In 1841 he published a small volume of poems entitled "Marathon and other Poems;" and in the same year "Visit to thirteen Asylums for the Insane in Europe." In 1848 he published the "History, Description, and Statistics of the Bloomingdale Asylum." After his return from his second European tour, he published in the "American Journal of Insanity" a series of articles on institutions for the insane in Germany and Austria, which were subsequently collected in a volume. Another series of articles on "Bloodletting in Mental Disorders" was published in 1854. His other contributions to the medical and psychological journals are very numerous. **III.** Thomas, a writer on law, brother of the preceding, born

in Leicester, Mass., April 21, 1791, died in Philadelphia, July 14, 1849. In 1817 he removed to Philadelphia, and engaged in mercantile pursuits for a few years, and afterward became distinguished as a lawyer and journalist. He edited in succession the "Columbian Observer," "Standard," "Pennsylvanian," and "Mechanics' Free Press and Reform Advocate." In 1837 he took an active part in calling a convention to revise the constitution of Pennsylvania, was a prominent member of it, and is believed to have made the original draft of the new constitution. At this time he lost the support of the democratic party by advocating the extension of the right of suffrage to negroes. In 1840 he was the candidate of the liberty party for vice president. After that period he mingled little in political affairs, and devoted himself almost entirely to literary pursuits. His first published work was an "Essay on Penal Law," which was followed by an "Essay on the Rights of States to alter and annul their Charters," a work which elicited the approbation of Thomas Jefferson; a "Treatise on Railroads and Internal Communications" (1830); a spelling book for schools; and a "Life of Benjamin Lundy." At the time of his death he had nearly completed a history of the French revolution.

EARL MARSHAL. See **EARL**.

EARLY, a S. W. county of Georgia, bordering on Alabama, bounded W. by the Chattahoochee river; area, 500 sq. m.; pop. in 1870, 6,998, of whom 4,172 were colored. The surface is a fertile plain, watered by Spring creek and several of its branches, and occupied by corn and cotton plantations, interspersed with forests of oak and yellow pine. The Chattahoochee is navigable along the border of the county by steamboats, and the smaller streams furnish good water power. On the bank of Colanoka creek is a remarkable ancient mound, 75 ft. high, with a level surface on the top 240 by 90 ft. in extent. The chief productions in 1870 were 129,092 bushels of Indian corn, 11,201 of oats, 22,614 of sweet potatoes, and 3,461 bales of cotton. The value of live stock was \$193,961. Capital, Blakely.

EARLY, Jubal A., a general of the Confederate States, born in Virginia about 1815. He graduated at West Point in 1837, and was appointed a lieutenant of artillery, but soon resigned, studied and practised law, and was elected to the legislature of Virginia. During the Mexican war he was major of a regiment of Virginia volunteers. Upon the breaking out of the civil war he entered the confederate army, and commanded a brigade at Bull Run, Cedar Mountain, and Fredericksburg. In May, 1863, he commanded the division which held the lines at Fredericksburg, while Lee was fighting the battle of Chancellorsville. He also commanded a division at Gettysburg. In 1864 he was sent to the valley of the Shenandoah, where his operations were at first very successful. In July he crossed the Potomac, gained several actions,

and even threatened Washington, but was obliged to retreat. Toward the end of the month a portion of his cavalry advanced into Pennsylvania as far as Chambersburg, which they burned. He was defeated by Sheridan on the Opequan (Sept. 19), at Fisher's Hill (Sept. 22), and at Cedar creek (Oct. 19); and in March, 1865, he was totally routed by Custer at Waynesborough. On March 30 he was dismissed by Lee from the command in the valley. After the close of the war he spent some time in Europe, and returning resumed the practice of law at Richmond. In 1867 he published "Memoirs of the Last Year of the War."

EAR SHELL (*haliotis*), a marine gasteropod mollusk, so called from its resemblance in shape to an ear. The spire is small and flat, the aperture large and without operculum, and the interior pearly and iridescent; the exterior is dull, of a brownish or mottled color. The outer angle is perforated by a series of holes, growing smaller toward the spire, where they are closed, forming tubercles; these are the openings for the respiratory currents, and also for the passage of tentacles. The genus includes about 75 living species, and a few have been found fossil in the middle tertiary epoch; they are met with in the temperate and tropical seas the world over, and are used in Japan and in the Channel islands for food, being made tender by beating. The common species (*H. tuberculata*) is often called the ormer. Some of the species are 6 to 8 in. long and 5 or 6 wide. They are used for inlaying and other ornamental purposes, and also for decorating houses, fixed in the plastered wall. They are usually found in deep water, and are obtained at low tide, adhering very firmly to rocks by means of the large foot, like the limpet.

EARTH, the globe on which we live, and the third planet in order of distance from the sun. The earth is a rotating globe, somewhat compressed or flattened at the poles. Its mean diameter is 7,912 m., its polar diameter 7,898 m., and its equatorial diameter 7,926 m. It travels in a nearly circular orbit around the sun, at a mean distance of about 91,500,000 m. When nearest to the sun the earth is about 90,000,000 m. from him, and when at her greatest distance about 93,000,000 m. She completes her circuit around him in 365.2564 days, rotating on her axis in 23h. 56m. 4s. of mean solar time.—It was supposed by the first astronomers and geographers that the earth was a vast fixed plane, probably circular, and that the heavenly bodies were carried around this fixed earth, passing alternately above and below its level. The discovery that the earth is not a plane has been ascribed to Thales of Miletus (born about 640 B. C.), and it is said that he ascribed to it a spherical figure, but Anaximander judged it to be cylindrical. Gradually, as more and more of the earth became known through travels and explorations, its real figure and dimensions be-

came more clearly recognized. Voyages northward and southward were found to lead to a steady rising or sinking of the north pole of the heavens, a circumstance which showed that there must exist a curvature in that direction; while voyages eastward and westward, being found by careful observation to lead to a shortening or lengthening of the intervals between noon and noon, proved that in that direction also the earth is curved. We pass over the history of such researches, in order to give more space to the exact investigations of modern times. The measurements made on the assumption that the earth is a true sphere had been conducted to a sufficiently satisfactory issue exactly at the time when Newton's discovery of gravitation was about to lead him to the inference that the earth must be somewhat oblate. Picard showed in 1679 that each degree of a great circle of the earth contains rather more than 69 m., instead of 60 as had been supposed. Soon after Newton pointed out that if the earth were regarded as originally a homogeneous fluid rotating mass, its shape would not be globular, but so far compressed that the polar diameter would bear to an equatorial diameter the ratio 229 to 230. By a singular misapprehension the elder Cassini was led to imagine that if the earth were thus compressed the degrees of latitude must diminish as either pole is approached; an obvious mistake, seeing that the polar flattening implies diminished polar curvature. But Cassini's actual measurements seemed to indicate a diminution of the degrees of latitude toward higher latitudes; and when it was pointed out to him that his results were the reverse of what Newton's theory required, he maintained their accuracy, and the inference that the earth is a prolate instead of an oblate spheroid; in other words, he maintained that the polar diameter exceeds the equatorial. The controversy hence arising led to the famous earth-measuring expedition of 1735-'45. Bouguer, La Condamine, and Godin left Paris for Peru, where they were joined by Antonio d'Ulloa and Jorge Juan from Spain. Maupertuis with four others sailed to Bothnia, where they were joined by the Swedish astronomer Celsius. The measurements made in both places were most satisfactory, repeated observations leading to results differing only a few feet per mile. The length of the degree in Peru was found to be 362,790 ft., while the estimated length of a degree in Sweden amounted to 365,744 ft. The difference was far too great to be ascribed to errors of measurement, and it was justly regarded as demonstrative of the general accuracy of Newton's reasoning. However, the value actually ascribed to the compression by Newton (on a certain hypothesis as to the earth's structure) was not confirmed by these observations; on the contrary, it appeared that the compression was 1 in about 300, instead of 1 in about 230. Subsequent observations, as well as considerations founded on the attraction exerted by the moon upon the

bulging equatorial parts of the earth, have shown that the compression has not so great a value as Newton's hypothesis required; nor need we wonder at this when we remember that under the influence of attraction the interior parts of an originally fluid earth would necessarily be much denser than the outer parts, and that Newton himself only introduced the hypothesis of homogeneity to simplify his calculations. The following list of measurements of degrees in different latitudes indicates what has been done since such labors were first undertaken, and serves to show how satisfactorily all observations agree in pointing to an increase of the length of a degree with increase of latitude, whether north or south of the equator:

COUNTRY.	Latitude of middle of arc.	Arc measured.	Mean length of a degree at the middle latitude in feet.
Sweden.....	66° 20' 10" N.	1° 37' 19" 0"	365,744
Sweden.....	66 19 37	0 57 30.4	367,086
Russia.....	58 17 37	3 35 5.2	365,363
Russia.....	56 3 55.5	8 2 25.9	365,291
Prussia.....	54 55 26.0	1 30 29.0	365,420
Denmark.....	54 8 13.7	1 31 53.3	365,087
Hanover.....	52 32 16.6	2 0 57.4	365,300
England.....	52 35 45	3 57 13.1	364,971
England.....	52 2 19.4	2 50 23.5	364,951
France.....	46 52 2	8 20 0.3	364,572
France.....	44 51 2.5	12 22 12.7	364,572
Rome.....	42 59	2 9 47	364,262
United States.....	39 12	1 28 45.0	363,786
India.....	16 8 21.5	15 57 40.7	363,044
India.....	12 32 20.8	1 34 56.4	362,956
Peru.....	1 31 0.4 S.	3 7 3.5	362,790
Cape of G'd Hope.....	33 18 30	1 13 7.5	364,713
Cape of G'd Hope.....	35 43 20.0	3 34 34.7	364,060

These measurements are due to the following mathematicians and observers: The two Swedish to Svanberg and Maupertuis; the two Russian to Struve and Tenner; the Prussian to Bessel and Bayer; the Danish to Schumacher; the Hanoverian to Gauss; the two English measurements to Roy and Kater; the two French to Lacaille, Cassini, Delambre, and Mechain; the Roman to Boscovich; the American to Mason and Dixon; the Indian to Lambton and Everest; the Peruvian to La Condamine and Bouguer; and lastly, the two measurements at the Cape of Good Hope to Lacaille and Maclear. Later measurements made in India by Sir George Everest give 363,606 ft. for the length of a meridional degree in lat. 26° 49', and 363,187 ft. for the length in lat. 21° 5'. Combining all the observations, and attributing minor irregularities either to errors of observation or to local peculiarities of the earth's surface, we deduce the following table of the lengths of degrees of latitude in feet for every tenth degree:

LATITUDE.	Length of degree in ft.	LATITUDE.	Length of degree in ft.
0°.....	362,734	50°.....	364,862
10.....	362,843	60.....	365,454
20.....	363,158	70.....	365,937
30.....	363,641	80.....	366,252
40.....	364,233	90.....	366,361

It follows from the measurements that the compression of the earth is very nearly $\frac{1}{306}$. But it is believed that the compression is different for different longitudes; in other words, that the earth is not a figure of revolution. It will be interesting for the reader to compare the following three sets of results: First, as the result of comparing the best measurements before the recent Indian and Russian observations, we have—Earth's equatorial diameter 41,843,330 ft., or 7,924,873 m.; polar diameter, 41,704,788 ft., or 7,898,634 m.; difference of diameters or polar compression, 138,542 ft., or 26,239 m.; ratio of diameters, 302.026 : 301.026; compression, $\frac{1}{301.026}$; length of degree at equator, 362,732 ft.; length of degree in lat. 45° , 364,543.5 ft. Secondly, Sir John Herschel thus states the results obtained by Capt. A. R. Clark, R. E., from a combination of all the results which have been obtained, and especially those resulting from the recent extension of the great arcs surveyed in India and Russia: "The earth is not exactly an ellipsoid of revolution. The equator itself is slightly elliptic, the longer and shorter diameters being respectively 41,852,864 and 41,843,096 ft. The ellipticity of the equatorial circumference is therefore $\frac{1}{3283}$, and the excess of its longer over its shorter diameter about two miles. The vertices of the longer diameter are situated in lon. $14^\circ 23'$ E. and $194^\circ 23'$ E. of Greenwich, and of its shorter in $104^\circ 23'$ E. and $284^\circ 23'$ E. The polar axis of the earth is 41,707,796 ft. in length; and consequently the most elliptic meridian (that of lon. $14^\circ 23'$ and $194^\circ 23'$ E. of Greenwich) has for its ellipticity $\frac{1}{384.75}$, and the least elliptic (that of lon. $104^\circ 23'$ and $284^\circ 23'$ E. of Greenwich) an ellipticity of $\frac{1}{308.3}$." Thirdly, Gen. Schubert, in the memoirs of the imperial academy of St. Petersburg, arrives (by a mode of reasoning which Sir John Herschel regards as less exact) to a similar but not identical conclusion. "He makes the ellipticity of the equator $\frac{1}{388.35}$," says Herschel, "and places the vertices of the longer axis $26^\circ 41'$ to the eastward of Capt. Clark's. His polar axis, as deduced from each of the three great meridian arcs, the Russian, Indian, and French respectively, is 41,711,019 ft., 41,712,534 ft., and 41,697,496 ft., the mean of which, giving to each a weight proportional to the length of the arc from which it is deduced, is 41,708,710 ft." It may be added that the figure of the earth as thus determined accords well with the observed change of rate in a pendulum set swinging in different latitudes, as also with the observed values of precession and nutation (the motions of the earth's globe caused by the attraction of the sun and moon on the protuberant mass round the equator).—Next to the determination of the earth's figure, that of her density may be regarded as the most important terrestrial problem which men of science have attempted to solve. Newton was the first to show how the problem might

met would be deflected from the vertical by the attraction of a mountain. But Bouguer (born 1698) was the first to suggest that the method should be put in practice with direct reference to the problem of determining the earth's mass. The method is applied by means of the instrument called a zenith sector, a telescope with a graduated arc attached to its lower extremity and a plumb line to the upper. This telescope, pointed to the same star successively at two stations separated by a known distance, serves to show how much the centre of gravity changes in passing from one to the other; and it is known that for each 100 ft. of horizontal distance on a north and south line, the change of direction is very nearly one second of angle. But if one of the stations be at the foot of a mountain, the same change of direction is not observed, because the attraction of the mountain deflects the plumb line; and the effect is even greater if both the stations lie at the foot of a mountain, one on the northern side and the other on the southern. Thus, let us suppose that the two stations are separated by 4,000 ft.; then the difference in the direction of gravity would be about $40''$ if the stations were on a plain; but if a mountain separates them, this difference will be increased, because the positions of the lower ends of the plumb line, already tending to convergence in consequence of the fact that the earth's gravity is directed always toward the centre of the earth, are brought yet nearer together by the mountain's attraction. If this difference is carefully determined, and if the geological structure of the mountain is known, as well as its general shape and dimensions, it becomes possible to compare the density of the earth with the known mean density of the mountain. This method was first applied by Bouguer in 1738, on the flanks of Chimborazo; but as both his stations were on the southern side, he was unable to determine the direction of the plumb line by means of such an instrument as the zenith sector; he failed accordingly to obtain any trustworthy results. But in 1772 Dr. Maskelyne proposed to the royal society to renew the experiment on some mountain in Great Britain. Schellien was selected, and after a careful series of measurements and observations it was found that at stations separated by 4,364.4 ft. the difference in the direction of gravity was $54.6''$ instead of $42.94''$, the difference due to gravity; so that the double attraction exerted by the mountain was found to be $11.6''$. By a series of calculations devised by Cavendish and carried out by Dr. Hutton, the density of the earth was computed to be to that of the mountain as 17.804 to 9.933; and after carefully examining the geological structure of Schellien, Dr. Playfair inferred the probable mean specific gravity of the earth to lie between 4.56 and 4.87, that of water being unity. More recently Col. James, superintendent of the ordnance survey in Great Britain, has deduced a mean density

of 5.316 from observations made on Arthur's Seat, near Edinburgh.—Another method of determining the earth's density is based on the circumstance that the earth's attraction is less on a body raised to a considerable height above its surface than on a body at the sea level. Hence a pendulum of given length swings more slowly the higher it is raised above the earth's surface. Now if such a pendulum be taken to the summit of a mountain, it is clear that the reduction of the rate of swing will not be so great as the estimated reduction for the amount of elevation alone, simply because the attraction of the mountain will have an appreciable effect on the pendulum's rate. Thus as in the former case it becomes possible to compare the attraction exerted by the mountain with that exerted by the earth, and so to determine the density of the earth. From observations made on Mont Cenis by this method, Carlini and Plana deduced for the earth's mean density the value 4.950.—A third method may be described as the converse of that just mentioned. If a pendulum could be caused to swing at a great depth below the surface of the earth, it would swing more slowly than at the sea level. For, considering a spherical surface concentric with the earth's to pass through the place of the pendulum, the attraction of all the mass of the spherical shell outside that surface would produce no effect on the pendulum; while the sphere within that surface would exert a less influence on the pendulum than is exerted by the earth's mass on a pendulum at the sea level; for though the pendulum would be nearer to its centre, yet this cause could only be effective to increase attraction inversely as the squares of the radii of the two spheres, whereas the volume of the inner sphere would be less than the volume of the earth in the direct proportion of the cubes of the radii. But a pendulum placed at the bottom of a cavity, like a mine, would not have its rate reduced to the same extent, or might even have its rate increased. For, since the whole of the spherical shell just referred to exerts no attraction on the pendulum, the space dug out to form the mine should be occupied in order that the attraction of the shell should be *nil*; and when it is vacant there is wanting a portion of that matter whose attraction outward (or diminishing the earth's) is necessary to produce the equilibrium referred to. Failing, then, this attraction outward, the remainder of the shell in question must exert a certain amount of attraction inward, and according to the shape and extent of the cavity this attraction inward may cause the resultant attraction on the pendulum to be nearly or quite equal to, or even greater than, that at the sea level. And it is clear that if the geological structure of the region surrounding the mine is known, as well as the exact shape and extent of the mine, this method, like the last, supplies a means of determining the mean density of the earth. Prof.

Airy applied this method at the Harton colliery in 1854; but it is to be noted that he first tried the experiment, though unsuccessfully, in 1826 and 1828. "The two stations selected were exactly in the same vertical, excellently walled, floored, and ceiled. Every care was taken to secure solidity of foundation and steadiness of temperature. At each station (upper and lower) was mounted an invariable brass pendulum, vibrating by means of a steel knife edge upon plates of agate, carried by a very firm iron stand. Close behind this was a clock, and before it a telescope mounted so that coincidences of the pendulum of the clock might be accurately observed through a slit in front of the telescope. By this means the proportion of invariable pendulum swings to clock pendulum swings was found; and then, as the clock pendulum swings in any required time are denoted by the clock dial, the corresponding numbers of invariable pendulum swings at the two stations were determined. In order, however, to do this, the clock rates had to be frequently compared; this was done by means of an electrical apparatus. In this manner the pendulums were observed, with 104 hours of incessant observations, simultaneous at both stations, one pendulum (A) being above and the other (B) below; then with 104 hours, B above and A below; then with 60 hours, A above and B below; then with 60 hours, B above and A below. No less than 2,454 effective signals were observed at each station. The results showed that the pendulums suffered no injury in their changes, and that the acceleration of the pendulum on being carried down 1,260 feet was 214 seconds per day, or that gravity is increased by $\frac{1}{1760}$ part. It does not appear likely that this determination can be sensibly in error." From it, taking into account the structure of the region and the figure of the mine, Prof. Airy deduced for the earth's density the value 6.565.—The remaining method of determining the earth's density is that of comparing the earth's attraction directly with the attraction of large spheres of lead or other heavy metal. It was devised

Michell's
Torsion Balance.

by Michell, who also prepared the apparatus by means of which it was first applied by Cavendish in 1789. Two globes of lead, *f* and *g* in the engraving, are attached to the extremities of a strong horizontal bar, movable in a horizontal plane around its centre.

Above this centre a light horizontal rod, *a b*, is supported by a fine wire. Two equal balls of lead, *a* and *b*, about two inches in diameter, are attached to the ends of this rod; and the proportions of the instrument are so adjusted

that the distance between these two small spheres (about 6 ft.) is equal to the distance between the two large ones. When the rod bearing the two small spheres is in as nearly perfect equilibrium as possible, the bar bearing the globes of lead is rotated on its vertical axis until these globes are brought nearly into perfect contact with the small balls on opposite sides, as at *f* and *g*. Their attraction on these balls being thus called into play, they tend to draw the light rod from its position of rest. The amount of the torsion thus produced in the supporting wire is observed through a telescope placed some distance off, so as to avoid disturbing influences. Then the bar is turned round in a contrary direction until the large balls are again nearly in contact with the small ones, as at *h* and *k*, so that the fine rod is swayed in a contrary direction from its position of rest, and the torsion thus caused is observed as before. The mean of the two results indicates the actual amount of torsion which the attraction of the two large globes is capable of producing. The experiments of Cavendish gave the attractive force exerted by two leaden spheres, each 174 lbs. in weight, as equivalent to $\frac{1}{43 \frac{1}{10}}$ of a grain weight, and he thence computed the density of the earth to be 5.48 times that of water. Reich of Freiberg, in two series of experiments, made the density 5.438 and 5.582. The late Francis Baily made more than 2,000 experiments by this method, and deduced from them a density equal to 5.660. It is worthy of notice how closely the results obtained by Michell's method (or, as it is called, the Cavendish experiment) agree together. The inference appears to be that this method is more trustworthy than any of those before described. It is also remarkable that Newton had stated in his *Principia* that probably the mean density of the earth is five or six times that of water (*Verisimile est quod copia materiae totius in terra, quasi quintuplo vel sextuplo sit quam si tota ex aqua constaret*).—Sir John Herschel ("Outlines of Astronomy," 11th ed., p. 559) thus sums up the evidence hitherto obtained respecting the earth's density and mass: "The final result of the whole inquiry will stand as below, the densities concluded being arranged in order of magnitude:

	Density.
Schehallien experiment by Maskelyne, calculated by Playfair.....	4.718
Carlini, from pendulum on Mont Cenis (corrected by Giulio).....	4.950
Col. James, from attraction on Arthur's Seat.....	5.316
Reich, repetition of Cavendish experiment.....	5.438
Cavendish, result 5.480 corrected by Mr. Baily's re-computation.....	5.448
Baily's repetition of Cavendish experiment.....	5.660
Airy, from pendulum in Harton coal pit.....	5.665
General mean.....	5.441
Mean of greatest and least.....	5.639

Calculating on $5\frac{1}{2}$ as a result sufficiently approximative and convenient for memory; taking the mean diameter of the earth considered

as a sphere at 7,912.41 m., and the weight of a cubic foot of water at 62.3211 lbs., we find for its solid content in cubic miles 259,373 millions, and for its weight in tons of 2,240 lbs. avoirdupois each 5,842 trillions ($=5,842 \times 10^{18}$). The low specific gravity of the earth, compared with that which might be expected from the enormous pressure to which her interior parts are subjected and the compressible nature of their materials, has led some men of science to the conclusion that the temperature of the interior is sufficiently high to exert an important counteracting influence.—The principal motions of the earth are her rotation on her axis and her revolution around the sun. The main proofs of both these motions are found in the results of astronomical observation. The revolution of the earth around the sun is in particular placed beyond all possibility of question by the phenomenon called the aberration of light, which affects every star in the heavens, and is at once explained on the hypothesis of the earth's motion; while it remains absolutely without explanation, and even without the possibility of explanation, if the earth be regarded as at rest. And when the revolution of the earth is once admitted, her rotation must be admitted at the same time; for it would obviously be absurd to regard the sun's apparent annual motion around the heavens as due to a real motion of the earth around the sun, while at the same time the sun's apparent diurnal motion around the heavens was regarded as due to a real motion of the sun around the earth. But there are certain proofs of the earth's rotation which may be regarded as in a sense terrestrial, since they have no reference to the celestial bodies. Among these we may mention Foucault's experiments with the gyroscope and pendulum. The gyroscope as applied by him to this problem is a heavy disk or ring rapidly rotating in its medial plane, and so suspended as to be free to turn in any direction. Such a disk or ring tends to preserve the plane of rotation unchanged in position, and if the earth were not rotating would remain unchanged under the closest scrutiny. But as the rotation of the earth tends to change the position of the medial plane of the rotating body, the tendency before alluded to is called into action and causes the medial plane apparently to shift, while in reality it is only maintaining its position against the effects of the earth's rotation. The result is, that when carefully examined through a telescope the rotating disk or ring is seen to shift steadily in a direction opposed to that of the earth's rotation. Foucault's pendulum experiment depends on similar principles: the "plane of swing" of a pendulum tends to resist any motion by which it would be caused to take up a position intersecting its former one. Now, if a pendulum be set swinging in a north and south plane, a tangent to the arc of swing at its lowest point passes when produced through a point on the produced axis of the earth; and if the pendulum

continued to swing in a north and south plane while the earth rotated through any considerable angle, this tangent would continue to pass through the same point on the axis; in other words, the plane of swing would have taken up a position intersecting its former position. This at least would be the case for all points on the earth's surface except those lying on the equator. But the plane of pendulum swing resists the influence, thus causing it really to shift its plane, and therefore this plane apparently shifts from the north and south position; this apparent shifting being obviously greater or less according as the pendulum is further from or nearer to the equator. The experiments on this plan, when carefully conducted, have been found to accord perfectly with theoretical anticipations based on the theory of the earth's rotation. Another proof of the earth's rotation is founded on the fact that bodies let fall from a considerable height fall slightly to the east of the point which lies directly below the point whence they had been dropped. Newton showed that this should be the case, because the point of suspension, being further from the earth's centre than the point directly beneath it, has a greater velocity on account of the earth's rotation. The experiment is not an easy one, for many reasons; and it is only on the average of a great number of experiments that the tendency to easting can be established. Benzenberg in 1820 made a series of such experiments, letting 31 balls fall from a height of 235 ft., within a tower, upon a sheet of soft wax. He found the sum of deviation toward the north to be 46·4 Paris lines, toward the south 92·6 lines, toward the east 174·5 lines, and toward the west 50·5 lines. He repeated these experiments in an abandoned coal pit at Schlebusch in Rhenish Prussia, where the fall was 262 ft. Twenty-nine balls gave the following sums of deviation: toward the north 124 lines, toward the south 103 lines, toward the east 189 lines, and toward the west 42 lines. Lastly, a long and most convincing series of experiments was carried out on the same plan by Prof. Reich in the mines of Freiberg. He dropped 106 balls to a depth of no less than 488 ft. There was a balance of southerly deviations amounting to 48·76 lines, and a balance of easterly deviations amounting to 1,093·92 lines; so that the mean deviation toward the south was but 0·46 lines, or practically inappreciable, while the mean deviation toward the east was 10·32 lines. Thus we may regard the rotation of the earth as abundantly demonstrated, independently of any evidence afforded by the celestial bodies.—The various divisions of the earth's surface are described in the article GEOGRAPHY; its structure is treated in GEOLOGY. See also PHYSICAL GEOGRAPHY. The subject may be further studied in the following works: Steffens, *Beiträge zur innern Naturgeschichte der Erde* (Berlin, 1801); Ritter, *Die Erdkunde im Verhältnisse zur Natur und Geschichte des*

Menschen (2d ed., 19 vols., Berlin, 1822-'59), and other writings of the same author; Steinhäuser, *Neue Berechnung der Dimensionen des Erdsphäroids* (Vienna, 1858); Burmeister, *Geschichte der Schöpfung* (Leipsic, 7th ed., 1867); Sandberger, *Der Erdkörper* (Hanover, 1856); Berghaus, *Was man von der Erde weiss* (4 vols., Berlin, 1860); Figuier, *La terre avant le déluge* (8vo, Paris, 1862); Häckel, *Natürliche Schöpfungsgeschichte* (8vo, Berlin, 1868); Reclus, *La terre* (2 vols., Paris, 1867-'8; Woodward's translation, 1871); Newton's *Principia*; Laplace, "System of the World," Harte's translation; Humboldt, "Cosmos" (5 vols., 1844-'58); Guyot, "Earth and Man" (revised ed., Boston, 1858); Sir John F. W. Herschel, "Outlines of Astronomy" (11th ed., 1872).
